This little book gives a classification of diseases of the heart in accord with the nomenclature approved by the American Heart Association, which is based on the etiological, anatomical, physiological and functional criteria for diagnosis It is also intended to serve as a guide to cardiac diagnosis It gives the essential points briefly but clearly Students of cardiology will find this book most useful

E. E. C.

PROBLEMS IN SURGERY University of Washington Graduate Medical Lectures, 1927 By GEORGE W CRILE, M.D Edited by AMY F ROWLAND Octavo of 171 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, $4 00

One hundred and seventy pages of authoritative advice on the management of acute infections, of malignant and premalignant conditions, of the bad-risk patient and other vital subjects, spiced with a chapter on the interpretation of normal and pathological conditions interms of a bipolar mechanism

As a practical guide in the daily problems of surgery this comprehensive little volume is most valuable and instructive. Its theoretical chapters are fascinating As all works coming from Dr Crile's pen this book should be read and re-read by everyone who wishes to know of the best.

GEO WEBB.

THE ELEMENTS OF THE SCIENCE OF NUTRITION By GRAHAM LUSK, Ph.D., Sc.D Fourth Edition Octavo of 844 pages Philadelphia and London, W B Saunders Company, 1928 Cloth, $7 00

The study of nutrition is so intimately connected with the study of the chemical composition of the body that a review of one is a review of the other No review of a work of this dimension can adequately express the value of the work. Lusk stands as one of the first letters in the alphabet of education of all present-day doctors This edition will further entrench his position, as it is replete with information of value, as well of historical importance.

The chapter on the nature of the feces contains information that is not in line with the popular conception of the formation of that type of excrement. Evidence is presented to show that normal feces are an excretion by the bowel, plus a very small quantity of bacteria by weight, with but slight remains of food. The bowel then becomes an organ similar to the kidneys in function, and not like the exhaust pipe of a threshing machine. The evidence presented opens up wide areas for the dreamer concerning the difficulties of man It also puts in a poor light many therapeutic practises of this day

The data on the value of finely milled flours also makes it difficult for one of New York's greatest dictators on foods to hold himself in good grace. It makes nothing short of a fool of McCann

The forward look of the early portion of the book takes somewhat of a drop when it comes to the consideration of individual diseases The brief notes on the treatment of diabetes do not add to the value of the book, in fact detract. This may be said to a certain extent of the other diseases considered.

The book is of mestimable value to all interested in nutrition.

J ARTHUR BUCHANAN

OUR NEIGHBORS

FAITH HEALING IN WEST VIRGINIA

The *West Virginia Medical Journal* for March devotes four pages to a Christian Science bill which passed the Senate but was unanimously rejected by the House. The *Journal* allows a representative of the Christian Science Church to use three columns in arguing for the bill The writer quotes the West Virginia law defining the practice of medicine as follows

"The term 'practice of medicine and surgery' as used by this act shall be construed to be treatment of any human ailment or infirmity by any method To open an office for such purpose or to announce to the public in any way a readiness to treat the sick or afflicted shall be deemed to engage in the practice of medicine and surgery within the meaning of this act, provided, this clause shall not apply, however, to regularly registered optometrists"

The writer continues

"It can be readily seen that the use of the words, 'by any method,' viewed from the standpoint of treatment by prayer as a religious doctrine, sets up a conflict with the following guarantee of religious freedom, contained in Article III, Section 15, of the Constitution"

The writer next quotes Article III, Section 15 of the Constitution, guaranteeing religious freedom He evidently claims that anything done in accordance with a religion (Voodoo sacrifice, for example), is permitted by the Constitution

The article continues

"Engrossed Senate Bill No 93 proposes to remedy this plainly apparent conflict by inserting in Chapter 150 a new section, to be known as Section 9-a, which reads as follows

"'None of the provisions of this chapter or of the laws of this state regulating the practice of medicine and surgery shall apply to persons who only practice Christian Science or the religious tenets of their church without the use of any drug or material remedy'"

The writer resorts to the familiar plea of the cultist that every person has the right to choose the healing method that he prefers when he says

"It is certainly not intended that one should be required to take a medical course and pass an examination thereon before the State Board of Health before being permitted to pray for the recovery of the sick

"In closing, I should like to state that the practice of Christian Science does not endanger the public health, that those who practice Christian Science healing only do so at the request of those who come to them for aid, that Christian Scientists only ask that they may freely resort to the healing method of their choice—a right which is constitutionally theirs, and that they have no desire to force or attempt to force the acceptance of their choice by others That the foregoing statements are true is substantiated by the fact that at least forty states of the United States, in their laws defining the practice of medicine and surgery, have embodied provisions, similar in import to Engrossed Senate Bill No 93, which protects the practice of Christian Science, thereby recognizing treatment by prayer as being distinct and apart from medical practice"

The New York medical practice act has the following reference to Christian Science

"This article (48 of the Medical Practice Act) shall not be construed to affect or prevent the following —or (8) the practice of religious tenets of any church"

The New York law does not permit a Christian Science practitioner to open an office for the practice of medicine, as the West Virginia practitioners seek to do

SCIENTIFIC PAPERS AT THE SOUTH CAROLINA STATE ASSOCIATION

The March *Journal* of the South Carolina Medical Association has the following editorial note on the plan followed by the Scientific Committee in making up the program of the State Meeting

"Since the publication of the notice to the effect that the Scientific Committee was ready to receive titles of papers to be read before the State Medical Association meeting, May 7, 8, and 9, some ten or twelve have been received The program will be limited to twenty papers with the major part of the meeting in Charleston devoted to clinics It is highly desirable that members intending to submit titles should do so at the earliest possible moment in order that the Scientific Committee may have ample time to plan the grouping of the papers and also to provide for discussion on them The latter feature has been a significant accomplishment of the meetings in

Any Artistic Workman Can Produce a Handsome Artificial Limb

But what about fitting the stump? What about the alignment of the artificial limb? What about durability? What about pressure at the sensitive points? Not to mention such important matters as the special care of the stumps of diabetic patients

The manufacture of artificial limbs is a science as well as an art Mastering it is the work of a lifetime The house of A A. MARKS, Inc, has given three generations to this work, and respectfully places its skill at the disposal of your patients

A. A. MARKS, Inc.
Crutches — Accessories
90 FIFTH AVENUE NEW YORK CITY

(*Continued from page* 420)

recent years The officers have seen to it that able men are invited to discuss papers and that they be provided with suitable abstracts long enough before-hand to insure careful deliberation as to what they are going to say Such a course adds tremendously to the solidarity of any scientific program and gives assurance to the membership that nothing has been left undone to make a complete well rounded meeting As time has gone on the Scientific Committee endeavored to bring about greater limitation of the volume of papers read but an increase of the discussions on the floor It is gratifying that so many members have approved of this plan In addition an enlarging scope of clinics has been in the minds of the officers of the Association to be very greatly amplified at the Charleston meeting"

The special feature of the plan is that abstracts of a paper shall be sent to those who are invited to discuss the paper, in order that the speakers may prepare their remarks Texas goes a step further, and requires that the reader of a paper before the State Society must first have presented it before a County or District Society (see this JOURNAL, June 1, 1928, page 705, and also the *Texas State Journal of Medicine* for April, 1928)

The February issue of *The Journal of the Medical Association of Georgia* also has an editorial on the scientific program and says

"Any member desiring to present a paper at the Macon meeting is hereby reminded that March 15th, 1929, will be the last day for receiving titles and abstracts of papers This year the committee will require of each applicant for a place on the program that he submit with title an abstract of paper, of not more than 50 words"

Fifty words are too little for a satisfactory abstract The limit had better be two hundred

DUES AND ENDOWMENTS OF THE WISCONSIN STATE MEDICAL SOCIETY

The Council of the State Medical Society of Wisconsin is considering raising the dues, and also of establishing an endowment fund The *Wisconsin Medical Journal* for February says

"1 Your committee finds that the employment of a lay-secretary-managing editor has of itself been an economy to the Society, that while we are today expending on the basis of a budget of $22,500, the additional monies used over 1922 when the dues were $4 a year are used for the direct service of the members

"Your committee finds that if the Society is to progress in its service to the members a larger income will be essential in the years to come, beginning with 1930, and it was moved by Dr Bird, seconded by Dr Gaenslen and

(*Continued on page* 423—*adv xix*)

(Continued from page 422—adv xviii)

adopted without dissent, that the committee recommend to the Council that dues of the Society be raised to $15 in 1930 Your committee calls attention to the fact that several societies have dues of this amount or larger, mentioning Minnesota, $15, Idaho, $40, Washington, $40, District of Columbia, $20, and Oregon, $20

"2 Your committee commends the Endowment and is proud of the present progress of the Endowment Fund Briefly it will be remembered that this is to consist of monies given to the Society by bequest and gift, the interest of which may be used by the Council to provide a service to the members that might not be secured by means of annual dues Your committee feels that it would be well to undertake active efforts to build this fund and commends the following procedure

"That the Society receive gifts from the members and pay thereon five per cent annual interest during the life of the member with the provision that upon the death of the member further interest payments will cease and the principal will revert to the Society endowment fund This guarantees the member a safe and fair rate of interest on the gift during the life of the member, and will, it is believed, go far towards building the separate fund Any difference between the safe rate of interest that can be secured on investments of such gifts, and the rate to be paid of five per cent should be met from the general budget of the Society Under no conditions is the principal to be used during the member's life Moved by Dr Sleyter, seconded by Dr Bird, and adopted without dissent.

"3 As result of this discussion, your committee presents the following suggestion as one made during the meeting but upon which no action was taken That to make some acknowledgment of outright gifts to the Endowment Fund amounting to $1,000 or more (upon which no interest is to be paid) the Society provide for and bestow the gift of life membership carrying with it all the perquisites of membership in the Society, without the requirement of dues, assuming that the member continues in good standing in his county medical society"

THE PHYSICIAN AS HEALTH OFFICER

While every physician performs some of the duties of a health officer, yet none has assumed that his acts of quarantine have had the force of law However, the Wyoming State Board of Health has passed a regulation which will be embarrassing to the practicing physicians of the state The law is discussed in the January issue of *Colorado Medicine* in the Wyoming department as follows

"The recent rule and regulations governing the

control of communicable diseases as passed by the State Board of Health, Oct 26, 1928, and given to the state by the State Health Officer under date of Nov 9, 1928, deserves our editorial attention

"The rule is as follows 'When a physician in the course of his practice has been called into a case of communicable disease, and has placed reasonable restrictive quarantine measures against said case and the household in which said quarantine case is situated, then said quarantine measure placed by him shall have the same force and effect as though the quarantine had been placed by the legally constituted health officer'

"We are willing to admit on the start that we believe the State Board of Health passed the above rule with the best of intentions, but the legal aspect is an entirely different question. It is not a question of good intentions

"In substance this rule attempts to place the responsibility of the quarantining upon the general doctor and relieves the health officer, either state or county, of the responsibility

"Such delegations of power cannot be legal as the State Board of Health is not vested with such authority It does have the power to appoint county health officers and deputies whose duties are outlined by the statutes, but it does not have the power to make all the doctors of the state agents with the authority to detain and quarantine the people of the state without the consent of the doctors

"The law makes it the duty of every doctor, teacher, hotel proprietor, and every citizen when he discovers a contagious disease to report the same to the City, County and State Health Departments and it becomes the duty of these departments of health to follow out the provision of the law and the reasonable regulations of the State Board of Health and to enforce these rules and laws

"The recent unconstitutional rule is simply side-stepping by the Board of Health of its own plain duty and the physicians of the state will not take kindly to such buck passing

"County and state health officers are paid for their services and should measure up to their responsibilities—and not try to pass the buck

"A question of such importance should have been submitted to the attorney general of the State of Wyoming for an opinion before such an order was ever issued by the Board of Health.

"To strengthen the laws should be the desire of the Board of Health rather than to pass a rule whose validity is in question Certainly the cooperation of all the members of the medical profession is most important and we as doctors desire that every move made by the State Board of Health be legal beyond question as we all know

(*Continued on page 425—adv xxi*)

(*Continued from page 424—adv xx*)

ow hard it is to get perfect cooperation by the people on questions of quarantine

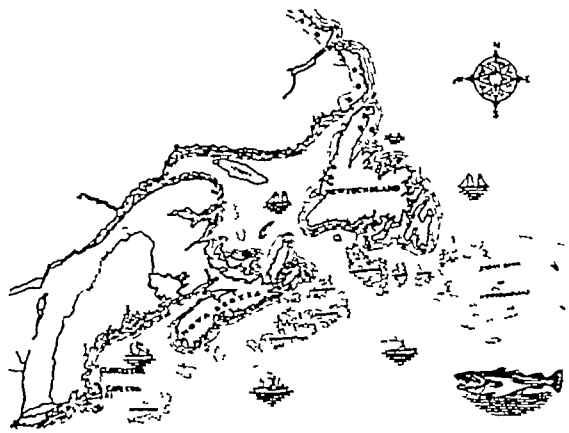
"Let the Board of Health get a ruling from the attorney general before putting out every change in our health rules, to be sure of its legality"

POPULAR MEDICAL EDUCATION IN YORK COUNTY, PA

Physicians everywhere are interested in the wide publicity of erroneous statements given to murder in York County, Pennsylvania, in which belief in witchcraft was the alleged motive The inference of course was that a considerable number of people formed a sect who practiced the rites of witchcraft. The Editor of the *Pennsylvania State Journal* requested a physician of York to write the circumstances of the murder from a medical point of view The description is contained in the March issue of the *Pennsylvania Medical Journal* as follows

"Recently, a young man regarded by the rank and file as a lunatic, who believed in powwowing, with two accomplices who he persuaded to the same faith, committed a murder which is very much deplored by the citizens of York and York County Because of this unfortunate incident the public press did not hesitate to bring contumely on the entire population

The "*Literary Digest* stated that 'prosecution is hampered by the fact that it is difficult to find a *sufficient number of men free from belief in* the sorcerer's art to constitute an impartial jury'



"The facts now are that the three murderers received *separate trials, and all* were convicted of murder, two in the first degree and one in the second degree—and this was accomplished in six days So long as the rank and file of York citizens mete out such swift justice to its criminals, it would seem that more good might be accomplished if the editors in question were to devote their attention to cleaning up the crime in their own communities

"If the intelligence and capacity of a people may be measured by the industries, institutions, bank balances, thrift and general prosperity, and the men of influence produced in what is known as the region of the Pennsylvania Dutch, then this objectional publicity is an ungrateful villification and aspersion of the fair name of York"

The Literary Digest in its issue of January 5, 1929, page 24, compares the people of York and neighboring counties with those of 'Medieval Ages' and the inhabitants of the 'Kongo'"

The letter then gives a list of articles manufactured in York including 75 per cent of the artificial teeth used in the world It also cites

The American Cod Liver Oil Map

THERE was a time, not so very long ago, when the fallacy existed that America could not produce good cod liver oil.

The Patch workers exploded that theory and helped to revive an old American industry This required a combination of research work and the development of new methods for making oil.

The results have been noteworthy An American Oil of the highest vitamin potency and—by improving the method of production—an oil of pleasant taste.

Along the shore line, from Cape Cod to Labrador, are the Patch plants—where the oil is obtained from the fresh livers Out on the Banks are the steam trawlers equipped with the Patch cooker, where the oil is made soon after the fish come out of the water

To increase resistance against disease and to build up energy after influenza and similar conditions—Patch's Flavored Cod Liver Oil, with its high Vitamin A content, is particularly valuable

You should taste this fine American product, so send for a sample, and with the sample we will send you the whole story of how Patch put America on the cod liver oil map

$2,500,000 voted for new schools during the last year and $200,000 for a new hospital The articles appearing in newspapers gave the impression that a belief in witchcraft was characteristic of the people The letter published in the *Pennsylvania Medical Journal* emphasized the high character of the people of York over a hundred years ago, said

"At the outbreak of the Revolution, it was York that sent the first company of volunteers to Boston It was Phineas Davis who built at York in 1832 the first locomotive that burned coal, for which he won a prize of $3,500 York was the home of Jeremiah S Black, Attorney General and later Secretary of State during President Buchanan's administration, who was himself a citizen of this section of the country York County was the early home of United States Senator James Ross, and more recently of Dr Edgar Fahs Smith Provost of the University of Pennsylvania, and his brother Dr Allen J Smith, pathologist of the same institution, both now deceased York was the home of the Continental Congress for nine months It was there that the Articles of Confederation were adopted Much interesting history was made during those nine months York was also the home of A. B Farquhar who died recently, and whose name is known in all the civilized countries of the world, through his manufactured farming implements"

The article concludes with the following paragraph

"This statement speaks for itself, and we are glad to give publicity to a correction which should be made in justice to the people attacked It is obvious that the medical profession may safely confine its efforts to the usual lines of public-health endeavor in York"

OBJECT OF STATE DUES

The March issue of the *Nebraska State Medical Journal* has an editorial discussion on the expenses of the State Society and says

"We are sometimes asked what becomes of the eight dollars we pay for dues Why is so much money needed? The answer is in the report of the councilor meeting published in this issue of the Journal It is the duty of every member to study this report and inform himself

"The Nebraska State Medical Association has become a small giant functioning in various activities for the good of the profession and the public welfare The council and the several standing committees are the pulsating, functioning parts of the organization from one annual meeting to another

"The delegates to the American Medical Association constitute a committee that keeps us in

(*Continued on page 427—adv xviii*)

(*Continued from page 426—adv xxii*)

ouch with the activities of this great organiza-
ion Read the delegates' report

"The public activities committee is function-
ng in a surprisingly active manner, by promoting
ealth education courses at the state normal
chools, at the state university, at the annual meet-
ng places of the Nebraska State Medical Asso-
iation and by health exhibits at the state fair
The report is well worth reading

"The program committee functions quietly and
effectively Last year's program was one of the
best ever presented

"The work of the campaign committee and also of the legislative committee are not matters often put into print, but the functioning of these committees is well known to those who keep in touch with association affairs

"The committee on medical defense is active throughout the year and handles several dozen alleged malpractice cases efficiently

"The financial report shows an annual budget well above nine thousand dollars, with over seventeen hundred dollars transferred to the Journal fund, over twenty-three hundred dollars to the defense fund and smaller sums to various committees and activities for the good of the profession The report also shows a balance on hand in the general fund represented by investments of ten thousand dollars The Journal fund has investments of over fifty-six hundred dollars, while the defense fund has investments of over eighteen hundred dollars This shows a prosperous condition and an ability to undertake and handle new problems

"Study the report carefully and be convinced your eight dollars is going to a good purpose and is being handled by your servants in an efficient manner"

The editors of the NEW YORK STATE JOURNAL OF MEDICINE wish to call attention to the form of the financial statement which begins on page 126 of the *Nebraska Journal* The total receipts for the *Journal* for the year 1928 were $5,684 66 The total direct disbursements are $6,905 70 The expense account is itemized, but is by the name of the creditor only The item 'Huse,' $4,089 82 is probably for printing, but the financial statement does not say so

NEW JERSEY LEGISLATION

The March issue of the *Journal* of the Medical Society of New Jersey has the following editorial summary of impending medical legislation

"In the last month's *Journal* we discussed the combined chiro-osteo-naturopathic bill. But, the osteopaths were, apparently, not satisfied, and within two weeks had submitted S 44—much the worst bill they ever put up in this state—claiming additional privileges and honors for themselves, they would fain practice 'obstetrics and minor surgery without restriction' (which sounds to us like major surgery) and be permitted full usage of the title 'doctor' and its abbreviation 'Dr' Nor are they now content with the definition of the word 'osteopathy' as determined by themselves in the existing law 'a method of healing whereby displaced structures of the body are replaced in such a manner by the hand or hands of the operator that the constituent elements of the diseased body may re-associate themselves,' is far too limited to cover their present aspirations It is well known that in different states, and at different times in some states, both the osteopaths and the chiropractors have offered widely variant definitions of their 'system of therapeutics,' but the new definition presented in S 44 ought to solve their difficulties for all time, as it is a masterpiece of verbiage, i e, 'the osteopathic system of therapeutics is that system of therapeutics taught in the legally incorporated schools and colleges of osteopathy or practiced in the clinics and hospitals in connection therewith' Nothing could be simpler, no statement could be more complete and tell less about the subject. And, there is nothing in the definition to argue about, 'I am what I am'

Well, the osteopaths having broken away from the tripartite bill, it was natural for the other sects to consider their own special interests, and at the next sitting of the House the naturopaths had A.145 introduced, in all probability the chiros will have submitted a bill of their very own before this JOURNAL is off the press

"You may ask why the medical profession should be required to make a fight of this sort, why the public does not look after its own protection? Well, we should not be required so to do, but we are The general public rarely knows anything about legislation until after it has become law, when it is too late to do anything about it As the time honored guardians of the public health it perforce becomes our duty to protect the public against such threatening legislation and against its own lack of interest in self-protection."

WORKMEN'S COMPENSATION IN IOWA

The March issue of the *Journal* of the Iowa te Medical Society contains some interesting ormation regarding workmen's compensation, it says

"House File No 111 by Cole undertakes to inge the Iowa Law in such a manner that the spitals and physicians of the state will receive more nearly fair compensation for services idered The present total that is paid for both spital and professional services is $200 When e necessary cost of a case exceeds that low limit, th physician and hospital must have their bills t"

The following states set no legal limit to the nount of a medical bill for injured workmen, ebraska, Minnesota, Wisconsin, Illinois, North akota, Indiana, Michigan, New York, Massausetts, New Hampshire, Connecticut, Virginia, klahoma, Texas, Washington, Idaho, Nevada, rizona and California

The following states have limits to medical ompensation, Missouri, Ohio, West Virginia, laryland, Montana, Utah, Wyoming, Oregon nd Louisiana

The article continues

"The maximum limit of $200 provided by our tatute in a very large proportion of cases In the rare exceptions, however, there is wont to be grievous misfortune to the workman and serious sacrifice to hospitals and physicians While the commissioner means always to be considerate and conservative in the matter of increasing the compensation burdens of industry, it is believed that justice demands an increase in the statutory allowance for physical relief to injured workmen

"Recommendation to this end is made after investigation showing that the change will only nominally increase the sum total of medical and hospital expenses to the employer or insurer While this statement will be challenged, it is subject to convincing demonstration These figures are submitted as the experience of six insurance companies leading in compensation coverage in Iowa, withholding names that appear herewith

No 1 Cases in which medical, surgical and hospital requirement exceed $200—1 4 per cent

No 2 Limit exceeded in 173 cases out of a total of 9,031 or 1.9 per cent

No 3 Twenty cases out of 1,600 or 1 2 per cent

No 4 Four cases out of 100 or 4 per cent

No 5 Nine cases out of 1,765 or 5 per cent

No 6 Very small percentage reached maximum

CALCIUM THERAPY

Calcium therapy has not been more widely applied because of the want of suitable preparations Even the best for oral use are objectionable on account of the taste All, when injected intramuscularly, cause pain, infiltration and, possibly, necrosis These drawbacks are all avoided by "Calcium-Sandoz" (Calgluconate) The powder is palatable, especially when administered in orange juice, and well absorbed The ampules can be injected intramuscularly without producing local irritation, which is not possible with any other calcium compound Intravenously "Calcium-Sandoz" causes less general reaction than the chloride, and accidental leakage of a few drops out of the vein is harmless See page xxiii *Adv*

AMERICAN COD LIVER OIL

There was a time, not so very long ago, when the fallacy existed that America could not produce good cod liver oil

The Patch workers exploded that theory and helped to revive an old American industry This required a combination of research work and the development of new methods for making oil

Along the shore line, from Cape Cod to Labrador, are the Patch plants—where the oil is obtained from the fresh livers Out on the Banks are the stream trawlers equipped with the Patch cooker, where the oil is made soon after the fish come out of the water

To increase resistance against disease and to build up energy after influenza and similar conditions—Patch's Flavored Cod Liver Oil, with its high Vitamin A content, is particularly valuable.

You should taste this fine American product, so send for a sample, and with the sample we will send you the whole story of how Patch put America on the cod liver oil map See page xxi *Adv*

A CAN OF MILK

Seventy years ago, Gail Borden offered to the medical profession of his day a can of milk. "This, gentlemen," we can imagine his saying, when representatives from the New York Academy of Medicine officially inspected his laboratory in 1857, "this, gentlemen, is condensed milk. Fresh, pure, full-cream milk, from which most of the water has been removed and to which refined cane sugar has been added. I offer it to you, gentlemen, as a practical aid in one of your most vexing problems—the problem of securing a safe milk supply under all conditions of climate and travel"

Gail Borden's can of milk was destined to revolutionize the milk industry of the world And it was destined to play a part in the evolution of a science then in its infancy—the science of infant feeding

For Gail Borden's milk "agreed" with babies This was obvious from the very first—though it remained for the research workers of a later generation to fully explain why Gail Borden had "builded better than he knew"! The cane sugar content of his milk—added in proportions that would assure "keeping"—was found also to assure the average infant a satisfactory supply of carbohydrates And the method by which the milk was condensed—prolonged cooking in vacuo—not only destroyed harmful bacteria but overcame effectually the difficulty of casein digestion which had caused such great trouble among artificially fed babies. Changes in milk structure produced by this method made condensed milk as easy to digest as breast milk.

This marvelous assimilability led, naturally, to wide use of the food It would be impossible to estimate how many millions of babies, generation after generation, have been fed on Eagle Brand Condensed Milk See page viii. *Adv*

OHIO SPECIAL AND A M A MEETING

The Ohio State Medical Association, like the Medical Society of the State of New York, is promoting a special train for the American Medical Association meeting in Portland Oregon, which will be held during the week beginning July eighth The March issue of the *Ohio State Medical Journal* says

"Ohio's special train to the annual meeting of the American Medical Association at Portland, Oregon, July 8 to 12, will leave Chicago at 11 50 p.m , Thursday, June 27

"Plans for this all-expense round-trip tour with stop-overs to and from the Portland meeting were announced in the February issue of the JOURNAL and since then a 16-page folder giving the complete details about the trip has been mailed to members of the Ohio State Medical Association

"This folder not only describes at length the attractive and interesting itinerary arranged for the Ohio party to and from the A M A meeting but also tabulates the cost of the tour privileges and gives other general information concerning the trip

"Quite a number of Ohioans already have signified their intention of making the trip by notifying the Executive Officers, 131 East State Street, Columbus, Ohio Those who are planning to be aboard the special train and have not as yet made reservations are urged to do so promptly to insure themselves of accommodations included in the all-expense trip

"Those in charge of arrangements for the Ohio party have obtained options on hotel rooms at Yellowstone National Park where the Buckeye special will stop for five days, at other over-night stops and at Portland"

Poland Water

is not only a benign diuretic, but its Amylolytic properties make it helpful in cases of amylaceous dyspepsia

SURGICAL MANAGEMENT OF TUBERCULOSIS OF THE KIDNEY*

By OSWALD SWINNEY LOWSLEY, M D, F.A.C S, and THOMAS CLEMENT HILL, M D, NEW YORK, N Y

From the Department of Urology (James Buchanan Brady Foundation) of the New York Hospital.

TUBERCULOSIS of the kidney occurs with sufficient frequency to give it a prominent position among the diseases which afflict mankind It therefore assumes great importance in the field of Urological Surgery

Of late years there has been a considerable change in attitude regarding our procedures concerning tuberculosis of the kidney It has been and indeed now is the practice in some clinics to remove a kidney which consistently shows the presence of Tubercle bacilli in the urine drained from it regardless of the function of the organ It is our practice, however, to only remove such a kidney when the function is greatly diminished provided the other side is competent to maintain life whether or not it also shows the presence of tubercle bacilli

This paper is based on a study of sixty-three (63) cases upon whom nephrectomy was done for tuberculosis of the kidney in the New York Hospital, occurring between December, 1914, and January, 1928

Diagnosis

Some idea of the occurrence of renal tuberculosis may be gained from the report of Shapira et al, who, ten years ago, reported a study of 600 cases of pulmonary tuberculosis among whom there were 63 cases presenting symptoms of urinary infection, 23 of whom showed demonstrable lesions in the urinary bladder

Kapsammer in a careful study of 20,777 routine autopsies found 191 cases of renal tuberculosis or a little more than one per cent of all cases Sixty-seven (67) of these were unilateral and 124 bilateral. Kusters, on the other hand, as reported by McCown, found 158 cases among 5,338 routine autopsies or about three per cent. Necropsies on tuberculous bodies show the presence of tuberculosis of the urinary tract in from 18 per cent to 33 per cent of the cases according to the findings of different investigators

Caulk found that tuberculosis of the kidney occurred in 30 per cent of all surgical lesions of the kidney studied in his series

Medlar of Wisconsin has made a very important study of thirty cases of pulmonary tuberculosis, none of whom gave clinical symptoms of renal tuberculosis All these cases showed caseation of the lungs and 100,000 sections of the kidney were made Every case showed evidence of renal tuberculosis Cortical lesions numbered 75 per cent, medullary 11 per cent and cortical medullary 14 per cent. That the infection is hematogenous is evidenced by the preponderance of cortical lesions True, tuberculous lesions only were studied Only two cases of the thirty failed to show scars In twenty-two cases definite lesions were found and of these fourteen showed scars Tubercle bacilli may not be found in the urine in each case because the lesion may be well walled off Medlar also states that both kidneys were examined in fourteen cases Two were negative and one case showed scars in both kidneys The remaining eleven had tuberculous lesions in both kidneys If the findings in this study represent the true facts it is apparent that every case of pulmonary tuberculosis is a potential candidate for renal infection and it would also seem that cases of renal tuberculosis are secondary to some other tubercular foci, usually pulmonary and that the infection is hematogenous in origin Healing of a cavitated kidney probably does not occur, but we are led to believe that under suitable

hours This posture often brings out kinks of the ureter and malpositions of the kidney which would never be suspected if one judged conditions solely by pictures taken while the patient is in the prone position

Diagnosis

The diagnosis of tuberculosis of the kidney in former years was made almost entirely upon the basis of the discovery of tubercle bacilli in the urine either by microscopy or guinea pig inoculation

In this series thirty-three (33) guinea pigs were inoculated Of these, 25 were positive for tuberculosis and eight were negative The kidneys of these eight cases, however, were removed and showed lesions of tuberculosis, the diagnosis having been made on the diminuation of function on the effected side and the appearance of the pyelogram It is now our custom to remove a kidney as tuberculosis which shows the characteristic lesion as portrayed by pyelography and which shows a marked diminution in function, upon more than one occasion, as regards the secretion of urea and the excretion of phenolsulphonephthalein The removal of a kidney precludes that the remaining organ has sufficient functionating ability to maintain life If both kidneys are determined to be tuberculous one may be removed provided it is almost or quite functionless and provided the remaining one is only slightly affected The mere finding of tubercle bacilli in the urine from a kidney is not sufficient evidence to cause its removal unless the function is considerably disturbed It has been definitely proven that tubercle bacilli may pass through kidneys which have no apparent lesions of the disease In this connection we submit the following case in which a kidney was removed because of the presence of tubercle bacilli in the urine secreted by it. Upon removal, a careful examination by our pathologist failed to reveal any evidence of the disease

Resumé of Case 1

Admitted October 14, 1926

Chief Complaint Pain in left kidney region, duration four months

Family History Irrelevant

Past Personal History Lost left eye in childhood from some unknown cause Had scarlet fever and diphtheria No history of past urological diseases

Present Illness Began to develop pain in left kidney region four months ago which was referred down the left ureter, was dull aching in character There were times when it would disappear, but the intervals between recurrence became shorter and pain grew worse—later being associated with a mild frequency and an occasional mild hematuria Lost 40 pounds in one-half year Positive diagnosis had been made and patient was admitted for observation before operating

Physical Examination Revealed an anemic young woman with a left kidney which was slightly enlarged and low, on palpation

Cystoscopic Examination Showed a slight elevation of the trigonal region at the vesical orifice, otherwise the vesical wall showed no change Ureteral specimens showed (right) urea—10 gms per L—(left) urea—11 grms per L The Phenol-Sulphone-Phthalein report* (Right), appeared in seven minutes, (left), appeared in ten minutes Total amount secreted ten minutes after appearance time (right) eight per cent—(left) six per cent. All cultures of urine from the ureters and bladder were sterile

X-ray Report Both kidneys shadows are normal in size and position Pyelogram (left) —shaggy calices, both upper and lower Stricture at the uretero-pelvic junction

Guinea pigs were inoculated with the specimens from both ureters The report showed the right to be negative—the left showed a greatly enlarged spleen and liver, with many tubercles A diagnosis of tuberculosis of left kidney was made—nephrectomy was done in the usual manner on October 15, 1926, left kidney being removed Patient was discharged on the 11th day after operation with the wound closed except for a small sinus where the drain was placed She was advised to return to the Post-operative Renal Tuberculosis Clinic In the meantime her pathological report showed a diagnosis of *"Chronic Pyelitis"* and *Fibroma* of the kidney with no evidence of tuberculosis seen

Post-operative Treatment Patient returned two weeks after discharge from hospital Her treatment has consisted of injections of old tuberculin — Alpine Light Therapy Advice as to diet and general living conditions—periodic cystoscopic examinations of her bladder—she has been also allowed to go to summer camps for a few weeks at a time in order to build up her general physique Although this patient has not been very co-operative and sincere in her treatments, she has gained 11 pounds and is free from symptoms and going about her natural life

The accompanying pyelograms demonstrate some of the characteristics known to be caused by tuberculosis of the kidney This disease is characterized in two ways Rapidly developing tuberculosis in the upper urinary tract results in dilatation of the kidney pelvis and excavation of the cortex and in dilatation of the ureter as well The ureter dilated from this cause very seldom, if ever, has tubercles in its wall It is, therefore, unnecessary to remove the entire ureter on the affected side (see Figs 1, 2 and 3)

circumstances such lesions may be clinically arrested Tuberculous lesions of the lungs, intestines, etc, do heal and so with the above evidence of tuberculous scars of the kidney it would seem that tuberculosis of the kidney does heal It is also very evident from Medlar's study that the absence of the tubercle bacillus in the urine does not rule out tuberculosis of the kidney Tuberculosis of the kidney may be hematogenous in origin and is bilateral if we are to accept the facts related in this study

A review of the histories of patients suffering from tuberculosis of the urinary tract will reveal that the omnipresent symptom is frequency of urination

It is universally present and may or may not be accompanied by dysuria There is usually pus present in the centrifugalized urine and often blood

If the disease is of any considerable duration there is loss of weight as a rule, but this is not always the case Sometimes the patients are well fed and occasionally even fat

The urinary symptoms are usually accompanied by much nervousness and irritability This is caused partially by absorption of toxines produced by the diseased areas and partially by loss of sleep and rest due to the almost constant urination to which these cases are subjected After a complete history is taken, the examination proceeds

The examination consists of two parts First, a general physical examination This is complete in every detail and in addition to the ordinary inspection, palpation, percussion, and auscultation where indicated, the patient's blood pressure should determined and the examiner should familiarize himself with the microscopic appearance of the blood and the blood chemistry as well

After the general examination a special investigation of the urinary tract is undertaken A sample of a twenty-four-hour specimen of urine is thoroughly tested in every way

Cystoscopy is then undertaken If the patient's symptoms are mild this is accomplished by the use of intravesical and intraurethral instillation of novocain-borate or some similar substance If, however, the symptoms are more intense it is proper to administer sacral block It has been noted formerly by us that ether anesthesia in the cases of tuberculosis of the urinary tract results in great improvement in symptoms which may persist for some time No adequate explanation of this desirable result has ever been made It is our impression that the distention of the bladder accomplished under general anesthesia is responsible for the improvement of symptoms

The reason why sacral anesthesia is preferable to ether for purposes of examination is that under the latter the necessary X-rays are difficult to get due to the inability of the patient to cooperate by cessation of respiration at the right time

After the passage of the instrument and proper irrigation of the bladder the entire fundus is carefully observed and the presence of ulcerations, tumors, stone, diverticula and other abnormalities are noticed The ureteral orifices are examined and deviations from the normal in size, position and appearance are recorded The remainder of the trigonum vesicae is then examined and finally the vesical orifice is examined throughout its entire circumference so that any abnormalities present may be noted

The entire bladder having been examined, catheters are then inserted into the ureters and passed to the kidney pelves Specimens are collected from each side and the following examinations are made for purposes of comparison

(1) Culture
(2) Guinea pig inoculation
(3) Urea estimation
(4) Microscopic examination of the centrifugalized wet specimen to determine the presence of pus, blood, epithelial cells, detritus and microorganisms

It is a most interesting fact that the urine of a person having tuberculosis of the upper urinary tract rarely, if ever, contains any other microorganism, therefore, if a patient has much pus in the urine and the ordinary culture is negative one must be suspicious of tuberculosis

An additional functional test is then made for comparison of the two sides This is accomplished best by the use of phenolsulphonephthalein injected intravenously because this method provides a rapid excretion of the drug, thereby shortening an uncomfortable procedure One c c of the drug injected intravenously appears within five minutes in the urine if the kidney is normal and within ten minutes after appearance time a sufficient amount of the dye is excreted to allow a proper comparison

Plain X-rays are then taken of kidneys, ureters and bladder Following this a pyelogram is done on the affected side This is accomplished by injecting sufficient sodium iodide 20 per cent just to fill the kidney pelvis The pyelogram is taken just at the moment of filling The next picture is taken with the catheter withdrawn to the lower end of the ureter and the patient elevated to a sitting posture The ureter is distended and picture taken just as it is filled The sitting posture reproduces the condition of the kidney and ureter which exists during the patient's waking

from tuberculosis of the kidney also are afflicted with pulmonary tuberculosis and also due to the fact that all such persons are in a run down condition, it seems most desirable to avoid the use of general anesthetic for purposes of operation whenever possible Therefore, it has been our custom to perform all nephrectomies under regional anesthesia The method employed is a modification of the excellent procedure practiced by Prof Von Illyes of Budapest and which was described by one of us several years ago

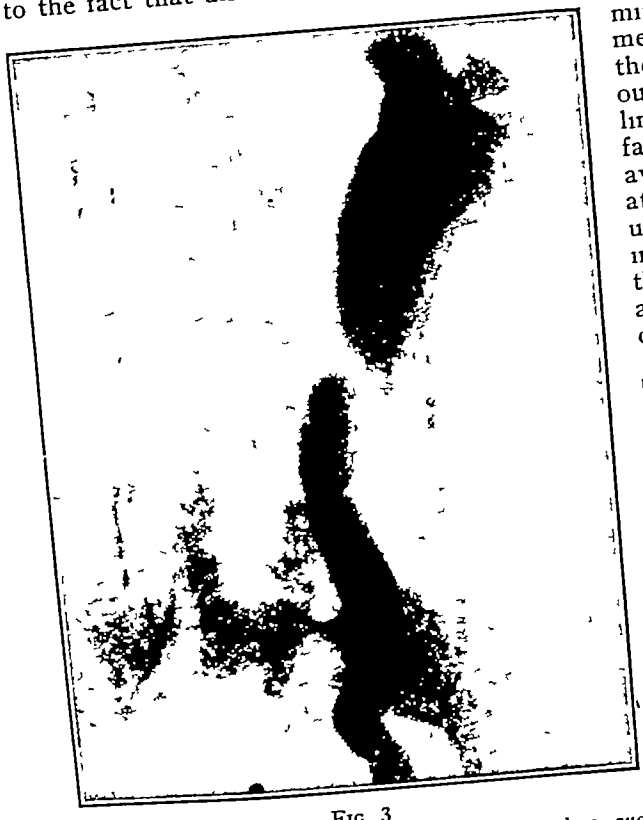

FIG 3

There is a massive dilatation of the calyces, pelvis, and entire ureter such as is frequently found in rapidly developing tuberculosis of the upper urinary tract Such ureters rarely have tubercles in their walls and it is perfectly safe for the surgeon to leave the stump

Preoperative Preparation

It is our custom to limit purgation to a period at least 24 hours before operation It is considered that purgation is necessary, but if it is done immediately before operation usually results in a sleepless night and considerable dehydration so that instead of feeling fit for anything the patient is weakened and depressed Alkaline solutions are administered by mouth or rectum during the period immediately preceding operation Fortunately, when a patient is operated upon by means of regional anesthesia, he may take fluids up to, during, and immediately after operation, a most important consideration in diseases of the urinary organs

It was formerly a routine procedure to administer morphine in divided doses after the method recommended by Gwathmey Due to the experience and researches of members of our staff we have become convinced that preliminary narcosis is entirely unnecessary In fact we feel that by eliminating morphine we avoid nausea and vomiting at the time of operation, ileus, constipation and suppression of urination after operation Furthermore, it is impossible to see any advantage obtained by the use of morphine in the effectiveness of the anesthesia If the patient is nervous and excited a whiff of ether or aromatic spirits of ammonia seems to be a much more effective method of quieting him than any amount of preliminary narcosis

FIG 4

The shagginess shown in the calyces of this pyelogram is caused by tuberculous granulations There is encroachment into the lumen of the ureter just below the transverse process of the fourth lumbar vertebra This is also caused by tuberculous granulations It is important for this ureter to be removed to a point below this filling defect

Solution Used and Methods of Administration

Up to the present time we have found no solution more satisfactory for general use than

In the chronic long standing type of renal tuberculosis there is an attempt on the part of nature to heal the lesion This manifests itself by the ingrowth of granulations into the excavated areas in the cortex, pelvis and the ureter These tuberculous granulations give to all the areas affected a feathery appearance in the pyelogram or ureterogram which is quite characteristic (see Figs 4, 5, 6 and 7) When one sees a ureterogram with this feathery appearance he knows that he must remove the entire ureter because the tuberculous granulations causing this appearance have become foci of infection and unless removed will continue to produce tuberculous pus and pour it in a concentrated form into the bladder thus perpetuating the symptoms If it is not deemed advisable to remove the entire ureter at any time of nephrectomy due to the condition of the patient the surgeon must plan to remove it at a later date when the condition of the patient warrants such intervention

FIG 1

This pyeloureterogram shows dilatation of the middle and upper calyces and shagginess of the lower calyx The entire ureter is dilated indicating the rapidly developing type of tuberculosis Experience has taught us that these ureters rarely have tubercles in their walls

Several authors, Albarran among these, have insisted that at the first beginning of upper urinary tuberculosis it is always unilateral and becomes bilateral quite late in the disease. Whether or not this theory is correct it is certain that usually one kidney is much more seriously affected when the disease is bilateral The remarkable improvement in the general health of the patient as manifested by gain in weight, strength, and well-being after the removal of an almost functionless tuberculous kidney even when the other one is known to be slightly affected, leads us to believe that if given the proper kind of care patients may heal tuberculosis of the kidney just as they do tuberculosis of the lungs or other organs Indeed, at autopsy and occasionally at operation healed and calcified tuberculous abscesses of the kidney are not infrequently seen

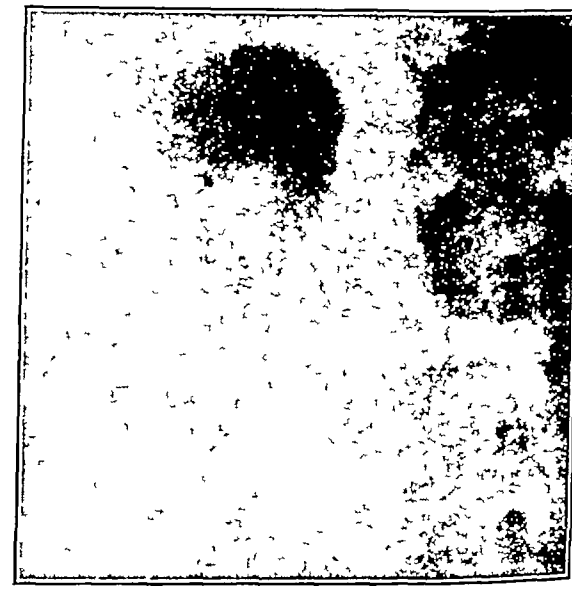

FIG 2

The feathery edges of all the calyces indicate the presence of tuberculous granulations The dilatation of the ureter shows no encroachment of granulation tissue There is a kink of the ureter just above the transverse process of the fifth lumbar vertebra

Operation

A diagnosis having been reached and nephrectomy decided upon, it is usually desirable to operate at once Ordinarily, the sooner the badly diseased organ is removed the more promptly will be the recovery and, therefore, immediate operation is desirable Occasionally, however, a patient may be so run down by the severity of the symptoms that a preliminary course of preparation is advisable.

Anesthesia

Due to the fact that some persons suffering

injections taking their origin from the original wheal The patient is then placed on the opposite side in a comfortable lying position Injections are made into the skin, subcutaneous and muscular tissues of the entire loin with one-half per cent procain All of these injections take their origin in the preliminary wheal so that the only pain the patient feels is one needle prick at the beginning of the infiltration

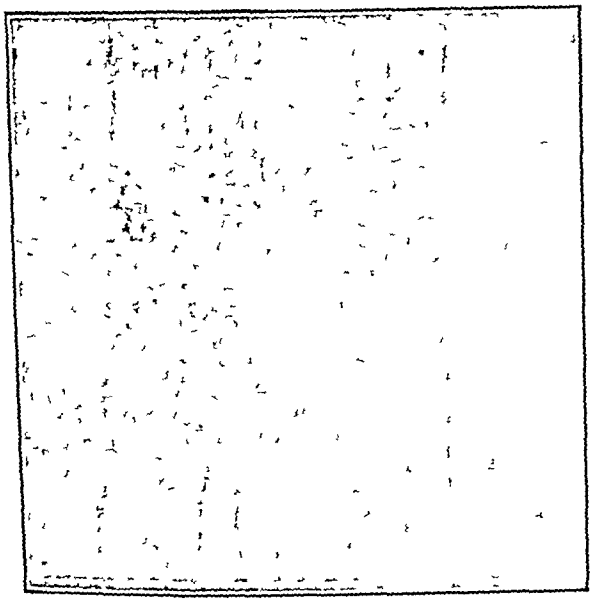

FIG 7

The extreme grade of featheriness depicted in this pyeloureterogram indicates that the disease has been of very long standing The filling defects are caused by ingrowth of tuberculous granulations and is Nature's method of attempting to heal the lesion The entire ureter must be removed in such a case in order to prevent the pouring of tuberculous pus into the bladder and thus causing a persistence of the symptoms

It is very important to avoid pain in the administration of the anesthesia because the average patient will be much more cooperative if this is successfully given It is hard to convince the patient that no pain will result from a cutting operation if the administration of the procain is particularly uncomfortable It has been our custom not to give more than 150 c c of one per cent procain (1 5 gm) or its equivalent to the average sized man

It has always been possible for us to proceed as soon after the completion of the injection as it was possible to get the patient in position and properly prepared and draped

When the needle approaches the intervertebral foramen care must be used not to exercise too much pressure as it is at this point that toxic symptoms with absorption of the drug may occur Neither is it a necessity to have the fluid penetrate the foramen of each of the nerves as pressure at the sill of the foramen seems sufficient to produce the desired anesthesia Raising and lowering the needle alternately at the sill of the intervertebral foramen assures a better distribution of the anesthetic and is important In the vicinity of the 12th nerve, lying as it does below the rib and having a tendency to spread, should receive a *little more anesthesia than the nerves above*

The successful carrying out of this technic should give us a complete anesthesia of the posterior, lateral, and enough of the anterior abdominal wall to allow any of the modern kidney incisions to be made It is rarely possible to obtain a peritoneal and abdomen anesthesia as well The method described above has been *still further modified by our associate*, Dr Roy B Henline, who injects a few cubic centimeters of procain into the splanchnic ganglion thus producing much more efficient anesthesia

It may be well to repeat that the anesthetized areas should be tested out before we start on an operation It is also advisable not to ask the patient if he feels pain If it is present he will promptly communicate the fact to you If he is asked regarding sensation he is prone to become hypersensitive An eminently wise precaution that should not be overlooked is the screening off of the field of operation from the patient's view The presence of a physician or a well trained nurse to keep the patient's *mind diverted from the operative field* is a valuable asset in this technic as in other local or regional procedures

The method which we have described seems to have several advantages over the older ones In fat or heavily muscled individuals it is extremely difficult to locate the rib at the point usually recommended on account of the fact that there is a tremendous amount of tissue between it and the skin By the method described above, however, it is always possible to locate the angle formed by the transverse process and the lamella of the vertebra and that allows the injection to be made in the proper place in all the cases

It is considered particularly important to conduct the entire injection with only one prick of the needle The patient immediately feels that he will be carried through without pain and the fact that the injection is practically painless serves as a tremendous physchological boost

Operation

Experience teaches us that careful sharp dissection will not cause discomfort while any rough treatment is liable to be accompanied by pain Therefore the scalpel is used freely in separating muscle bundles even The incision is made larger than ordinary in order

procain It is well to consider 1 gramme to be the maximum dose of procain for each 100 pounds body weight of the patient Frequently much less than this amount is used A solution of one per cent is ordinarily quite satisfactory This is sometimes diluted to one-half per cent and occasionally two per cent may be utilized It has lately been discovered that many times the little dose of procain may be injected provided it is done very slowly

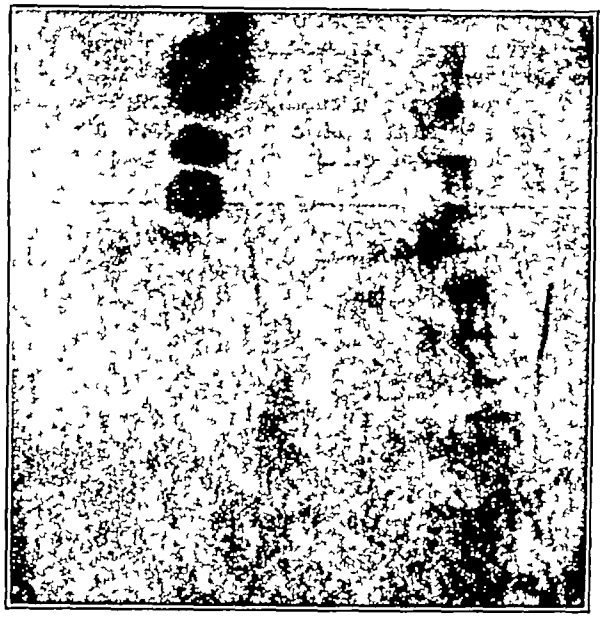

FIG 5

This pyeloureterogram shows excavation of the right kidney pelvis and shagginess of the lower calyx There is a stricture of the upper fifth of the ureter which is also due to tuberculosis of long standing

This solution is freshly made and sterilized by boiling about one hour before use

The addition of adrenalin or other drugs to the procain solution is strictly contra-indicated, the former because it adds decidedly to toxicity of the drug and the latter because they are ineffective

Upon arrival the patient is taken directly to the anesthetic room and a special nurse assigned to be present until the surgeon is ready to proceed All evidence of haste, flurry or active preparation are shut out

When all is ready for the administration of the anesthesia the patient sits on the table with feet on a support The hands rest on the knees or on the shoulders of an attendant who sits in front of the patient The back is bent slightly forward and the head lowered This position throws the bony parts concerned into most prominence and is maintained while the first part of the anesthesia is given It also can be administered with the patient lying on the opposite side

Starting at a point a little below the 12th costo-vertebral angle and about 2 cm from the midline a long wheal is raised by the injection of one per cent procain This infiltration extends from the original point to the level of the eighth rib A point opposite the spine of the seventh dorsal vertebra and two cm from the midline is selected A carefully tested needle is then inserted until it strikes the angle formed by the lamella on that side and the transverse process, it is then pushed over the edge of the bone and the point deflected inward and the needle being again inserted for

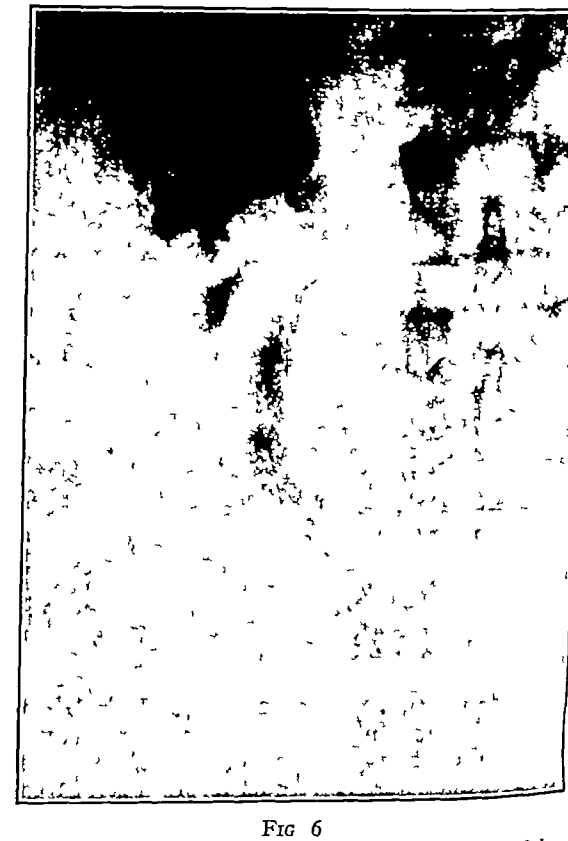

FIG 6

The shagginess of the lower calyx and the nodular appearance of the entire ureter indicate the chronic nature of the infection The entire ureter of this type of case must be removed If a stump is left the tubercles in the ureteral wall will continue to pour pus into the bladder and cause a continuance of the vesical symptoms

a distance of about one cm This brings the point of the needle into the area occupied by the emerging nerve roots Suction is put upon the syringe to make sure that the point of the needle is not in a blood vessel and then two or three c c of one per cent procain solution is injected into the region This is repeated at the 9th, 10th, 11th and 12th dorsal vertebrae Injection is made into the region of the pedicle. The angle formed by the 12th rib and the vertebral column is filled quite thoroughly both superficially and deeply with the solution, all

The higher instance among males is not in keeping with the findings of some other writers Cabot and Crabtree found females affected in 36 of 70 cases Israel's statistics show that of 43 cases, 29 occurred in women and he quotes Fachlanis' statistics which show that there were 73 among women to 30 in men. These figures added show that of 339 cases, 191, or fifty-six per cent were in women Braasch's findings, however, coincide with ours in that he found the incidence occurred oftener in men, e g, sixty-three and five-tenths per cent

TABLE B—*Ages of 63 Cases Undergoing Operation*

Number Cases	Years Old	Per Cent
7	11 to 20	11%
22	21 to 30	35%
22	31 to 40	35%
7	41 to 50	11%
5	51 to 60	8%
Youngest	12 years	
Oldest	60 years	
Average	31 6 years	

Seventy per cent were between 21 and 40
Patients with Post-operative data, 47

TABLE C—*Statistics of Cases with Postoperative Data*

Number Cases	Years Old	Reported Dead
6	11 to 20	2 or (33 2%)
13	21 to 30	3 or (23 2%)
19	31 to 40	2 or (11%)
6	41 to 50	0
3	51 to 60	0

The greatest incidence of the operative tuberculous kidney (70%) occurred between 20 and 40 years of age, the incidence being equal (35%) between 20 and 30, and 30 and 40 We did not have a single case in the first or seventh decades which is the usual finding of most writers Renal tuberculosis, when it does occur in children, is usually in conjunction with tuberculosis disseminated in other tissues so that operation is inadvisable We find that the general mortality average remains fairly constant in the various decades

TABLE D—*Statistics from Other Sources*

Other Statistics	Youngest	Oldest	Average Age	Incidence 21-40
Cabot and Crabtree	14	65	34-39	58%
Israel	8	63	32	66%
Braasch	10	61	‡	69%

‡Not stated.

We find here the average incidence between the third and fourth decade 65 per cent, as compared with our 70 per cent. The youngest patient we had was 12 years, the oldest 60 years, and the average was 31 plus, all of which are in close proportion to those reported by other writers The greater percentage during the third and fourth decades is interesting from a diagnostic viewpoint since tumor of the kidney occurs oftener during the first and after the fourth decades

Anesthesia

The introduction of regional anesthesia is one of the greatest steps forward in the progress of surgery on the genito urinary organs, due to the fact that nearly every disease of the genito urinary system is accompanied by a certain amount of renal deficiency This type of anesthesia is especially applicable to surgery of the tuberculous kidney, eliminating the elevation of the blood pressure and preventing the pulmonary complications which are so likely to occur in this type of patient, many of whom suffer from pulmonary tuberculosis Many of the cases of this series were operated upon under peravertebral anesthesia and we will give here a comparison of the results under the various methods with special emphasis on post-operative hospitalization (see Table E)

The average post-operative stay in the hospital for all cases was 24 0 days This includes operation under all types of anesthesia used, i e, ether, ethylene, gas oxygen, para vertebral, and para vertebral block with inhalation narcosis, by which we mean those cases of para vertebral anesthesia which were not entirely successful and were reinforced by ether The amount of ether used varies from half a dram to complete narcosis The para vetebral method was adopted at the Brady Urological Department (New York Hospital) in 1923 and 31 of the cases of this series were operated upon under this method We find that in 13 of these cases the anesthesia was entirely successful, causing little or no complaint from the patient and requiring no reinforcement with ether The average post-operative stay in the hospital was 20 5 days as compared with 24 0 days for all types of anesthesia used and 29 2 days for inhalation anesthesia alone

It is interesting to note that those operations done under para-vertebral block which were not successful and required ether reinforcement gave the patient an average of 22 days post-operative stay or 6 6 days less than the inhalation method There is no great significance to be inferred from the end results of anesthesia as indicated in this table, but we do know from past experience that shock is almost completely eliminated by para-vertebral anesthesia and also that post-operative pneumonia rarely occurs as compared to its frequency in inhalation narcosis (See Table E)

The influence of age appears to be a factor

to render heavy retraction by assistants unnecessary Satisfactory retraction is entirely possible, but sudden movements of any sort are liable to cause complaint

The incision is invariably a painless procedure The separation of the kidney from its surrounding adhesions, however, requires special treatment We have learned that if one avoids any manipulation upon the front or peritoneal surface until the remainder of the organ has been freed there will be less pain connected with this part of the operation (see Figs 8 and 9)

The ureter is usually isolated without much difficulty or pain Most writers on the subject lay great stress upon the amount of pain caused by clamping the pedicle It is our experience that this act seldom results in pain Should pain follow it is easily controlled by injecting some solution into the tissues forming the pedicle

FIG 8

This series of drawings shows the steps in exposing a kidney (a) Shows the skin incision commonly used by the authors (b) The latissimus dorsi and external oblique muscles are encountered (c) The latissimus dorsi is incised (d) The external and internal oblique muscles are incised (e) The fascia lumbo-dorsalis is then opened (f) The costo-vertebral ligament is exposed and incised as in (g)

The histories of 63 patients treated in the New York Hospital were employed in the estimation of most of the statistics which we will describe and only includes the cases which have come up for operation Statistics bearing on post-operative results were based on post-operative records of patients, secured either by personal examination or by correspondence This number includes forty-seven patients (seventy-five per cent) of those operated upon It will be noted that the entire series consists of patients operated upon between December, 1914, and January 4th, 1928, most of whose post-operative history is less than two years old This in itself is important as we know that post-operative mortality is greatest during the early period and that symptoms decrease each year

FIG 9

This series of drawings depicts the various steps in the removal of a kidney (a) The kidney is partially separated from the surrounding tissue and the ureter dissected free (b) The dissection is continued exposing the pedicle and tying off adhesions or abberant vessels (c) The ureter is clamped and double tied, cut ends being cauterized with carbolic acid and alcohol applied (d) The clamp is then applied to the pedicle (e) The pedicle is tied below the clamp, which is released at the time the knot is pulled taut so that the ribbon-like mass becomes tubular as the pressure is exerted (f) A Transfixation stitch is then inserted (g) The kidney pedicle is then cut and the wound closed in layers

TABLE A—*Sex of 63 Cases Undergoing Operation*

able of recognizing blood in the urine is to be questioned Thirty-eight or (95 %) reported a gain in weight, two patients gaining 25 and 35 pounds respectively It is interesting that such a large percentage of these cases gain weight immediately after the operation showing that an improvement in the general health has taken place Twenty-nine patients reported that they were in good health, many of them were able to return to their usual work. Nineteen or (47 5%) of the series reported that they were free from symptoms This is significant, for we find that thirty-five or (88%) were operated upon less than four years ago It is a recognized fact that the symptoms diminish in proportion to the time elapsing since operation In our series there are five patients who were operated upon six years ago or more and all are free from symptoms One patient died ten years after operation We have already stated that approximately 85% of the cases operated upon will satisfactorily recover

It was formerly our custom to feel quite satisfied with ourselves after successfully removing a tuberculous kidney especially if the patient gained weight after the operation The patient was discharged with the usual advice that a few weeks vacation be taken and the incident closed until the patient returned with recurrent symptoms and occasionally with the other kidney seriously affected

The occurrence of this type of case and the presence in our clinic of several cases in whom there was severe bilateral tuberculosis stimulated us to establish a special clinic for the care of patients having inoperable and post operative tuberculosis of the kidney as well as for the care of the occasional case of unilateral renal tuberculosis which refuses operation

In other words our attitude towards tuberculosis of the urinary tract has completely changed We never call a case of urinary tuberculosis "cured," but we consider a case which shows no symptoms following operation as being "arrested," and entitled to consistent long standing observation We also feel that almost no cases of urinary tuberculosis are hopeless By careful attention to diet, general

TABLE E—*Anesthetic Used*

?Not done.

in mortality The average in this group is 28 years, which comes within the limits of greater incidence (20 to 40), therefore, we would expect more deaths at this age It is easy to see that the mortality is in ratio with the severity of complications and duration of preoperative symptoms, depending upon the virulence and the length of time the patient has harbored the disease

Every case in Table F had a positive pathological diagnosis and every guinea pig inoculation which was done, also was positive This indicates that the disease was strongly virulent and had progressed enough to cause considerable destruction of the kidney tissue Each case had a severe complication with the exception of one, only complications of major significance being listed as we would expect every case of renal tuberculosis to have complications of some nature

Patients operated upon for unilateral renal tuberculosis, 63 Operative mortality, 2, or 3 2 per cent of total number of cases

Number of patients with complete post-operative data, 47 Number of deaths occurring after recovery from operation, 7, or 14 7 per cent of total number of cases

Number of deaths occurring one year or less after operation, 4, or 57.2 per cent of cases which died, two years after operation, 2, or 28 4 per cent, ten years after operation, 1, or 14 4 per cent

The operative mortality (3 2 per cent) is not significant in that both cases died of complications in no way related to the operation The total mortality is 14 7 per cent and includes all deaths from any cause following operation, one case having been operated upon ten years before death The greatest number, 4, or 57.2 per cent, died within the first year after operation

We cannot say that all of these post operative deaths resulted from tuberculosis or as a result of the operation because accurate data as to the cause of death is very hard to obtain We may assume therefore, that approximately 85 per cent of the patients operated upon will recover from the immediate effects of the operation basing our supposition on the data reviewed in this paper (See Table C)

In series, Table G, are forty living patients from whom we have been able to obtain data as to their present condition The symptoms with which we are most concerned and which are most frequent are, frequency, hematuria, dysuria, loss of weight Six of these cases continued to have hematuria This is 15% of all the cases Whether these patients are cap-

and gave the impression that it was a calcified tuberculous abscess in the right kidney and the pyelogram showed several filling defects and shagginess indicative of tuberculosis The right uretrogram showed a dilated ureter which was distorted and there were several filling defects suggestive of presence of tuberculous granulations

Operation Under para vertebral anesthesia a right nephrectomy and right ureterectomy were done August 3rd, 1926 The pathological report of the resected kidney and ureter was positive for tuberculosis of the kidney and ureter and calculi in the pelvis of the kidney After three weeks' convalescence, he returned to his home, having been referred to the Urological Tuberculosis Clinic for further care and observation

At the clinic he was advised regarding rest and fresh air and diet and he was given serial dilutions of old tuberculin by hypo and mercury vapor quartz lamp treatments twice each week over the bladder region and nephrectomy wound, Methylene blue, grs 1, T I D for five days, together with weekly instillations in the bladder of one per cent Methylene blue in seven per cent saline solution He became free from symptoms after a few weeks treatment. The wound closed and he returned to work apparently well, however he was kept under observation and care for about a year as it is advisable to care for these patients for this period of time in order to prevent possible recurrence At the present time this patient is thought to be an arrested case as he has had no recurrence of symptoms and is going about his daily work in a normal manner

Case 4 This case is descriptive of long post-operative care, yielding very slowly to treatment, but at present has no symptoms and is in very good health

Female, age 60, name C C

Diagnosis Tuberculosis of left kidney

Complications Tuberculous Cystitis

History Nocturia, urgency, frequency of urination, pain in left kidney Duration, two years

Physical Examination Left kidney slightly ptosed No tender areas in abdomen

Cystoscopy Interior of bladder normal except for left ureteral orifice which shows red, indurated areas one inch in diameter Number 6 catheter passed to each kidney pelvis without difficulty Left catheter flowed continuously and was clear until about 15 c c. were collected and then began to look like milk Urine from right side clear throughout Phenol-Sulphone-Phthalein appeared on the right side in two and one-half minutes, left side, four one-half minutes

Report of Ureteral Specimens

	Right	*Left*
Character	Cloudy	Cloudy
Urea	9 gms per L	1 gm per L

Phenol-Sulphone-Phthalein

	Right	*Left*
Appeared	2½ mins	4½ mins
Per cent	10%	Trace
Time	10 mins	10 mins

Microscopic Report

Wet specimen, many erythrocytes, many leukocytes, some leukocytes, some epithelial cells

Report of X-ray Right kidney normal in size, slightly low in position Left kidney also a little low in position There is a distinct enlargement with lobulation and moth-eaten appearance of upper and middle group of calices The arrangement of the pelvis is peculiar in that the upper portion of the shadow seems to communicate with the upper calix of the kidney In view of the fact that this kidney has apparently no function, it is suggested that it be irrigated for a time and if it shows no returning ability to functionate, kidney will be removed under para-vertebral anesthesia.

Guinea-Pig Report Guinea-pig inoculated with 2c c of urine from left ureter Autopsy showed liver normal in size with a few tubercles and the spleen enlarged with many tubercles

Operation A nephrectomy was performed under para-vertebral anesthesia June 5th, 1924, which was successful, patient complaining of no pain or discomfort throughout.

Pathological report was positive for tuberculosis The patient ran a low-grade temperature for about forty-five days and healing took place very slowly, although receiving lamp treatments throughout convalescence, together with dietary regulation for her blood sugar which was 2 83 Patient was discharged sixty days after operation with wound partly open but in very good physical condition Bladder symptoms had practically subsided and the urine was normal Due to the fact that the regular post-operative clinic had not been established at this time the patient's treatment was delayed and when she did finally receive some treatment it was insufficient and irregular Because of the meagre treatment which this patient received we feel that her convalescence was greatly prolonged, however, at present she is free from symptoms and lives a normal life

Results of Post-Operative Treatment

Table I shows the results being obtained under a regular routine, systematic, post-operative treatment which is being administered

hygienic measures, feeding, the administration, in selected cases, of tuberculin, the alpine light, the Krohmeyer lamp and other therapeutic agencies, marvelous results are obtained in the treatment of this much neglected group of cases Indeed a most spectacular result was obtained in one of our first cases, a history of which follows

Case 2

This patient has inoperable bilateral renal tuberculosis A woman, aged 24, married, Italian, whose family and past personal history are irrelevant, began to have dull aching pain in both kidney regions during October, 1925, frequency of urination both day and night, burning on urination, noticeable hematuria at times and she seemed to lose strength During January, 1926, she came under our care Cystoscopy showed cystitis The phenolsulphonephthalein test and urea test to determine the renal function showed that the right kidney seemed to be functioning correctly but the left kidney function was diminished The roentgenologic study, which included pictures of the entire genito-urinary tract with pyelograms, was indicative of renal tuberculosis Guinea pig inoculations with urine from the right ureter and from the left ureter were positive for tuberculosis

It was decided that the patient had bilateral renal tuberculosis which was inoperable, and she went away to the country for a few months During April, 1926, she became a patient at the urological tuberculosis clinic She was advised regarding fresh air, rest, diet and heliotherapy She attended the clinic twice each week and has been given serial dilutions of old tuberculin hyperdermically and bi-weekly treatment with the mercury vapor quartz lamp over the bladder and kidney regions One grain (0 065 Gm) of methylene blue three times a day was prescribed five days each week for the burning and painful urination

She improved a great deal and has only occasional bladder pains and no urinary symptoms except frequency She has gained 16 pounds (7 Kg) and has regained considerable strength (see Table H)

Case 3 The following case is descriptive of the post-operative care following nephrectomy for renal tuberculosis where there was a mild tuberculous cystitis as a complication

Male, age 40, name M B

History Recurrent pain in right kidney region, radiating to the bladder region Frequency and incontinence of urination

Physical Examination No abnormal conditions noted

Cystoscopy Evidence of inflammation in the trigone Elsewhere the bladder seemed normal, except in the region of the right ureteral orifice which was bulging into the bladder in a cervix-like manner and exuding a plug of tenaceous pus

Report of Ureteral Specimens

	Right	*Left*
Character	Milky	Bloody
Urea	4 2/5 gms per L	4 2/5 gms per L

Phenol-Sulphone-Phathalein

	Right	*Left*
Appeared	19 mins	6 mins
Per cent	2%	5%
Time	10 mins	10 mins

Microscopic, Wet Specimen, for Epithelial Cells and Detritus

Report of X-ray Both kidneys appeared normal in size and position and the only evidence of stone in the urinary tract was a shadow in right kidney region, circular in shape and the size of one's thumb The right pyelogram extended to the circular shadow

TABLE H, *Showing Results of Treatment of Inoperable Cases, or Cases Not Undergoing Operations*

Name	Age	Symptoms Preceding Treatment					Guinea Pig		Pyelography		Length of Post Operative Treatment	Relief of Symptoms	Gain in Weight
		Pain in Kidney	Frequency	Burning on Urination	Incontinence	Hematuria	Right	Left	Right	Left

SUMMARY

Consideration of our experiences has convinced us that it is not proper to remove a kidney merely because tubercle bacilli are found in the specimen of urine from that organ In spite of the fact that Medlar's very careful work showed the presence of microscopic lesions in the kidneys of many patients who had no symptoms we feel that unless there is marked diminution in function no kidney should be removed The pyelogram is much more helpful in demonstrating a nephrosis due to tuberculosis than any other examination

Tuberculous nephrosis is almost always a unilateral disease in its primary state The other kidney may be involved microscopically but clinically it is usually a late manifestation

In urological surgery, especially where it concerns tuberculosis of the kidney, exploratory operation is unnecessary as all of the facts are obtainable at the cystoscopic table In fact one learns far more in this manner than can possibly be discovered by looking at the outside of the kidney at the operating table

After a complete general examination has been done, cystoscopy is resorted to If the symptoms are moderate this may be accomplished by using a local anesthesia in urethra and bladder If, however, there is marked urinary discomfort it is better to use sacral anesthesia. This is used in preference to a general anesthetic because the patient will then cooperate in the taking of pyelograms On the rare occasions in which the authors have used ether anesthesia for the purpose of cystoscoping a patient with a particularly irritable bladder, a remarkable temporary relief of symptoms has occurred

There are two manners in which tuberculosis affects the upper urinary tract The rapidly developing type causes a dilatation of the ureter and kidney pelvis in which there are few, if any, tubercles found in the ureter The chronic type, which is by far the more common, is marked by a feathery appearance of the pyelo-ureterogram, due to the presence of tuberculous granulations This type of ureter must be entirely removed as it contains foci which will discharge tuberculous pus into the bladder indefinitely thus prolonging the vesical lesions and symptoms

When the diagnosis has been established it is usually advisable to operate immediately as delay merely prolongs the toxic absorption from the lesions present.

It is our practice to use regional anesthesia, administered after the method of Prof Von Illyes as modified by us The advantages of this type of anesthesia are many There is much less bleeding than noted with any type of general narcosis, the patient is much more relaxed There is no dehydration from abstention from the use of fluids either before, during or after the operation There is rarely nausea or vomiting There is no danger of alighting a dormant tuberculous focus in the lungs

Of the 63 cases studied 31 were operated upon under regional anesthesia Those patients who required no reenforcement in the form of ether were able to leave the hospital nine days sooner than those who had general anesthesia

There were 57 per cent males in this series and 43 per cent females Seventy per cent of the cases were between 20 and 40 years of age The immediate operative mortality was 3 2 per cent During the first year after operation four died Two died within two years after operation and one died ten years after opera-

by the newly formed Tuberculosis Division of the Brady Urological Foundation at the New York Hospital The results shown here do not indicate a rapid clearing up of symptoms but each case showed improvement under treatment Due to the fact that this department has been functionating less than two years, we feel that the time these cases have been under treatment is insufficient to expect much more improvement than has taken place Four of the cases had shown little progress in two or three years since operation, but improvement was noted after a few months under this treatment The other cases were recent and we expect considerable treatment is necessary to show good results

TABLE I—*Results of Post Operative Treatment*

The special urological treatment is carried on by a Urologist and may be described as including bladder irrigation, bladder instillations, prostatic treatment, fulguration of bladder ulcers, cystoscopic observation and ureteral catheterization and pelvic lavage A number of patients suffer from tuberculous cystitis as a complication and the palliation of this distressing condition while carrying on the general tubercular treatment is a difficult problem Methylene blue administered internally and locally in the form of an alkaline instillation is giving fairly good results The general treatment of tuberculosis, fresh air, rest and good food, is prescribed for all patients The diet problem is increased by necessity at times of selecting foods that will not irritate the diseased genitourinary tract In addition to the general treatment of tuberculosis some of the special measures that are in use to treat the disease are also utilized Tuberculin is administered in special cases Koch's old tuberculin is prepared in serial dilutions and given hypodermically Good reports have been made of the value of tuberculin in the treatment of this type of patients at some of the European clinics, and it has a place in the treatment of selected cases Avoidance of reactions, which implies careful use of tuberculin seems to give the best results when this subsidiary agent is being used

Another of the special measures is the mercury vapor quartz lamp, and it is very useful It is almost a specific in the treatment of post-operative tuberculous sinuses of the genito-urinary tract. The sinuses following nephrectomy for renal tuberculosis, epidymectomy and orchidectomy for tuberculosis yield readily to the lamp treatment Bilateral tuberculosis of the epididymes or testes either before or after the disease has suppurated and formed external sinuses can well be given this treatment with the idea that it will help to localize and arrest the lesion as well as to help prevent its further extension

The mercury vapor quartz lamp is also used for tuberculous cystitis, applied in the same manner as in the treatment of tuberculosis of the intestine, in which it has given good results The patients suffering from tuberculosis cystitis are given bi-weekly treatments over the bladder region It is planned to also try intravesical treatment for these patients, with a special applicator and the water cooled mercury vapor quartz lamp The patients who have inoperable renal tuberculosis are given lamp treatments over the kidney regions The results from this type of treatment are as yet uncertain, but the patients seem to feel that they are benefited

Heliotherapy is a very valuable adjunct, and when it is feasible it is added to the general care Sun treatment of patients with diseases of the genito-urinary tract is, of course, difficult to carry out in a large city where the patients are living at home

One of the most spectacular results of our post-operative treatment has been the amazing

ical party One old darkey presented himself for the fifth time to get his "typhoid shot" and when the doctor asked him why he came so often he replied "Ah likes it, hit makes me feel so good"

In one camp, where the pressure of other calls prevented toxin-antitoxin administration, a later outbreak of diphtheria, caused deep regret to all concerned, though only a few cases developed

General camp sanitation, with its water supply, drainage, garbage and sewage disposal and its model latrines, was both a safeguard and an education to many of the men from underprivileged rural homes, while the screened-in mess halls and kitchens with the preparation and care of food was equally instructive to the women and girls Even the milk lines for the undernourished children served their daily purpose and taught their daily lesson

Spacious laundry sheds with scrub boards, tubs and abundance of soap and running water were well patronized luxuries, which contributed to the prevalent personal cleanliness among the white and colored

Camp streets and buildings were kept tidy and clean by squads of refugee men under "Street Captains" appointed and trained from among their own numbers

In some groups it was somewhat difficult to force the use of the sanitary latrines, the refugees insisting the buildings were too nice for such use but ultimately science prevailed

Dr Oscar Dowling, President of the Louisiana State Board of Health, issued an appeal to parish authorities to establish health centers "The State of Louisiana," said he, "will help its overflowed parishes to put in effect health programs Upon the request of Governor Simpson, the board of liquidation has arranged for the use of $62,000 for this purpose which amount will be supplemented by funds from the international health board, the U S. public health service and the Red Cross The health center of the parish is a clearing house for all hygienic, sanitary, medical, dental, nursing and other public health activities"

A report of one of these parish health units for the month of June gives the following summaries "2,000 leaflets and health notices distributed, 4,827 people visited and instructed in health matters, 15 cases of contagious disease isolated, 251 anti-typhoid vaccinations given, 996 privies inspected and 183 have been improved, 598 sources of water supplies improved, 826 wells and cisterns chlorinated, 127 homes visited by the public health nurse

"The health officer has traveled 1,250 miles the nurses 1,000 miles, the inspectors 5,000 miles

"The unit has on hand oil and sprayers for any municipalities calling for them"

The Red Cross is reported to have spent $500,000 on sanitation in the flood area, many unclaimed dead animals were buried, wells, cisterns and cess pools were chlorinated and quantities of lime was provided, for the people are accustomed to the liberal use of whitewash The aesthetic and mental effect was good though they were cautioned by the health officers not to depend on whitewash where a stronger disinfectant was needed

One young medical student, the son of a health officer, gave up a most needed vacation to aid in the inspection and disinfection of wells and cisterns of returning refugees in his father's territory

Prenatal care and lying-in hospitalization were enjoyed by many expectant mothers for the first time though most of them were multi-

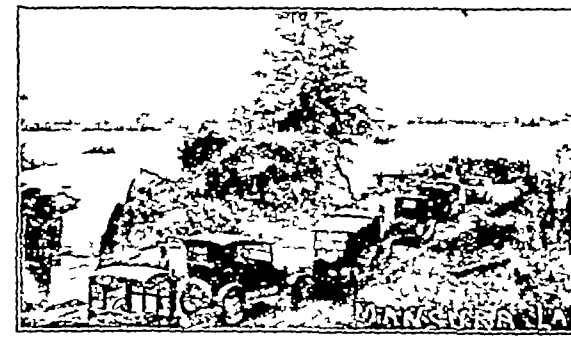

FIG 1 *Vast inundated area.*

para As a result the birth rate in the emergency was kept above the death rate

One health officer discussed with me three cases of ophthalmia neonatorum which occurred in his territory in one week, they were the cases of midwives, who had not been sufficiently alert in the trying time

In one hospital a typical syphilitic baby died weighing only five pounds and seven ounces at the age of five months

Special effort to prevent gonorrhea and syphilis and to inculcate the principles of social hygiene in connection with disaster relief and rehabilitation, was a pioneer experiment, and there was a question in the minds of some as to how such activities would be received by the refugees themselves

The New York State representative was temporarily attached to the Louisiana State Board of Health and whatever was accomplished in the field was made possible by the cooperation of the public health officials both at headquarters and in the field

Some of the welfare organizations in the camps had already sensed the social hygiene needs but were at a loss to know how instruction and guidance could be given

My old preceptor, Dr Vaughn of the Uni-

tion We have been able to follow up 40 additional cases, all of whom are doing well except two One of these, operated upon three years ago has lost weight and is generally miserable, another operated upon two years ago has not gained weight

Study of this series indicates that symptoms diminish in intensity as one gets farther from the operation This is apparently due to the healing of tuberculous lesions of ureter stump and bladder

We are obliged to consider nephrectomy cases as arrested and not cured Therefore, every case should receive post-operative care by those who are experienced in administering it

This care includes the ordinary hygienic measures adopted for the care of the tuberculous patients It includes a diet which will not irritate the urinary tract Fresh air and proper rest are insisted upon Koch's old tuberculin is prepared in serial dilutions and given hyperdermically, avoidance of reactions gives best results

Administration of sunlight or the alpine lamp rays have been of distinct benefit in a large series of post-operative and inoperable cases treated consistently

SOME FEATURES OF SANITATION IN THE MISSISSIPPI FLOOD RELIEF*

By ALBERT J READ, M D, ALBANY, N Y

IT is now considered an established fact, that in great disasters involving the massing of large numbers of refugees attention should be given to preventing the spread of syphilis and gonorrhea and that social hygiene should constitute a part of the relief, rehabilitation and sanitation program

It is a reasonable deduction that the advances made in controlling these diseases in New York State have constituted a material contribution to public health achievement and have had a part in bringing about, what Governor Smith announced as the lowest death rate in the history of the State, representing a saving, in 1927, of 28,000 lives

Just a decade ago the New York State Legislature made an enactment authorizing the organization of a Social Hygiene Division in the State Department of Health, and in a way it may be considered a recognition of the work done here in the past ten years, when the National Red Cross, representing the Federal Government, in the Mississippi Flood Relief, requested our State Department of Health to loan one of the experienced physicians from its Division of Social Hygiene, to aid in inaugurating a new public health activity in that extensive and unusual emergency

In the Mississippi disaster, the Red Cross had for its proteges, the scattered inhabitants from an area one thousand miles long by ten to fifty miles wide, fully twenty thousand square miles, driven hastily out of their homes, bereft of their worldly goods, fathers separated from mothers and parents from children, for weeks before a reunion could be effected, and huddled into veritable tent cities, in close contact with strangers and in a strange environment (See Figure 4)

The problems of sanitation and hygiene presented were such as would arise when six hundred thousand rural people were suddenly forced by flood into a congested camp life

At first the camps and roads leading to them presented a strange and pathetic mixture of refugees, automobiles, mule teams and half famished cows, mules and hogs (See Figure 1)

Thanks to the Texas cowboy volunteers, the live stock was soon herded in safe pasturage, a good distance away

Milk and water supplies were safeguarded scrupulously

Vaccination and typhoid innoculations were given to all irrespective of race, creed or polit-

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 22, 1928.

Some saw in the broken homes and disorganized families only an occasion for lust and greed

It was the behavior of such people and the unsophistication of many of the refugees that made necessary a Social Hygiene program in the refugee camps and surrounding territory

The American Social Hygiene Association, a national organization which rendered most valuable service during the World War furnished able representatives and what was thought by many a most difficult and delicate task resolved itself into a social and disease

FIG. 4 *Tent cities*

problem of a people in distress and meeting that problem with the common-sense methods which the last decade of experience in a great commonwealth, had taught

In one camp a gang of town roughs preying on the unsophisticated refugee girls, was arrested and sentenced to hard labor on the camp public works

In another camp a physician who disgraced himself and his profession was summarily dealt with

In still another camp some prostitutes posed as refugees in order to reap small but ill-gotten gains from impoverished refugee men They were turned over to the custody of the officials in the large city from whence they came

National organizations were asked to provide wholesome recreation and protection service

Conferences were held with educators, health and government officials, business men, parents, camp directors, hospital doctors and welfare workers for the discussion of the dangers and prevention of syphilis and gonorrhea and the need of social hygiene education The New York representative travelled 1800 miles by train, auto and boat in the flooded area, gave 38 lectures to 17,561 people, interviewed 642 prominent persons beside innumerable refugees and aided in relief, rehabilitation and emergency medical work for the flood sufferers

Groups of refugees were instructed on sanitary measures and the proper precautions to take to safeguard their families in the new surroundings and relationships of congested camp life.

Their gratitude to the National Red Cross and Government for this aid was most enthusiastically expressed

One father said, "The loss of my mules, my crops and my buildings is as nothing compared to the physical and moral disaster which could so easily befall my family in all this confusion I shall never forget the Red Cross, the nurses and the doctors who have done so much for us"

The social hygiene activities were commended by Secretary Hoover as one of the progressive and efficient accomplishments of this greatest of all peace-time disasters

At the Flood Relief headquarters much satisfaction was expressed that the outcome of the experiment had justified the launching of the new activity and it was freely predicted that in future great disasters involving the aggregation of large numbers of refugees, due attention would be given to social hygiene education and the prevention of the spread of syphilis and gonorrhea

versity of Michigan Medical College, used to tell his students that any great disaster or calamity, would lead some people to commit misdemeanors and crimes which would never enter their heads in the ordinary, even course of life The truth of his statement was demonstrated in the Mississippi Flood Disaster

In sharp contrast to the altruism and self-sacrifice shown by the great majority, was the selfishness and abandonment of the few

The actual loss of life, a little over three hundred, was surprisingly small for such an extensive disaster where three hundred thousand people were rescued from house tops and

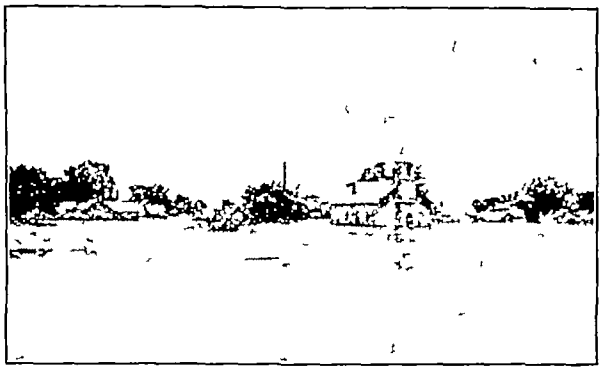

FIG 2 *A deserted town*

other precarious positions and gathered safely into one hundred and forty-nine hastily constructed camps

That splendid record was due to the wonderful response and team-work of the best people everywhere

A former governor of one of the States, at an advanced age, personally conducted rescue and relief work in his vicinity National and State representatives, both volunteer and delegated, rendered efficient services

Nurses, doctors, school teachers, business men and bankers, many of whom gave up enticing vacation trips to do their bit were in evidence everywhere on their errands of hazard and mercy

One refugee doctor, who in devotion to his community was ignoring a call to a more prosperous field, had the misfortune to be domiciled right in the path of a break in the levee and the onrushing flood ruined his home and everything he possessed on earth (See Fig 3) I found him busily engaged ministering to the refugees who from miles around were concentrated in one of the hastily constructed camps

He was evidently too busy to think of himself or his own property I found that he had not even taken time to go back to see what could be salvaged from the wreckage Perhaps the reports of others was all he could bear to know, and it was important that he stand by his post in the disaster

The doctor's surprise and gratitude when the Red Cross remunerated him for his services and took steps to reestablish him in his community, which though unable to pay, would sorely need his ministrations for the twelve or eighteen lean months to follow, was a study and a benediction

Scores of other doctors in the flood area, went through similar experiences with a degree of fortitude and self-sacrifice that made one proud of the medical profession

A nurse left a remunerative and comfortable position, made her way by mule team and boat and by aeroplane into the most hopelessly marooned section and before the official equipment could arrive had directed rescue work, had organized a temporary camp of refugees with extemporized facilities and had prevented by her skill and prompt action the spread of a beginning epidemic of smallpox among her proteges

Her services were so valuable that when the authorized representative and equipment arrived and they saw what this former Red Cross nurse had accomplished almost single handed and unequipped, they placed her in charge of the fully equipped camp which sheltered thousands of homeless refugees, throughout the emergency

It was an interesting fact that the keen observation of such people in the thickest of the rescue and relief activities was the first to recognize the need of Social Hygiene safeguards among the six hundred thousand refugees who finally found their way into these camps

On the other side of the picture were those

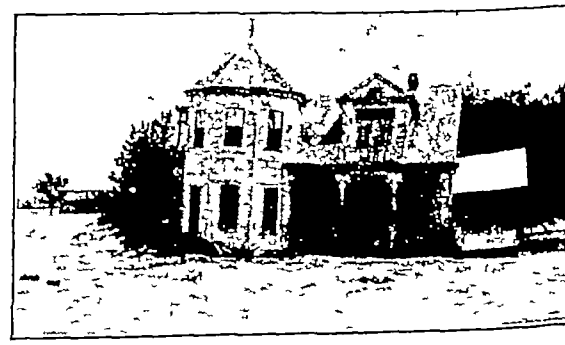

FIG. 3 *A doctor's wrecked home*

few in whom the very same emergency brought out some of the worst characteristics

Some of the refugees themselves saw in the catastrophe from which they had barely escaped with their lives, only an opportunity to be supported in idleness and nothing short of recalling their meal ticket could induce them to work with their fellows on the necessary camp jobs

UROBILINURIA IN CHILDREN WITH HEART DISEASE (Preliminary Report)*

By M H EDELMAN, M D, NEW YORK, N Y
From the Pediatric Department of the Post Graduate Medical School and Hospital.

FOR many years various investigators have attempted to explain the origin and mechanism of urobilin formation as well as its physiological and pathological significance

All types of cases were studied and as a result it was generally agreed that there was an increased urobilin output in the urine in the presence of certain diseases and under some alterations of body conditions In general, it might be stated that urobilinuria occurs with *diffuse hepatic lesions, pernicious anemia, unobstructed jaundice, fevers (pneumonias), diseases associated with extensive destruction of red blood corpuscles,* and *in heart disease*

At this point the literature becomes very scant This is probably due to the fact that there were very many technical difficulties in urobilin estimation to be overcome by the early workers The method of estimation adopted by us is that of Ellman and McMaster of the Rockefeller Institute It is considered more sensitive and accurate than any of the previous methods, and Dr Killian, under whose supervision our laboratory work was done will discuss that phase for you We simply assume the privilege of bringing before you the clinical results and our interpretations

While urobilin is a normal constituent of the feces it is not normally found in the urine However, as a result of our investigations we have found urobilin in the urine of apparently healthy children at various times, in quantities up to 3 mgm per 100 c c or 30 mg per 1000 c c Unless there are some clinical manifestations to account for this finding we feel that this occasional appearance of urobilin is a physiological occurence, just as we may observe a physiological leukocytosis We therefore attach no particular significance to this occasional appearance of urobilin, and in this report we have designated these quantities of less than 3 mgm per 100 c c as a trace and very faint trace, and have considered them negative or normal

When the quantity of urobilin in the urine is 3 mgm per 100 c c or more, we always consider the amount abnormal or pathological This abnormal increase in the daily output of urobilin is spoken of as urobilinuria

In concerning ourselves with urobilinuria in children with heart disease, we adopted a comparatively simple method of reasoning Our practical approach to the problem was simple and compelling

We knew that hepatic dysfunction resulted in varying degrees of urobilinuria, also that cardiac decompensation resulted in passive congestion of the liver with its attendant hepatic dysfunction and resultant urobilinuria Could the amount of the dysfunction be measured by the output of urobilin?

Since it is reasonable to assume that in the more gravely decompensated heart there exists a more gravely congested liver whose function is proportionately impaired, we hoped it might be possible by repeated quantitative estimations of urobilin, to determine the relative amount of diminution of cardiac efficiency That is, we were desirous of establishing a standard for the measure of loss of cardiac function that would be more sensitive than our present clinical standards At the same time, by periodic determinations throughout the course of the disease, we felt that we might be better able to gauge the condition and amount of recovery of the affected heart at any period

Our work indicated that urobilin estimations can serve both as a standard and guide in reestablishing the normal routine of a child who has suffered a breaking of cardiac compensation We feel that when the urobilin has reached and remained at a quantity within the normal range (up to 3 mgm per 100 c.c) and in the absence of fever or other untoward clinical signs, we can then get the child out of bed, and gradually resume normal daily activities, watching the effect of each added burden on the urobilin output

The re-appearance of urobilinuria at this stage we interpret as evidence of incomplete compensation

In the course of our studies many interesting and practical clinical possibilities suggested themselves

From our study we have found that the majority of those children who were gotten out of bed before the urobilin had reached a constant normal level, often when there was ample clinical evidence of good compensation, the urobilin output rose and the patients were clinically worse It therefore seems logical that it is a safer procedure in the management of these cases to wait until the urobilin has reached and remained at a normal level before permitting them to get up Further estimations of the daily output should then be made, and if the urobilin remains within the normal limits, the patient's activities may be gradually increased The effects of each added burden can be estimated by urobilin determinations

We have also noted that in the presence of heart disease without complete compensation, as evidenced only by a urobilinuria, various operative measures, nearly always resulted in an appreciable and sometimes alarming urobilinuria (In one case the urobilin rose to 586 mgm. per 100 c c) Simultaneously we had evidence of failure

THE SIX HUNDRED AND FIFTIETH MAN IN DIPHTHERIA PREVENTION

By NATHAN B VAN ETTEN, M D, NEW YORK, N Y

In the State of New York every 650th man is dedicated by his oath to the public and private health of eleven and a half million people

There are 17,652 of him and his average length of time in service is now about twenty-five years

The oldest have been at work about sixty-five years

His required education is greater than that demanded by the State for the licensure of any other person

Because of the nature of his education and the time required to complete it, he begins to earn his living at about his twenty-seventh year

His average earnings are less than those of many artisans He is always on call, his current life a turmoil, his future an uncertainty

Consecrated to an ideal, if occasionally material success comes it is merely as a bi-product of unselfish service

He deserves the respect, affection, protection and support of those whom he serves Individually he may be reactionary or static Collectively he is progressive Twelve thousands of him are organized in this State for the safeguarding and promotion of physical and mental health

Individually he cannot violate inherited traditions which forbid public advertisement of his accomplishments

Collectively he must announce the progress of science and his readiness to apply advancing knowledge to the prevention and cure of disease

The fact that only about five percent of his practice is concerned with communicable disease should induce tolerance and patience with his slowness to rise to the highest co-operation in a campaign for the prevention of Diphtheria

While he has known about Toxin Antitoxin for fifteen years he has been feeling his way in its employment, studying the growing statistics of practical immunity and the statistics of immunity revealed by scientific tests

He who calls himself a general practitioner and he who calls himself a pediatrician, a general practitioner for children only, are those who have most actively responded to the stimulus of this militant campaign—the dramatics of which have been absolutely necessary in order to arouse the public conscience

He who practices a limited specialty has been slower to realize his responsibilty for the lives of children But in general no Public Health movement within our recollection has enlisted more universal and enthusiastic co-operation

In the twenty-two upstate counties which have reported no Diphtheria deaths for 1928 the general practitioner must be credited with this glorious achievement and to him and to the pediatrician we must look for the future success of immunization

In localities where intensive immunizations have been carried on with great success, no one should feel that the work is complete, when in reality it has only caught up with arrears and the real work of preventive immunization of the yearling and of the pre-school child has just begun

The stimulating excitement, the publicity, even the disagreements between participants concerning campaign methods have been indispensable as promotion—but after the campaign is over the general practitioner and the pediatrician will carry on through the years the high standards that are now erected Much has been learned in the past three years of the difficulty of filling the full measure of such a slogan as "No Diphtheria in Five Years", and yet with the completion of more than five hundred thousand of the one million two hundred and fifty thousand immunizations planned for this period it may reasonably be expected that with active work in Buffalo and in the City of New York with three or five years extension of unremitting effort, steady progress will be made toward the lowest annual case rate and death rate in this or any other state Diphtheria may not be entirely wiped out in cities which are visited by large numbers of unprotected people, but a death rate of one or two per hundred thousand is quite attainable

The enlisted forces, the layman, the official, the scientist, the medical practitioner, the publicist are carrying on a magnificent work

It is inevitable that a highly sustained drive must yield to a slower pace, but lay and official organizations must continue a never ending education directed toward the parents and guardians of children

Parents should know that the fight against Diphtheria is in no sense experimental, that the physician knows the cause, the diagnosis, the dependable remedy, if used early enough, and the preventive agent

The educated parent will be held directly responsible when a child dies from Diphtheria if he shall have failed to ask for protection by Toxin Antitoxin

Organizations for the distribution of information concerning the prevention of disease will influence an increasing popular appreciation of the fact that Diphtheria is preventable, that a death from it is a family and community disgrace, and that your six hundred and fiftieth man is at all times ready and able to prevent it.

UROBILINURIA IN CHILDREN WITH HEART DISEASE (Preliminary Report)*

By M H EDELMAN, M D, NEW YORK, N Y
From the Pediatric Department of the Post Graduate Medical School and Hospital.

FOR many years various investigators have attempted to explain the origin and mechanism of urobilin formation as well as its physiological and pathological significance

All types of cases were studied and as a result it was generally agreed that there was an increased urobilin output in the urine in the presence of certain diseases and under some alterations of body conditions In general, it might be stated that urobilinuria occurs with *diffuse hepatic lesions, pernicious anemia, unobstructed jaundice, fevers (pneumonias), diseases associated with extensive destruction of red blood corpuscles,* and *in heart disease*

At this point the literature becomes very scant This is probably due to the fact that there were very many technical difficulties in urobilin estimation to be overcome by the early workers The method of estimation adopted by us is that of Ellman and McMaster of the Rockefeller Institute It is considered more sensitive and accurate than any of the previous methods and Dr Killian, under whose supervision our laboratory work was done will discuss that phase for you We simply assume the privilege of bringing before you the clinical results and our interpretations

While urobilin is a normal constituent of the feces it is not normally found in the urine However, as a result of our investigations we have found urobilin in the urine of apparently healthy children at various times, in quantities up to 3 mgm per 100 c c or 30 mg per 1000 c.c Unless there are some clinical manifestations to account for this finding we feel that this occasional appearance of urobilin is a physiological occurence, just as we may observe a physiological leukocytosis We therefore attach no particular significance to this occasional appearance of urobilin, and in this report we have designated these quantities of less than 3 mgm per 100 c c. as a trace and very faint trace, and have considered them negative or normal

When the quantity of urobilin in the urine is 3 mgm per 100 c.c or more, we always consider the amount abnormal or pathological This abnormal increase in the daily output of urobilin is spoken of as urobilinuria

In concerning ourselves with urobilinuria in children with heart disease, we adopted a comparatively simple method of reasoning Our practical approach to the problem was simple and compelling

We knew that hepatic dysfunction resulted in varying degrees of urobilinuria, also that cardiac decompensation resulted in passive congestion of the liver with its attendant hepatic dysfunction and resultant urobilinuria Could the amount of the dysfunction be measured by the output of urobilin?

Since it is reasonable to assume that in the more gravely decompensated heart there exists a more gravely congested liver whose function is proportionately impaired, we hoped it might be possible by repeated quantitative estimations of urobilin, to determine the relative amount of diminution of cardiac efficiency That is, we were desirous of establishing a standard for the measure of loss of cardiac function that would be more sensitive than our present clinical standards At the same time, by periodic determinations throughout the course of the disease, we felt that we might be better able to gauge the condition and amount of recovery of the affected heart at any period

Our work indicated that urobilin estimations can serve both as a standard and guide in re-establishing the normal routine of a child who has suffered a breaking of cardiac compensation We feel that when the urobilin has reached and remained at a quantity within the normal range (up to 3 mgm per 100 c c) and in the absence of fever or other untoward clinical signs, we can then get the child out of bed, and gradually resume normal daily activities, watching the effect of each added burden on the urobilin output

The re-appearance of urobilinuria at this stage we interpret as evidence of incomplete compensation

In the course of our studies many interesting and practical clinical possibilities suggested themselves

From our study we have found that the majority of those children who were gotten out of bed before the urobilin had reached a constant normal level, often when there was ample clinical evidence of good compensation, the urobilin output rose and the patients were clinically worse It therefore seems logical that it is a safer procedure in the management of these cases to wait until the urobilin has reached and remained at a normal level before permitting them to get up Further estimations of the daily output should then be made, and if the urobilin remains within the normal limits, the patient's activities may be gradually increased The effects of each added burden can be estimated by urobilin determinations

We have also noted that in the presence of heart disease without complete compensation, as evidenced only by a urobilinuria, various operative measures, nearly always resulted in an appreciable and sometimes alarming urobilinuria (In one case the urobilin rose to 586 mgm. per 100 c.c) Simultaneously we had evidence of failure

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany May 23 1928.

of cardiac compensation as determined by older standards

May we not infer from this, that it is wiser to defer non-urgent operative procedures until the urobilin output has returned to and remained at a normal level

The cases studied were those confined to the Babies' Wards of the N Y Post Graduate Hospital, and those in attendance at the Cardiac Clinic of the Pediatric Outpatient Department These cases varied from those with grave decompensation, to those children attending our Cardiac Clinic who suffered no apparent symptoms and on whom no restrictions had been placed

A total of 584 cases were studied in which over 3,000 estimations were made To simplify our studies we divided our cases into four groups, namely

I *The Control group* II *The Comparative group* III *The Ambulatory group* IV *The Decompensated group*

The Control group numbered 350 cases, and was derived from children, apparently healthy, admitted to the hospital for the removal of tonsils and adenoids Of this large group only *15 or 4% were positive,* and *335 or 96% were negative* The urobilin in this group ranged from *3 to 9 mgm per 100 c c ,* except in two cases where it reached *94 and 188 mgm per 100 c c* respectively The case in which 94 mgm was found, was a case of urobilinuria of unknown origin, which had an *icteric index of 10* As a result of these findings it was deemed unwise to operate, and the child was referred to the out outpatient department for a detailed study After two weeks he was readmitted His condition was improved, and the icteric index, liver funciton tests, blood and urobilin were normal The child was operated on, without any resultant urobilinuria For the case with 188 mgm we were unable to find a cause or satisfactory explanation The child had been operated on before any further investigations were made However, his tonsils were removed without any injurious effect, or increased urobilinuria

In this control group, all of whom were operated on for the removal of tonsils and adenoids, *50 of the 350 cases* were observed as to their urinary urobilin before and after the operation and only one showed a post operative urobilin reaction of 9 mgm per 100 c c This urobilinuria may be accounted for in two ways the child had a hemoglobin of 55% as a result of post operative bleeding, causing a rather definite secondary anemia, and he also was suspected of having a beginning endocarditis Forty-eight hours after the operation his urine became negative for urobilin and remained so until his discharge one week later

II *The Comparative group* is composed of 32 non-cardiac bed-ridden cases of the usual hospital type These were studied for their comparative academic interest alone. In this group *11 or 34% were positive,* and *21 or 66% were negative* The urobilin ranging *from 3 to 24 mgm per 100 c c* Among these positives, there were many belonging to a class of cases where one would expect to find a urobilinuria

A detailed discussion of these cases is omitted, as our only concern in this paper is with urobilinuria in children with heart disease.

III *The Ambulatory group* consisted of 152 heart cases from our Cardiac Clinic. Of this group *41 or 26% were positive,* and *111 or 74% were negative* The urobilin in this group ranged from *3 to 24 mgm per 100 c c* In the studies of this group we were somewhat handicapped by the poor co-operation of our clinic mothers However, we have observed, and are still observing, that in those children with urobilinuria, rest in bed, in the majority, resulted in a disappearance of the urobilin and these children were benefited clinically Operative procedure, such as tonsillectomies, in this group, of which we have only five cases, did not show any resultant urobilin reactions We had hoped to demonstrate by this group that an increasing urobilinuria forewarned us of an impending decompensation, but unfortunately the poor co-operation of the mothers prevented us from establishing this fact However, from our observations in the decompensated group we feel that such is the case

IV *The Decompensated group* consisted of 50 bed-ridden cardiac cases in various stages of decompensation Of this group *44 or 88% were positive* and *6 or 12% were negative* The urobilin estimations in this group reached the highest peaks observed in any of our studies, ranging from *3 to 586 mgm per 100 c c*

Fourteen of the positive cases in this group were subjected to various operative procedures such as tonsillectomy, extraction of teeth, transfusion, myringotomy and bronchoscopy Twelve of the fourteen showed urobilin reactions of varying degree, ranging from a mild to a severe urobilinuria Of the two in which there was no reaction it is of interest to note that one was a case of lymphatic leukemia with what proved to be a hemic murmur and the other was an acute rheumatic fever with no definite cardiac involvement. In contrast to these findings we had two cases of the negative group in which a tonsillectomy was done and there was no resultant urobilin reaction

In the same Decompensated group, there occurred five cases in which there were coincidental complications, such as gastric upsets, upper respiratory infections and asthmatic attacks In every case so complicated there was a resultant urobilinuria

A comparison of the results obtained, in our studies, of the different groups, reveals facts which are of noteworthy importance and ought to be emphasized

First Our greatest number urobilinurias were

obtained in our studies of the decompensated group

Second These urobilinurias reached the highest levels, observed in all our studies

Third Operative procedures in the decompensated group resulted in the severest urobilin reactions

Fourth These post-operative urobilin reactions were practically confined to the cases of the decompensated group, occurring in 12 of 14 children These reactions did not occur in the five cases subjected to operation in the ambulatory group, and in only one of the 50 cases of the control group, and that one may be accounted for by a definite secondary anemia and a possible endocarditis

At this point it might be well to mention that it has been recognized that some children with heart disease show a persistent urobilinuria even though there is every clinical evidence of complete compensation Fisher of Heidelberg, considers this as evidence of some permanent pathological condition of the liver, and we fully agree, since in our studies we have come across such cases

Conclusions

From these preliminary studies we have drawn the following conclusions

1 Urobilin is not commonly found in normal urines It has been found in quantities less than 3 mgm per 100 c c. without any cardiac disease. When the urinary urobilin exists in quantities of 3 mgm per 100 c c. or more, it is always abnormal or pathological All estimations must be made on the daily output of urine

2 In children with cardiac decompensation, as a result of liver stasis and dysfunction, there is an abnormal increase in the daily output of urobilin in the urine and the increase is proportionate to the degree of decompensation The more the decompensation, the greater the quantity of urobilin in the urine

3 Frequent estimations of urobilin may serve the clinician as an indicator of the progress of the affected heart, and may be used as an additional test to guide him in the management and care of such children From our observations this test is more sensitive and reliable than any of the other standards, and is simple in its application. We were better able to follow the progress of our heart cases by the observations of the urobilin estimations, than by all other standards

4 The cardiac child should be confined to bed until the urobilin remains at a normal level, even though all other clinical signs are favorable Furthermore, any cardiac child with a urobilinuria, should be put to bed until the urobilin has become normal

5 Non-urgent operative procedures should be avoided in the presence of an incompletely compensated heart, as may be evidenced only by a urobilinuria This statement is further emphasized by the fact that in some of our cases, the urobilin was high, when the pulse, temperature and leukocyte count were normal Operative procedures in the presence of urobilinuria usually resulted in an increased urobilinuria and a poor clinical state of the child

6 Coincidental complications, in the course of decompensated hearts, such as gastric upsets, upper respiratory infections, etc, and premature physical effort usually showed a resultant urobilinuria.

7 Comparative studies of all our cases show the greatest number of urobilinurias occurred in the decompensated group, next in the ambulatory group and the least in the control group Post-operative urobilin reactions occurred in 12 of 14 children in the decompensated group, in only one of the 50 cases in the control group, and no reactions in five cases of the ambulatory group The highest levels of urobilin estimations and the severest reactions occurred in the decompensated group

8 Because of the alarming rise of urobilin prior to death, this determination may be of some benefit in the immediate prognosis

These conclusions have been stated, not so much to be accepted as established facts, but to encourage further studies along the lines suggested We ourselves have only just begun, and from the encouraging results obtained it certainly warrants a continuation of this study We invite confirmation or criticism which may arise from future studies The procedure is so simple, that it requires no special training or technique, and is available to every physician who daily faces the problem of the cardiac child

We feel that urobilin estimations will greatly facilitate the study and have an important position in the management and care of the cardiac child

May I in closing state that I am indebted to Drs Dennett, Pease and DeSanctis for their cooperation and permission to study heart cases admitted to their respective services, and to Drs Muns and Nichols for their permission to study heart cases admitted to the ambulatory heart clinic To the other members of the staff and Miss Halpern of the chemistry laboratory I make public recognition of their services rendered

WORKMEN'S COMPENSATION

A PUBLIC FORUM BY THE MEDICAL SOCIETY OF THE COUNTY OF NEW YORK

A PUBLIC forum meeting on Workmen's Compensation was conducted by the Committee on Civic Policy of the Medical Society of the County of New York on Friday evening, February 15, 1929, with the Chairman, Dr Frederick W Bancroft presiding The meeting lasted from 8 45 until midnight The program was as follows

1 "Results of the Study of the Medical Provisions of the Act," by Professor Lindsay Rogers, Moreland Commissioner

2 "From the Standpoint of Carrier," by Mr John F Turn, Vice-President of the Aetna Casualty and Insurance Company

3 "What the Doctor Wants," by Dr Morris Rosenthal, New York

4 "Collecting for Medical Service," by Dr W Warren Britt, Towanda, Chairman of the Committee on Medical Economics of the Medical Society of the State of New York

5 "Open Discussion," closed by Dr Raphael Lewy, Albany, N Y, Chief Medical Advisor, State Department of Labor

---

REPORT OF PROFESSOR LINDSAY ROGERS

The first number of the program to be presented was the report of Professor Lindsay Rogers, Commissioner under Section 8 of the Executive Law known as the Moreland Act, "To examine and investigate the administration of the Department of Labor of the State of New York" Commissioner Rogers had made a report in three parts to the Governor of New York Part 1, on "Charges of Fraud," June 1, 1928, Part 2, "Bureau of Workmen's Compensation," June 15, 1928, and Part 3, "Medical Problems," December, 1928 The third report consisted of about 13,000 words, and was printed in a pamphlet which was distributed widely by the Department of Labor to county medical societies and to groups of physicians interested in workmen's compensation This report was that to which reference was made in the program Extracts from that report, and especially its conclusions, were read by Dr Morris Rosenthal at the opening of the meeting Since this report touched upon nearly all the points that were brought out during the evening's discussion, the following abstracts are here reproduced

"Section 13 of the Workmen's Compensation Law provides that the employer must furnish to his injured employees the medical, surgical, or other treatment which 'the nature of the injury of the process of recovery may require'"

"No one concerned with the administration of the Workmen's Compensation Law can deny that there are extremely serious evils which result in hardships both to claimants and to employers The pity is that the proper remedies are by no means so clearly indicated as are the evils

"About 20,000 compensable cases come annually before the Industrial Board Practically every one of these cases requires some medical attention The cost of such medical care amounts to approximately 30 per cent of the payments of compensation benefits During the fiscal year ended June 30, 1927, benefits amounted to more than $26,000,000 The annual cost of medical care, therefore, is approximately $8,000,000

"The carrier must see to it that *medical bills are kept as low as possible* The cost of medical care now amounts to nearly one-third of the total payment of benefits Mounting costs and the difficulty of controlling cases have led a number of the insurance companies to establish clinics of their own, usually in charge of a doctor who is on an annual salary

"Doctors who can quote a low charge are favored in respect of contracts This competition results from the fact that the law does not allow the injured employee the free choice of his physician The employee may go to any physician that he selects, and refuse to go to any other, but unless the employer authorizes treatment, the employee must pay the medical bills himself

"It frequently happens, however, that, in spite of the importunities of the insurance companies, the employer authorizes treatment by physicians other than those in the insurance clinics or those on the preferred list From this results the practice of 'lifting' cases It is engaged in by the insurance companies to get patients to their own clinics, or to compensation doctors of their own choice, and by the compensation specialists themselves They not only attempt by anticipatory contracts to take business from the general practitioners, but after cases are being handled by the general practitioners, they attempt to persuade employees to forsake the doctors selected and go to those favored by the insurance companies The methods used by insurance carrier thus to secure control of their cases, are frequently reprehensible"

The bulk of compensation practice is made to flow through the insurance company clinics and the doctors who specialize in this type of work There are, however, many cases, some long continued, which are treated by doctors who are not in continuous relations with the insurance companies When such treatments are given two questions arise (1) Has the employer authorized a particular doctor to treat his injured workmen, and (2) Is the bill rendered by such doctor reasonable?

"To the physicians who specialize in compensation work, the obtaining of business has become almost as important as the treatments themselves Many different factors play their part The rewards are so great that doctors compete with each other for business Many of them advertise, many of them pay commissions or give other considerations for business sent to them In the past, instances have not been infrequent of doctors splitting fees with the insurance company adjusters who assigned cases for treatment

"Specialization and expertness are confined to relatively few physicians A lay commissioner like myself should hesitate to express positive opinions on this score I have had brought to my attention, however, a considerable number of cases in which it was apparent that injured workmen did not receive from the compensation clinics the expert treatment to which they were entitled

"The research group of the Committee on Traumatic Surgery, appointed by the Board of Regents of the American College of Surgeons, in a report made in October, 1926, raises serious doubts as to whether a considerable percentage of the medical payments under compensation laws is not being wasted The conclusions of the research group pertinent to the matter under discussion are as follows

"A careful study of a large amount of statistical data justifies the statement that there is a definite tendency on the part of many physicians to retain cases and treat them whether beyond their surgical skill or not, and we see a definite disinclination to seek consultation or render cooperation

"Thirty-seven thousand examinations of claimants for compensation are annually made in New York City by the Medical Division of the Department of Labor The annual total of the examination throughout the State is fifty-four thousand The Law provides (Section 9) that 'an injured employee claiming or entitled to compensation shall submit to such physical examination as the Commissioner or the Board may require.'

"I recommend that the law be amended so that no physicians other than the State doctors—that is, no physician representing either the employer or the employee—be permitted in the examining rooms of the Department of Labor during the examination of claimants and the dictation of medical reports

"The manner in which the Medical Division of the Department of Labor now functions by reason of the provision of the law permitting the presence of carriers' physicians, affords greater opportunities and more pressing invitations for fraud and improper relations than does any other phase of the administration of the Compensation Act Of the physicians who specialize in compensation work and who appear before the Department continually, ten are doctors who have been attached to Dr Lewy's staff Their experience in compensation medicine was gained as employees of the State and they then graduated to enter the service of carriers and employers and to enjoy incomes in comparison with which the salaries paid by the State are beggarly pittances

"Successive reports by Dr Lewy have called attention to the fact that medical examiners are grossly underpaid and that it is therefore difficult to secure and retain the services of qualified men The Chief Medical Examiner receives ten thousand dollars a year Salaries for the doctors on the staff have been low The Legislature at its last session raised the stipend to five thousand dollars Although some of Dr Lewy's associates have been in the service of the Department for years, and others have had practically no experience, they all receive the same salary It is hardly necessary for me to say that, under such conditions, the services of properly qualified men cannot be retained, and that the rigid uniformity which the Legislature has ordained reduces the morale and efficiency of the staff

"Certain physicians representing claimants had been guilty of perjury It is obvious also to those intimately concerned with the administration of the compensation statute that certain specialists employed by the carriers file reports which are briefs for their clients rather than expert opinions of injuries which have been sustained The unscrupulous qualities of a physician are sometimes so well known that the referees and the Industrial Board will not accept his opinions if there is available any contrary medical testimony, even from an unknown physician The danger is that in some cases there is no opposing testimony

"The insurance carrier has no legal right to require the employer to send his injured workers to a certain physician Authorization by the employer even though it may be against the wishes and instructions of the insurance carrier, is sufficient to make the carrier liable The only recourse of the carrier if the employer insists on authorizing unsatisfactory physicians, is to cancel the insurance policy on the ground that the employer has failed to cooperate with the company

"Doctors and medical societies made strong representations to me that there should be a 'free

choice of physicians'—that, the injured worker should be permitted to select his own doctor I cannot but believe that such a free choice of physicians would have greater evils than has the present requirement of the law The insurance carriers have to take precautions now against over-treatment by the compensation specialists They would be almost helpless against over-treatment by doctors freely chosen by claimants Even with a schedule of low fees, medical costs would mount rapidly

"One referee in the Department of Labor passes on questions of authorization and the reasonableness of the bills submitted by physicians who do not specialize in compensation work Physicians who collect their bills through the Industrial Board are almost unanimous in their criticisms of the procedure and of the attitude of insurance carriers Of course, much is said in exculpation of the insurance carriers Even the president of one of the medical societies which protested to me gleefully told me of a bill which he had presented to an insurance company and which he had deliberately made high because he feared that it might be cut down He was fortunate The cut was not so great as he expected

"On the other hand, many reputable physicians come before the Industrial Board with bills that are perfectly reasonable, and are worn out by the procedure of collection Some carriers save considerable sums on their medical costs through requesting adjournments of the medical bill cases or contesting the cases so strenuously that a busy and reputable doctor is unwilling to spend the time and suffer the humiliation which the collection of a bill through the Industrial Board entails This, it seems to me, is a matter which cannot be cured by legislation

"Many reports have reached me of representatives of insurance companies or compensation agencies posing as employees of the Department of Labor The claimant is informed that his compensation will not be paid unless he is attended by a physician approved by the carrier Here the insurance company carries one step further the deceit which was referred to above

"Requests were made to me by medical societies and individual doctors to investigate such 'case lifting,' and to recommend methods by which it could be prevented The matter, however, is not one which calls for legislative or departmental action The complainants themselves admit 'that in some instances the carrier was justified in taking the case from the doctor because of the doctor's poor handling of the case and his refusal to cooperate with the carrier' The physicians and the insurance companies must themselves agree on the manner in which the number of unjustified cases can be reduced"

"The law says that medical and hospital fees are subject to regulation by the Industrial Board with the limitation that they shall not be greater than 'such charges as prevail in the same community for similar treatment of injured persons of a like standard of living' This language invites the Industrial Board in conference with representatives of hospitals and the insurance carriers to determine scales which are just and equitable to all parties in interest I simply recommend that this invitation be accepted

"The medical problems under the Workmen's Compensation Act have existed for a long time. Seven years ago a committee on medical questions reported 'that a little more mutual understanding on the part of the doctors, employers and insurance carriers, a little patience and common sense on the part of the administrators and a few minor amendments to the Workmen's Compensation Law, would straighten out a majority of the complaints and remedy most of the abuses'

"I disagree completely, however, with the statement 'that a little more mutual understanding' will 'remedy most of the abuses' My conviction is that the situation demands a thorough exploration by the medical societies which have the interests of the medical profession at heart The doctors should themselves draw up a code of ethics defining what is, and what is not, permissible in the way of advertising and soliciting business The medical societies should determine what practices in respect of the sharing of fees are ethical, and what are not ethical, they should determine how far doctors may lend themselves to the lifting of cases and other objectionable practices by insurance companies The situation in these respects cannot be cleared up by legislative or administrative action A few amendments of the law seem desirable, but the Legislature cannot change the hearts of insurance companies, or make doctors more ethical The matter, nevertheless, is of great concern to the State in its efforts efficiently and equitably to carry out the purposes of the Workmen's Compensation Act

"There is no specific provision in the statutory law of New York against corporations practicing medicine The common law of the State, however, when considered in connection with the provisions for the examination of physicians before they are licensed, and annual registration (Public Health Law, Sec 161) make it *ultra vires* for a corporation to attempt to practice medicine.

"Apart from the insurance clinics, there is only one corporation concerned with furnishing medical care under the Workmen's Compensation Act This is the Wolff Industrial Service, Inc The only clause of its Certificate of Incorporation relevant to the principal activities of the Wolff Industries Service, Inc, is as follows

" 'To recommend, furnish and to procure as such agent, physicians and surgeons to such employers or insurance companies or others in event of accident to employees or otherwise'

"Existing conditions, it seems to me, can only be improved through action by the doctors them-

selves The doctors can only take this action through their associations which attempt to elevate the standards of the medical profession Except to the limited extent that I have indicated above, the situation cannot be improved by legislation or by the administrative officers of the Bureau of Workmen's Compensation

"I recommend also that copies of the present Report be sent to all the County Medical Societies in the State, and to all groups of doctors who have affiliated because of special interest, and that you urge upon these societies the desirability of their careful consideration of the matters which I have called to your attention"

THE POINT OF VIEW OF THE INSURANCE COMPANIES

By MR. JOHN F TURN, AETNA CASUALTY AND INSURANCE COMPANY

The point of view of the Insurance Companies was presented in a paper written by Mr John F Turn, Vice-President of the Aetna Casualty and Surety Company and read by Dr Harry M Archer of the Company The following extracts indicate the attitude of the Company

"'The insurance carrier believes that compensation laws are an economic necessity, and that only through the passage of such laws could industry carry the major portion of the expense of injuries or death to employees in the course of their employment It was public demand that industry bear this burden that forced the passage of such laws The first law passed was the United States Federal Law for Federal Employees, in 1908, and Compensation Laws are now operating in most states The New York State Law has now been operating since July 4, 1914'

"Every business, whether it be conducted by an individual, partnership or corporation, is entitled to a reasonable profit on its undertakings This principle is recognized in the rate-making processes for insurance charges, save and with the single notable exception of the compensation business, there being no element of profit in its rate structure This condition makes compensation insurance an unattractive line to write in so far as underwriting profit is concerned, yet all substantial carriers believe it a duty to have a part in this great work of providing compensation for the injured workman or his dependents

"The insurance carrier must seek the best of medical and surgical service for injured workmen, for the economic reason that the quicker the injured workman returns and assumes his occupation, the sooner compensation payments terminate The insurance carrier owes a duty to the employer to not only efficiently administer the Compensation Act, but also to avoid waste and unnecessary expense, since all costs, including claim payments and compensation and medical, surgical and hospital costs, affect the rate of premium paid by the employer for his insurance Therefore the carrier seeks to obtain the medical and surgical attention required by the injured workmen at a reasonable and fair level of the fee cost, and when such fee, in any case, has been agreed upon, and the doctor has filed on forms provided by law, the necessary detailed information, the payment by the carrier of the doctor's bill is reasonably prompt and definitely certain

"The amount of compensation to be paid is fixed and defined by law, and therefore in the make-up of the rate the use of experience tables enables the companies to very closly estimate how much premium is required for the payment of compensation Medical and surgical fees not being on a level basis create a problem in estimating what these charges should be in the make-up of the rates To administer the provisions of this law with satisfaction to all concerned is a real problem We must provide efficient and satisfactory medical service, and to do this we must maintain satisfactory relations with the medical and surgical *profession* Therefore, speaking as an officer of one of the insurance carriers, I say we need your helpful cooperation to administer the law faithfully and satisfactorily, at the least possible cost commensurate with good service"

WHAT THE DOCTOR WANTS

By MORRIS ROSENTHAL, M D, NEW YORK, N Y

Dr Morris Rosenthal of New York, member of the committee on Medical Economics of the Medical Society of the State of New York, made an analysis of the basic elements concerned in the administration of the Workmen's Compensation Law, and said

"The Workmen's Compensation Law is primarily an instrument to safeguard the employee

in his comparatively defenseless and dependent situation, and was not intended to earn money for insurance companies, nor to add to the doctor's income But, whatever its original purpose, it has inevitably become an important money-making feature of the industrial scheme, it has added to the amount of professional labor the doctor is called upon to do, and it has added immensely to the combined professional income For these reasons, it has become a problem involving the destinies of employees, employers, carriers, and doctors alike

"The employer is primarily concerned with the usefulness of the employee as a worker Any added provision the employer made for the employee in the way of education or comfort was for the purpose of making the worker more useful to him There may be individual employers whose acts are motivated by a higher idealism who have a humanitarian as well as a commercial conception of their power, but on the whole, the employer, to use his own locution, 'is not in business for his health' He pays for labor, and he wants full value for his money

"The great majority of improvements that have come about in the working life of the employee, have been the result of labor-union pressure upon the employer, or, when they have been initiated by him, it was because they made for greater efficiency of the worker, who was thus enabled to produce greater profits for the employer There have been individual exceptions, based upon outstandingly and rarely idealistic concepts in the employer

"Now, as to the insurance carriers, their own spokesmen will not pretend that insurance companies are in the business for anything but the making of profits Company shareholders are concerned primarily with the annual balance sheet, and not at all with a code of ethics beyond the getting of business and the making of profits And here, too, it is sheer ignorance to imagine that insurance companies will employ any instrument, from the humblest office girl to the industrial surgeon that will not reflect itself favorably on the annual balance sheet Naturally, they will make it their efficient business to get the best office girl for the least money, and the best surgeon obtainable for the least money

"And now for the third element in this industrial tangle, the doctor He is the most elusive factor in the situation, the most difficult to adjudge and the most difficult to adjust His professional contacts are based upon the conviction that everybody knows the traditions upon which he rests, and which invest him with a do-not-touch-me quality These traditions embrace a heritage of service, of sacrifice, of achievement and of humanitarianism They also embrace a traditional disregard for uninformed public opinion, which consistently over-estimates the doctor in some directions, and under-estimates him in others, unless it remains in complete ignorance of what he stands for But whatever the attitude of the public may be toward the doctor, it carries an emotional content which the doctor has utilized in one way or another He has also made sound and effective therapeutic use of this emotional element which has at times carried him to idealistic heights rather beyond the reach of men in other walks of life Not only has the individual doctor been a rather more than average decent human being, but he has been upheld by the code of ethics of his group as well Incidentally, one may as well stress at this point one of the provisions of that code Provision 5 of the code states that, 'a physician, as a member of a liberal profession, should found his expectations of employment on his professional attainments and character, and not on methods resorted to in trade'

"It will be readily seen that a code of ethics that aims deliberately to make the doctor unworldly and uncommercial, in a world whose very structure is based upon exactly contrary principles, is going to create in this problem of industrial medicine, its own special difficulties So much for underlying attitudes

"These are some of the charges brought against the profession by the insurance carriers

"1 That the average general practitioner is not equipped to do compensation work

"2 That, by his incompetence, he causes loss to the employers by prolonging the period of incapacity of injured employees

"3 That he overcharges and deliberately prolongs treatment to run up a big bill"

"It is debatable which attitude is the more damaging to the patient,—that of the doctor, who, while he may not have had special compensation training, has yet the traditional sense of responsibility for his patient, or that of the carrier, to whom, to quote Professor Rogers, 'the consideration of reasonable bills is much more important than efficient treatment' It is debatable whether such evils as money losses to insurance companies are more or less far-reaching than the evil of destroying the confidence of the public in the doctor

"The doctor maintains that, to discredit the profession, even if only by implication, is an evil whose reverberations no man can foretell A doctor's usefulness to his patient is not limited to the application of his technical knowledge. It is because he personifies and symbolizes for the patient strength and dependability and help in time of trouble that he is more useful to him. To lift a case from a doctor is, by inference, and perhaps not by inference alone, to plant in the patient's mind a distrust that may easily extend to the whole profession

"Is it not possible to introduce into the medical schools courses in compensation surgery for

students, and similar courses into the post graduate schools for practicing physicians, so that medical men generally may get this training? One must leave to the surgeons the detailed working out of some such plan as this, but if there is a sufficient number of qualified men, is there any reason why the workman should not be permitted a free choice of physicians? That, with the modification as to training, is one thing that the doctor wants

"There are then two things that the doctor wants

"1 That he be able to qualify himself, if he so desires, to do compensation work

"2 That the workman be allowed a free choice of physicians so qualified

"Given the desire to cooperate, constructive ways of meeting and overcoming the evils that have resulted from the practical working out of the Workmen's Compensation Law may be found But the desire must be there, and that will only come of the ability to evaluate psychologically the present chaos, and the vision to forestall further disaster in the future"

A COMPENSATION BUREAU—COLLECTING FOR MEDICAL SERVICE

By W WARREN BRITT, M D, TONAWANDA, N Y

Dr W Warren Britt, Chairman of the Committee on Medical Economics of the Medical Society of the State of New York, made some practical suggestions based on his four years of experience as chairman of the Committee on Economics of the Medical Society of the State of New York He reviewed the work which his committee had done through the Compensation Conference which was described in this JOURNAL of March 1, 1928, page 276, and the legislation which was proposed for the connection of defects in the administration of the medical part of the Workmen's Compensation Law Dr Britt offered three conclusions

"First Organized medicine recognizes that there are many defects in the working of the Workmen's Compensation Law, both within and outside of the medical profession, but it is unwilling to assume responsibility for these defects unless it is officially recognized in an at least advisory capacity

"Second We approve, and steps have been taken to provide post graduate courses in any County Society that so desires—post graduate courses in workmen's compensation technique and treatment This work will be fostered by the Medical Education Committee of the State Society, and steps are already taken and being provided to furnish such a course for any County Society that will take it

"My third proposition is this If it is true that insurance adjusters have saved insurance companies $800,000 per year by reducing the bills rendered by physicians, I say, if that is true, would it not be a logical business proposition for the Medical Society of the State of New York to maintain a Workmen's Compensation Reference Bureau, with a capable executive, a full-time executive, such a man as the American Telephone and Telegraph Company might employ, or some other large industry? Do we not need some advice from a trained executive to help solve some of our physical problems?

"It is too much for this State Society to ask any man who depends on his practice for his living to give us days and weeks of his time helping to solve these problems It would be far better to employ an able executive who could do this work or assist in this work under our direction much better than we can do it"

GENERAL DISCUSSION

The program was closed by a general discussion by seventeen doctors representing nearly all medical groups interested in Workmen's Compensation, from those having only two or three cases a year to those handling over four thousand annually One doctor represented a manufacturer, two represented insurance companies, two were from the State Department of Labor, one did a consulting practice, while eleven were physicians in private practice In general the six physicians connected with the manufacturers, the insurance companies, and the State Department of Labor defended the administration of the Workmen's Compensation Law, while the eleven in private practice criticized it adversely

Five physicians resented the statement that any doctor could be incompetent to treat injured workmen, and one resented the suggestion that a graduate course of instruction in traumatic surgery should be offered by the Medical Society of the State of New York

The principle of free choice of physicians was

in his comparatively defenseless and dependent situation, and was not intended to earn money for insurance companies, nor to add to the doctor's income But, whatever its original purpose, it has inevitably become an important money-making feature of the industrial scheme, it has added to the amount of professional labor the doctor is called upon to do, and it has added immensely to the combined professional income For these reasons, it has become a problem involving the destinies of employees, employers, carriers, and doctors alike

"The employer is primarily concerned with the usefulness of the employee as a worker Any added provision the employer made for the employee in the way of education or comfort was for the purpose of making the worker more useful to him There may be individual employers whose acts are motivated by a higher idealism who have a humanitarian as well as a commercial conception of their power, but on the whole, the employer, to use his own locution, 'is not in business for his health' He pays for labor, and he wants full value for his money

"The great majority of improvements that have come about in the working life of the employee, have been the result of labor-union pressure upon the employer, or, when they have been initiated by him, it was because they made for greater efficiency of the worker, who was thus enabled to produce greater profits for the employer There have been individual exceptions, based upon outstandingly and rarely idealistic concepts in the employer

"Now, as to the insurance carriers, their own spokesmen will not pretend that insurance companies are in the business for anything but the making of profits Company shareholders are concerned primarily with the annual balance sheet, and not at all with a code of ethics beyond the getting of business and the making of profits And here, too, it is sheer ignorance to imagine that insurance companies will employ any instrument, from the humblest office girl to the industrial surgeon that will not reflect itself favorably on the annual balance sheet Naturally, they will make it their efficient business to get the best office girl for the least money, and the best surgeon obtainable for the least money

"And now for the third element in this industrial tangle, the doctor He is the most elusive factor in the situation, the most difficult to adjudge and the most difficult to adjust His professional contacts are based upon the conviction that everybody knows the traditions upon which he rests, and which invest him with a do-not-touch-me quality These traditions embrace a heritage of service, of sacrifice, of achievement and of humanitarianism They also embrace a traditional disregard for uninformed public opinion, which consistently over-estimates the doctor in some directions, and under-estimates him in others, unless it remains in complete ignorance of what he stands for But whatever the attitude of the public may be toward the doctor, it carries an emotional content which the doctor has utilized in one way or another He has also made sound and effective therapeutic use of this emotional element which has at times carried him to idealistic heights rather beyond the reach of men in other walks of life Not only has the individual doctor been a rather more than average decent human being, but he has been upheld by the code of ethics of his group as well Incidentally, one may as well stress at this point one of the provisions of that code Provision 5 of the code states that, 'a physician, as a member of a liberal profession, should found his expectations of employment on his professional attainments and character, and not on methods resorted to in trade'

"It will be readily seen that a code of ethics that aims deliberately to make the doctor unworldly and uncommercial, in a world whose very structure is based upon exactly contrary principles, is going to create in this problem of industrial medicine, its own special difficulties So much for underlying attitudes

"These are some of the charges brought against the profession by the insurance carriers

"1 That the average general practitioner is not equipped to do compensation work

"2 That, by his incompetence, he causes loss to the employers by prolonging the period of incapacity of injured employees

"3 That he overcharges and deliberately prolongs treatment to run up a big bill"

"It is debatable which attitude is the more damaging to the patient,—that of the doctor, who, while he may not have had special compensation training, has yet the traditional sense of responsibility for his patient, or that of the carrier, to whom, to quote Professor Rogers, 'the consideration of reasonable bills is much more important than efficient treatment' It is debatable whether such evils as money losses to insurance companies are more or less far-reaching than the evil of destroying the confidence of the public in the doctor

"The doctor maintains that, to discredit the profession, even if only by implication, is an evil whose reverberations no man can foretell A doctor's usefulness to his patient is not limited to the application of his technical knowledge It is because he personifies and symbolizes for the patient strength and dependability and help in time of trouble that he is more useful to him To lift a case from a doctor is, by inference, and perhaps not by inference alone, to plant in the patient's mind a distrust that may easily extend to the whole profession

"Is it not possible to introduce into the medical schools courses in compensation surgery for

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5056

The Medical Society of the State of New York is not responsible for views or statements outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

Next Annual Meeting in Utica, June 3-6, 1929

For list of officers of County Medical Societies, see this issue, advertising page xxxii

SCHEDULES OF PUBLICATION

This issue of the JOURNAL contains 96 pages, of which 38 are devoted to advertisements, 9 to the program and plan of the annual meeting, and 30 to scientific articles It is probable that some of the future issues will also consist of 96 pages, for the Editors and Publication Committee plan to complete the publication of all the 1928 State Meeting papers before the meeting of this year

Any schedule of publication is subject to unexpected changes For example, the report of the forum on Workmen's Compensation conducted by the New York County Medical Society constituted a complete review of the subject, and it is therefore published on page 456 of this issue Another forum was on the subject of the relation of physicians to lay health organizations, and it too will be printed in the near future.

unanimously upheld, although there was a division over the question of permitting the State Department of Labor and the insurance companies to have consultants examine the cases

Examples of padded bills and excessive charges were given by the physicians of the insurance companies and manufacturers, and the practice of lifting cases from family physicians was both condemned and upheld

Situations sometimes developed which were both embarrassing and amusing For example, a physician employed by an insurance company told of a case of broken arm that slept in a hospital but went home during the day To demands of "name the hospital," the doctor finally said that it was in New Jersey

Dr Raphael Lewy, Chief Medical Examiner of the State Department of Labor, defended the need of expert consultants in a large proportion of traumatic cases He was racy and at times radical In closing he said

"If you want to stop all the argument on the entire question, and I made this statement over twelve years ago, if the foundation of this law is really and honestly meant for the welfare of the workmen, then from the moment that the individual is injured, or from the moment he is disabled in consequence of vocational illness, he is part of the State He should be placed in a State hospital He should be treated by State physicians He should be operated on by State surgeons His case should be consulted by State consultants, and there will be no argument, and the insurance must be State insurance, and then every case will be compensable, and every case will be paid for

"My suggestion is actually based upon a logical possibility Possibly it is not so easy to carry out as I tell it to you, but I say, it can be carried out, and if it could be carried out, it would be carried out This thing would be absolutely unapproachably perfect.

"Until then, when you are dealing with the claimant, the employer, the insurance carrier, and the State Industrial Commission, it is not easy

"But for you, the important point is this Leaving out all the argument this evening, disassociating yourself from everything, all you want is this The individual workman shall have a right to select his own physician, and that physician should have a right to treat that case until it is legitimately finished That you do want I endorse it at this moment, too"

Dr Archer made the following announcement

"To make something constructive out of this meeting, I desire to inform you that the Medical Department of the Aetna Life Insurance Company would be very glad to meet any committee that you might care to send down, or we will meet them at any place that your committee may designate, and let's see if we can't get together and thrash out this thing, and arrive at some decision that will be agreebale to every one"

Chairman Bancroft replied

"In conclusion, I think Dr Archer hit the nail on the head It seems to me, with people all vitally interested, if this committee can get together with certain insurance companies and start the ball rolling, the others will follow"

cially that dealing with the report of Professor Lindsay Rogers who was an independent investigator appointed by the Governor He goes to greater length than the doctors in pointing out instances of stealing cases from doctors and of other illegal acts But he takes the stand that the greater part of the defects in the administration of the law cannot be remedied by legislation, but the remedy consists in elevating the standards of the medical profession His conclusion seems to be that the causes of complaint will be reduced to a minimum when the doctors conform to the standards of practice and procedure required by the State Department of Labor If the doctor does this, the insurance companies will find little ground for disputing his bills

THE ANNUAL MEETING

The Committee in charge of the annual meeting of the Medical Society of the State of New York has made tentative plans for the sessions to be held on June 3-6, in Utica The multiplicity of engagements which burden New York physicians hinder the committees in their work of making up the final program down to its fullest detail However, the main features of the meeting are settled

The afternoon and evening of Monday, June 3, and the morning of Tuesday, June 4, will be devoted to the House of Delegates

General scientific sessions will be held on the afternoons of Tuesday, June 4, and Wednesday, June 5

The eight scientific sections will hold their meetings on the mornings of Wednesday, June 5, and Thursday, June 6

The programs of the scientific meetings are printed on page 474 of this issue of the JOURNAL

Attention is also called to the commercial exhibits, a description of which is found on page 477 and the pages following

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Colonel Gorgas and the Panama Canal The JOURNAL of April, 1904, records the proceedings of several County Medical Associations The record for the Monroe County Association reads

"Dr Bleecker L Hovey, a member of the Legislative Committee of Munroe County and American Medical Association, presented the following preamble and resolution

"Whereas, The United States of America is about to undertake the construction of a ship canal across the Isthmus of Panama, and a commission is about to be appointed for the supervision of the work, and

"Whereas, The experience of recent years has demonstrated the beneficent result to life and health in tropical climates of scientific sanitation under professional supervision, without which the construction of such a canal will be attended with unnecessary loss of life and impairment of health of those engaged in the work,

"Therefore, Resolved, That the Hon Theodore Roosevelt, President of the United States, be and is hereby respectfully petitioned to appoint upon the Panama Commission a representative of the medical profession of such attainments and experience in scientific sanitation as to guarantee appropriate professional supervision thereof, and further

"Resolved, That the name of Col W C Gorgas, a surgeon of the United States Army, be and is hereby respectfully presented as such person

"Colonel Gorgas is a man who is eminently fitted for this position by reason of his long experience in southern climate, and is especially qualified to deal with disease of such climate

"Resolved, That a copy of this resolution be sent to the President of the United States, to each of the United States Senators of the State of New York, and the Representatives in Congress from this district

"On motion, the foregoing preamble and resolution was adopted by the Monroe County Medical Association."

WORKMEN'S COMPENSATION

The medical aspects of the Workmen's Compensation Law are widely discussed among physicians While the administration of the law is generally satisfactory to workmen and employers, to insurance companies and the State, and even to physicians who specialize in compensation cases, yet physicians who see few or no compensation cases are generally dissatisfied, and one reason for their dissatisfaction is their unfamiliarity with the procedure that must be followed in collecting bills

A doctor is not likely to look up the law until the time comes for him to render a bill, and then he is irritated because the Compensation Commission asks him questions which he cannot answer clearly because he is not accustomed to keeping the records or making the reports of the progress of the cases which every public institution requires Hospitals have great difficulty in securing histories from the attending physicians, and the difficulty is even greater with the average physician who treats few compensation cases

The procedure which a doctor must follow in order to be in a position to collect a compensation bill promptly is clearly set forth in this JOURNAL of April 1st, page 395, by Dr J N Vander Veer, president-elect of the Medical Society of the State of New York If doctors would read these requirements and follow them, they would have little difficulty with their bills for compensation cases

The Medical Society of the State of New York considered Workmen's Compensation in a public forum on February 15th, at which speakers discussed all phases of the subject, and of which an extensive abstract is published on page 456 of this issue of the JOURNAL This report presents the opinions of all classes of doctors engaged in compensation work If a doctor reads this abstract in connection with the article by Dr Vander Veer, he will get a comprehensive impression of the relation of physicians to the Workmen's Compensation Law

The reports of the State Department of Labor show that over eight million dollars are paid annually to practising physicians for their treatment of injured workmen who are injured under the Workmen's Compensation Law This amounts to over five hundred dollars for every doctor practising in the State But the cases of injured workmen are not evenly distributed among the physicians Probably ninety-five per cent of the cases are treated by less than ten per cent of the physicians, so that the average income of physicians treating compensation cases is over five thousand dollars These physicians do not seem to be making complaints regarding the administration of the Workmen's Compensation Act, they follow the prescribed rules implicitly and collect their full fees promptly

The largest group of complaints that come to the attention of the Medical Society of the State of New York originate with physicians who treat only occasional cases These physicians often fail to realize the fundamental principles underlying their treatment of an injured workman, and the distinction between cases treated under the law and those in private practice

A doctor treating a compensation case must realize that in addition to the injured person he is accountable to the employer, the State Department of Labor, and the insurance company He must inform each of these three parties of his part in the transaction—and that means that he must attend to at least five details

1 He must report every injury promptly

2 He must get an authorization from an employer to treat the injured person

3 He must keep full records of the case, and submit progress notes from time to time as they may be required by the employer, the insurance company, and the State Department of Labor

4 He must be prepared to go on the witness stand and submit to a cross examination regarding the treatment which he has given and the prognosis which may be expected

5 Since the employer, the insurer and the State are all interested in the injured workman, they have the right to demand that the treatment shall be according to the standards accepted by the best hospitals of New York State This means that a doctor shall seek the help of a consultant in every doubtful case He cannot plead the explanation that the patient is satisfied with his treatment, for many a patient is anxious to live a life of idleness and ease at the expense of the employer or the insurance company The physician is expected to estimate the curability of the condition and to advise the patient to submit to reconstructive measures, or he shall estimate the degree of permanence of the disability, and of the loss of the earning power of the patient These kinds of judgments require a special knowledge which the average doctor does not possess because he has had but little experience on which to base his judgment Hence, the average physician is expected to seek consultation and advice early in the course of the treatment.

Every case which comes under the Workmen's Compensation Act is a State case, and its public aspects must be recognized by the physician The requirements of the State are irksome to the family doctor who considers himself accountable to his patient only If the physician will recognize the public aspects of compensation cases, his dealings with the State Department of Labor will be as satisfactory as those with the State Department of Health

The relation of insurance companies and the employers to physicians has not been entirely satisfactory, as one may readily see by reading the abstract of the New York County forum, espe-

cially that dealing with the report of Professor Lindsay Rogers who was an independent investigator appointed by the Governor He goes to greater length than the doctors in pointing out instances of stealing cases from doctors and of other illegal acts But he takes the stand that the greater part of the defects in the administration of the law cannot be remedied by legislation, but the remedy consists in elevating the standards of the medical profession His conclusion seems to be that the causes of complaint will be reduced to a minimum when the doctors conform to the standards of practice and procedure required by the State Department of Labor If the doctor does this, the insurance companies will find little ground for disputing his bills

which have sufficiently improved to permit surgical intervention, and others which have gone through such intervention (there is no mention of artificial pneumothorax, perhaps because the tuberculosis is presumably bilateral) No particulars of the diet are given in the present article, beyond the withdrawal of salt.—*Munchener medizinische Wochenschrift,* January 4, 1929.

Problems of the Constitution—Professor Julius Bauer deals with the recent reappearance into medical practice of the old theories of constitution, habitus, diathesis, etc It is believed that studies made during the world war on large bodies of troops, prisoners, etc, gave the impetus to this movement Reduced to a formula it amounts to this why do some men escape a given disease altogether, why do some contract it in a mild form, and why do others succumb without a chance? To say that the differences are due to differences in susceptibility and immunity is to utter mere words This brings the whole question down to personal equation without any regard to the possibility of general types It we can divide mankind into somatic types the least we can do is to investigate the relation of these to the various diseases, as has been done by various clinicians with anthropological knowledge, in the past few years The author mentions especially Kretschmer in Europe and Draper in the United States as pioneers and cites his own "status degenerativus" as well as some of the scattered creations of the older clinicians, such as Czerny's exudative diathesis, the status thymico-lymphaticus status hypoplasticus, status asthenicus, etc, etc Endocrine types must stand out as something apart and we must always be prepared to distinguish between the predisposition supplied by the individual and that of the genotype The old doctrines of diathesis were ridiculed out of existence, largely because of the microbian etiology of diseases, and it will be no simple matter to rehabilitate them We can only correlate the habitus of the patient with his morbidity, avoiding all hasty generalization and duplication in nomenclature There must be some agreement as to the criteria of alleged constitutions or habits of body—certain indices used by anthropologists—and if possible only trained and qualified men should make the contributions —*Klinische Wochenschrift,* January 22, 1929

Psychology and Case Histories—G Grund discusses this subject formally from some modern angles, the subject itself being as old as medicine It is possible for the patient to make replies to a questionnaire instituted by the physician in such a way that he tells nothing or tells untruths, and now and then we find a diagnostician who prefers to make his examination first and then tell the patient his past without bothering to ask his side of the case At one period, indeed, the patient's testimony was undervalued throughout, but some clinicians have always insisted that a personal history, if judiciously elicited, is of great value. This belief received a great impetus from the psychological studies of reaction time in replying to questions and from psychoanalysis The author believes that ordinary case history taking should be reformed, a new technique being supplied The memory can be stimulated to recall events, as in psychoanalysis, but the author finds that these latent memory pictures may be complex and not easily resolved, although the very fact that several symptoms are involved simultaneously may throw light on the case The patient's sense of awareness and his ability to recall events are of great value Some patients have a very defective time sense and refer past sensations to the wrong period Doubtless a psychological examination of the patient before taking his history would give us valuable information as to how to conduct the history taking Patients of the introverted type, addicted to self-observation, are predisposed to self-deception, while opposed to this type is one which is largely indifferent to what goes on within the mind When an individual of this type is really taken ill, his sensations may be so novel that he finds it difficult to describe them It is evident that a system of history taking which shall include all of the recent developments of psychology is hardly demanded in the ordinary case, although indispensable in others where diagnosis is obscure or where there is something of special forensic importance—*Münchener medizinische Wochenschrift, January* 11, 1929

Modes of Origin of Diabetes—E Wiechmann asks "how the diabetic gets that way?" Naturally every one knows the ultimate mechanism—the insufficiency of the islets of Langerhans—but how does this insufficiency come to pass? Two main groups of diabetics have been distinguished which are more or less sharply differentiated In the minority group the blood pressure is normal or lowered, while in the larger division it is heightened This subdivision is largely also one of age periods for in the first group the average age is much lower than in the second, the former containing few young people But still more weighty are the differences in the pancreas, for in Group I this organ is mostly normal even under the microscope, while in Group II it is the seat of more or less sclerosis, which is associated often with atherosclerosis of the

MEDICAL PROGRESS

Grippe and Its Prophylaxis—R. von der Velden, discussing the present outbreak in Berlin, writes "grippe epidemic" in quotations as if skeptical as to the diagnosis He writes at great length and concludes that in order to fix the autonomy of influenza an international accord is necessary, suggesting that the League of Nations assume the initiative We do not know enough about these conditions to formulate a rational prophylaxis nor is there a rational treatment—there is a great disagreement about alcohol for example The role of sinus complications is uncertain (the author is silent as to the theory that much clinical influenza is nothing more than an ordinary cold plus sinus infection and lack of drainage) In discussing the epidemiology the author is also silent as to the claims of adherents of the old air-borne theory which is again cropping out Even the long world history of the disease has its opponents, as the author does not believe there is any certain evidence of a pandemic before 1510 No other affection has ever shown such extremes of mild and malignant incidence In most countries there seem to have been endemic foci, the country at large remaining immune for decades Thus the disease was endemic in Minnesota long before the pandemic of 1890

In the same number of this journal is an article by P Schmidt on the prophylaxis of grippe, and in this article also the author is somewhat skeptical If the malignant type is rampant we must of course make use of the most drastic of measures against contagion Schmidt, who is at the head of the Hygienic Institute at Halle, is evidently a near-believer in the Pfeiffer influenza bacillus as the cause of true influenza and would be guarded largely by what is known of this organism He states that it can pass to some extent (15 per cent) through the porcelain filter, that it is at its maximum virulence in the first few days of the disease, that it has been made to transmit the disease from person to person experimentally, etc—*Deutsche medizinische Wochenschrift,* January 25, 1929

Finikoff's Method in the Treatment of Surgical Tuberculosis—A Aimes refers to the original paper by A Finikoff in the *Revue de Chirurgie,* No 5 1927, which details a method of treating local tuberculosis with peanut oil to stimulate the production of lymphocytosis and lipase formation in the blood, plus iodine as a stimulant of leucocytosis and as an antibacillary remedy, and finally the salts of calcium The iodine, in a concentration of 1 part to 10 in the oil, is injected intramuscularly once a week and but for one circumstance no calcium salts would be indicated Between the oil and iodine the envelope of the bacilli is dissolved and the organisms fall a prey to the leucocytes, but at the same time fatty acids are set free and would cause an acidosis if not neutralized by the lime salts—in fact the acids without this neutralization exert a decalcifying action on the system The present article is brief and refers chiefly to cases of adenitis, tuberculous ulcers, osteoarthritis, and tuberculous rheumatism socalled The results were mostly good although not startling Enlarged lymphnodes were always reduced in volume and occasionally completely so, although time was required and other resources were sometimes employed The cases of osteoarthritis were of a severe type but the new treatment seems to have prevailed in 3 out of 4, in the fourth case the author believes that he saved a limb from amputation although the white swelling of the knee was but little influenced The results on the whole do not seem superior to those reported by Rollier and others with heliotherapy and ordinary surgical management, but the treatment may prove of value as a synergist and is easy to supervise—*Le Progrès Médical,* January 12, 1929

Salt Free Diet in Tuberculosis—G Baer, A Herrmannsdorfer, and H Kausch refer to an attempt made in 1925 by Sauerbruch and others to establish a special diet for the tuberculous Although this plan aroused much opposition the course of time seems to have shown its justification The good reports apply not only to pulmonary tuberculosis but to surgical forms and to lupus and other tuberculides—in this latter group the writer says that results have been nothing less than startling In the present paper the authors deal with a hundred cases of pulmonary tuberculosis extending over 3½ years The principles underlying the diet comprise salt privation, transmineralization, acidosis, vitamins, etc. It is difficult to carry out a strict regimen in pulmonary tuberculosis and also to check up on benefit, and the authors have made use of serial rontgen plates in the latter connection. There is no intention of limiting treatment to diet and all useful remedial procedures are employed Four quite distinct types of the disease are isolated, viz, the febrile exudative form with severe general participation, the fibroid form with fresh exacerbations, cases

Kaiser found the test positive in 75 per cent of the cases In a group of 30 patients with rheumatism and heart involvement the writer found the test positive only about half as often In going through the histories of these patients he found that 12 who had been receiving large doses of salicylates reacted negatively It was also noted that cases showing a definite history of rheumatic infection some years previously, but with no evidence of recurrence of recent date, frequently were also negative to the test In this respect it would seem to be different from the tuberculin test, in which, once there has been infection, the allergic phenomenon of a specific nature persists If a positive reaction, on the other hand, indicated susceptibility to infection with the streptococcus isolated from rheumatic fever its clinical usefulness could be easily understood Kaiser felt that it did not indicate susceptibility, because of its being positive in the presence of and persisting after acute rheumatism However, it is known that rheumatism does not produce immunity and one would not expect it to act as does scarlet fever or diphtheria with the Dick or Schick tests A large percentage of positive reactions were present in children who had had chorea This might be accounted for by the fact that these children had not had large doses of salicylates In a small group having no evidence of rheumatism only one gave a positive reaction A family history of rheumatism seemed to have very little relation to the reactions Further study is needed to determine the exact significance of this test and the factors which influence it —*Canadian Medical Association Journal*, February, 1929, xx, 2

The Combined Hypoglycemic Action of Insulin and Sodium Borate —Drs M Loeper, Ravier, and Tonnet contribute a brief article on this subject It has been known since 1926 that sodium borate has a hypoglycemic action, which while slight in health is quite pronounced in disease (although far from constantly present) A series of experiments has shown that this action is due to the boron radicle and not at all to the sodium The authors have now made comparative tests of straight insulin and insulin plus the borate on four diabetic patients In two patients the combination was seen to be superior to plain insulin, while in a third the action was the same and in the fourth the plain insulin was slightly superior On the whole it may be worth while to make further trials of the combined treatment The rationale of the new method is obscure, but we know that in the case of certain salts of cobalt and nickel combined with insulin positive results have also been obtained It is probable that these salts exert their activity directly on the liver or pancreas, although the action may be only symptomatic—thus the action could be exerted on the kidneys, nervous system, etc However, if the reader studies the table published by the authors, he will fail to feel quite the same enthusiasm over the figures The material is very small and the results from insulin alone do not seem to be notably inferior to those from the combination The variation seen in simple insulin treatment is sufficiently great to throw doubt on the role of the borate in these cases —*Le Progres Médical*, February 2, 1929

The Prevention of Gallstones —E Stanley Ryerson points to the fact that gallstones are formed of a series of laminated layers of various substances, chief of which are cholesterol, bile pigment salts, and calcium The laminated character of the stones may be explained by periods of high blood cholesterol, and the life history of the patient may show mild attacks of cholecystitis It seems probable that there is a combination of infection and biological change going on at the same time, and often the latter is the chief factor It is known that the blood cholesterol is increased during pregnancy and gallstones are of frequent occurrence in women who have borne children Medical men should therefore be on the look-out for any indication suggesting cholecystitis between the ages of eighteen and forty-five Formerly mild attacks of cholitis were too often diagnosed as "acute indigestion" or 'bilious attacks" If an early cholecystitis is diagnosed, advice should be given which will help to reduce the amount of cholesterol in the system The chief means of accomplishing this is by eliminating from the diet such articles of food as the yolks of eggs, cream, liver, brains, and animal fat The quantity of food taken should be such that no increase in weight occurs The tendency to biliary stasis should be prevented by breathing exercises, engaging in some sport or walking, and by taking magnesium sulphate on rising in the morning, graduating the dose so that diarrhea is not produced The prevention of biliary stasis will reduce the chances of infection Hurst has recently shown that the administration of urotropin and alkalis produces satisfactory results in cholecystitis The patient is given two mixtures to be taken together after breakfast, after tea, and 10 p m , a glass of milk being drunk after the last dose to prevent gastric irritation The first mixture consists of a drachm each of sodium bicarbonate and potassium citrate in an ounce of water, and the second of 100 grains of urotropin in an ounce of water The first day an ounce of the alkaline mixture is taken with half an ounce of the urotropine mixture, the latter is increased by a drachm each day until a full ounce is taken The double mixture is then taken daily for several months, occasionally interrupting the urotropine for a few days, after which the dose is again gradually raised from 50 to 100 grains —*Canadian Medical Association Journal*, February, 1929, xx, 2

vessels of the gland Of the various criteria which distinguish the two groups the most importance is attached to the blood pressure The author has studied especially the state of glycolysis in victims of hypertension, both essential and symptomatic He found an undoubted relationship between this condition and anomalies of sugar metabolism, but the kind of hypertension cut no figure—any hypertonic, he says, is a latent diabetic He therefore assumes that the islets are involved through their blood vessels In the other group of young persons without rise of blood pressure, we can best assume an hereditary insufficiency of the islets with a strong family taint of gout, obesity, or other metabolic anomaly However, over and above these two groups, there are a number of minor etiological groups, such as the syphilitic, the traumatic, the post-infectious, etc , in which the pancreas may be the seat of special lesions There is a type secondary to gallstone disease in which the process has extended to the pancreas, and the author devotes much space to its discussion —*Munchener medizinische Wochenschrift,* January 18, 1929

The Insulin Fattening Cure and Hyperthyroidism.—F Hogler, assistant to Professor W Falta of Vienna, contributes a brief article on this subject It will be recalled that Falta was the first to employ insulin in forms of emaciation and that numerous brilliant results were reported although it soon became necessary to select carefully the cases for treatment Negative results are obtained in cachexias of all kinds, in febrile patients, and in some other groups Hitherto no detrimental by-action has been noted, but now the author has placed on record two cases in which a hyperthyroid syndrome developed while the subjects were under the insulin treatment for emaciation Before resort to insulin the author always makes trial of the sugar fattening treatment and when this fails proceeds with the insulin The first patient was a woman of 35 in whom the hyperthyroid syndrome appeared in such a burdensome degree that the insulin was discontinued The basal metabolism was found to have risen by 33 per cent and no weight was taken on The hyperthyroid symptoms subsided spontaneously The second case was in a man of 26 At the outset the basal metabolism was found to be subnormal The first insulin course had to be suspended because of an intercurrent attack of angina The second course caused an increase of basal metabolism, with hardly any gain in weight, and the development of hyperthyroidism The administration of insulin was again broken off, and the hyperthyroid symptoms subsided spontaneously, and the basal metabolism again became subnormal Finally the patient put on a few pounds after a two weeks' course of arsenic Apparently there is an erethistic type of lean subject in which the use of insulin can produce hyperthyroidism like thyroxin itself, in other words, it activates the thyroid to increased hormone production These results may be predicted, it would appear, if there is initial subnormal basal metabolism —*Klinische Wochenschrift,* January 29, 1929

The Treatment of Arthritis, Rheumatism, and Neuritis with Chemotherapy and Physiotherapy.—Walter M Bartlett and E Suneson, writing in the *New England Journal of Medicine,* February 21, 1929, cc, 8, emphasize the fact that in dealing with infectious arthritis, rheumatism, and neuritis the first important duty of the physician is to find and eradicate infectious foci They think it is not too early to predict that the disease will eventually be conquered by chemotherapy Ammonium ortho-iodoxy-benzoate, when given in large enough doses intravenously, can be depended upon to relieve pain and muscle spasm in the majority of cases and thereby gives opportunity for securing marked improvement through physiotherapy Massage and medical gymnastics play a large part in the treatment of arthritis Diathermy and electrotherapy are helpful in certain cases, but in advanced arthritis nothing can take the place of deep muscle massage and active and passive exercises In the presence of septic fever or during the most active stages of toxic arthritis, exercise is contraindicated, but as soon as conditions permit it should be started Deep and vigorous muscle massage is applied daily to all muscle groups to prevent atrophy and spasm due to prolonged inactivity Massage over the joints themselves is not advisable Active motion of joints, in spite of pain and muscle spasm, should be insisted upon Effleurage is always given at the beginning and end of a treatment to improve the circulation and promote absorption The authors tabulate the clinical results in eighteen cases to show the favorable effects of combined chemotherapy and physiotherapy in arthritis and neuritis

Results with Birkhaug's Rheumatic Toxin.—Following the report of Albert D Kaiser on his studies in skin reactions with the toxic filtrate produced by a non-methemoglobin-forming streptococcus isolated from rheumatic fever, A P Hart undertook studies with the same toxin in children, using that supplied by Konrad E Birkhaug The test is made in the same manner as the Schick or Dick test, by injecting 0 1 c c of a 1 in 100 dilution of the toxin The results are read in twenty-four hours A positive reaction is similar to that in a positive Dick test In children having chorea and rheumatic fever

Kaiser found the test positive in 75 per cent of the cases In a group of 30 patients with rheumatism and heart involvement the writer found the test positive only about half as often In going through the histories of these patients he found that 12 who had been receiving large doses of salicylates reacted negatively It was also noted that cases showing a definite history of rheumatic infection some years previously, but with no evidence of recurrence of recent date, frequently were also negative to the test In this respect it would seem to be different from the tuberculin test, in which, once there has been infection, the allergic phenomenon of a specific nature persists If a positive reaction, on the other hand, indicated susceptibility to infection with the streptococcus isolated from rheumatic fever its clinical usefulness could be easily understood Kaiser felt that it did not indicate susceptibility, because of its being positive in the presence of and persisting after acute rheumatism However, it is known that rheumatism does not produce immunity and one would not expect it to act as does scarlet fever or diphtheria with the Dick or Schick tests A large percentage of positive reactions were present in children who had had chorea This might be accounted for by the fact that these children had not had large doses of salicylates In a small group having no evidence of rheumatism only one gave a positive reaction A family history of rheumatism seemed to have very little relation to the reactions Further study is needed to determine the exact significance of this test and the factors which influence it—*Canadian Medical Association Journal*, February, 1929, xx, 2

The Combined Hypoglycemic Action of Insulin and Sodium Borate—Drs M Loeper, Ravier, and Tonnet contribute a brief article on this subject It has been known since 1926 that sodium borate has a hypoglycemic action, which while slight in health is quite pronounced in disease (although far from constantly present) A series of experiments has shown that this action is due to the boron radicle and not at all to the sodium The authors have now made comparative tests of straight insulin and insulin plus the borate on four diabetic patients In two patients the combination was seen to be superior to plain insulin, while in a third the action was the same and in the fourth the plain insulin was slightly superior On the whole it may be worth while to make further trials of the combined treatment The rationale of the new method is obscure, but we know that in the case of certain salts of cobalt and nickel combined with insulin positive results have also been obtained It is probable that these salts exert their activity directly on the liver or pancreas, although the action may be only symptomatic—thus the action could be exerted on the kidneys, nervous system, etc However, if the reader studies the table published by the authors, he will fail to feel quite the same enthusiasm over the figures The material is very small and the results from insulin alone do not seem to be notably inferior to those from the combination The variation seen in simple insulin treatment is sufficiently great to throw doubt on the role of the borate in these cases—*Le Progres Médical*, February 2, 1929

The Prevention of Gallstones—E Stanley Ryerson points to the fact that gallstones are formed of a series of laminated layers of various substances, chief of which are cholesterol, bile pigment salts, and calcium The laminated character of the stones may be explained by periods of high blood cholesterol, and the life history of the patient may show mild attacks of cholecystitis It seems probable that there is a combination of infection and biological change going on at the same time, and often the latter is the chief factor It is known that the blood cholesterol is increased during pregnancy and gallstones are of frequent occurrence in women who have borne children Medical men should therefore be on the look-out for any indication suggesting cholecystitis between the ages of eighteen and forty-five Formerly mild attacks of cholitis were too often diagnosed as "acute indigestion" or "bilious attacks" If an early cholecystitis is diagnosed, advice should be given which will help to reduce the amount of cholesterol in the system The chief means of accomplishing this is by eliminating from the diet such articles of food as the yolks of eggs, cream, liver, brains, and animal fat The quantity of food taken should be such that no increase in weight occurs The tendency to biliary stasis should be prevented by breathing exercises, engaging in some sport or walking, and by taking magnesium sulphate on rising in the morning, graduating the dose so that diarrhea is not produced The prevention of biliary stasis will reduce the chances of infection Hurst has recently shown that the administration of urotropin and alkalis produces satisfactory results in cholecystitis The patient is given two mixtures to be taken together after breakfast, after tea, and 10 p m, a glass of milk being drunk after the last dose to prevent gastric irritation The first mixture consists of a drachm each of sodium bicarbonate and potassium citrate in an ounce of water, and the second of 100 grains of urotropin in an ounce of water The first day an ounce of the alkaline mixture is taken with half an ounce of the urotropine mixture, the latter is increased by a drachm each day until a full ounce is taken The double mixture is then taken daily for several months, occasionally interrupting the urotropine for a few days, after which the dose is again gradually raised from 50 to 100 grains—*Canadian Medical Association Journal*, February, 1929, xx, 2

LEGAL

By Lloyd Paul Stryker, Esq.
Counsel, Medical Society of the State of New York

COLLECTING FROM CLINIC PATIENTS ABLE TO PAY

One of the grave economic problems confronting the medical profession is the increasing number of persons who, though financially able to pay a reasonable compensation for medical services rendered, nevertheless by fraud, misrepresentation or otherwise take advantage of the service rendered by the clinics and hospitals of this state to those who are not financially able to pay for the same

A very interesting case involving the rights of physicians to recover for services rendered to a clinic patient where it subsequently was established that he was financially able to pay for such services, was recently decided in this state This decision is of great interest to the profession generally and therefore, we shall detail the facts at some length

An elderly man presented himself for examination and treatment at the out-patient department of a clinic in a public hospital He was examined by two physicians who advised him that he would have to undergo a surgical operation The man did not consent to this operation, but continued to be treated by these two physicians for a period of over six months Then his condition became such that he was forced to enter the hospital for the operation At no time did he disclose to anyone in the hospital that he was financially able to pay the reasonable value of the services rendered to him both by the physicians and the hospital It was conceded "that he obtained admission to both departments (of the hospital) for the purpose of obtaining both medical and surgical services without charge, and that he had no expectation or intention of paying for the medical and surgical services which were rendered him Whether he secured that service by fraud, or rather, through mistake; the fact remains that, in one way or another, the benefit he received was more than he paid for" When the patient finally consented to the operation in question, he was admitted to the in-patient service as a charity patient and the two physicians in question performed an operation upon him and rendered post operative treatment. He had no financial arrangement with these physicians with respect to the operation, but he did agree with the hospital to pay and did pay the usual though inadequate fixed charge in such cases for room, nursing and post operative care About a month after the operation the patient died and then it became known for the first time that he was worth nearly half a million dollars Upon ascertaining this fact the two physicians who had treated and operated upon this patient very properly asserted a very modest claim against the patient's estate Two questions were presented to the court for decision First, did the physicians in question have a legal claim against the estate and second, whether evidence of the patient's financial standing could be considered in determining the reasonable value of the services rendered. In holding that the physicians had a legal claim against the patient's estate, the court said

"Relying upon the patient's classification as an out-patient, the staff surgeons performed the operation without intention of charging therefor and without any expectation of any recompense from the patient. Personally, these surgeons had no direct contractual relation with the patient. They did not even mistakenly suppose there was any such relation existing They were, in no sense, taking a chance he might some day become able to, or would manage to pay them. They were discharging their own duty to the hospital, and, as it happened, on one mistakenly supposed to be a charity patient * * *

Had these claimant surgeons known this patient was well able to pay, they would have had the right, both professionally and under their arrangement with the hospital in joining its staff, to refuse to treat him gratuitously So, between this patient and the hospital, there was an express contract, and it included part, but by reason of mistake or accident, not all of the service which he received through the hospital from its staff He knowingly accepted this service under the mistaken idea he would not have to pay for anything more than he was asked to pay for Not in fact a pauper, he was only mistakenly classified as such By reason of this mistake—whether due wholly to himself, or in part chargeable to the admitting clerk, does not matter—these claimant surgeons were induced to render him valuable services which they would, probably, not have done had they known the real state of the case. It was not for them to investigate the financial status of the patient They had the right to rely on his classification by the admitting clerk, * * *

I am of the opinion that in equity and good conscience his executors should recompense them * * *"

In holding that the financial ability of the patient was an element which should be taken into

consideration in fixing the reasonable charge of a physician, the court said

"In measuring the value of a lawyer's services, the prominence of his clients can be taken into account An equal, and probably a greater, social bearing is attributed to medical service In order that such skill may be highly developed and well paid, and that the greatest number and the group itself served thereby, it is recognized as a social necessity that those who are quite able to pay, especially, for the best, should pay adequately and liberally, in any case, to avoid the social danger incurred either in allowing those less able or unable to pay, to go about the community in a diseased, untreated condition, or in allowing the skill and equipment of competent medical men to be lessened, or lost to the locality, by inadequate over-all recompense * * *

"From the social point of view, it is immaterial whether the wealthy recipient of medical service is, or is not, unconscious at the time the physician is called, or is in attendance For the same reason, such a person obtaining such sersame reason, such a person obtaining such service in the manner in which this decedent did, is

"Neither of them has any social right to expect such service from such men at the same rate, the inadequate rate, at which it is received by those who have less successfully made use of the opportunity that society affords, or who happen to be forced to avail themselves of the protection of the individual that accrues from the duty of the group to protect itself as a group"

It was therefore, held that the physicians were entitled to recompense from the estate of the patient for the full amount of the claims presented by them

Every principle of equity and justice and every rule of logic is in favor of the decision here made The court recognizes that the practitioners of the great healing art give unsparingly, with no thought of compensation, of their time to alleviate human pain and suffering But the decision also recognizes that physicians are not excluded from the maxim that the laborer is worthy of his hire, and that those who are possessed of adequate financial means should not be permitted to take advantage of the charity which physicians are only too willing to accord to those who cannot pay for their services

The physicians who presented these claims and were successful in having the court recognize them, have done a signal service to their professional brethren by serving notice upon those who, with ample means to pay, would nevertheless seek to secure the professional services of physicians without compensation

---

CLAIMED NEGLIGENCE IN DELIVERY

In this case the husband of a woman called the doctor to his home, stating that his wife was about to give birth to a child The doctor had seen the woman several weeks before, and at that time had examined her urine and made a general physical examination Upon calling at the house, the doctor found the woman in labor, and an examination disclosed that the head was in the occiput posterior position, which necessitated a rotation of the head Forceps were applied, and without any difficulty the child was delivered in perfect condition The doctor had called in a competent anesthetist who assisted him in the delivery Drops were placed in the child's eyes, the placenta was delivered, and the doctor ascertained that the mother had suffered no lacerations, nor was there any danger of a post-partum hemorrhage When this had been done, he and the anesthetist left the house

He called each day for the next three days, and found the mother and child in good condition. A few days thereafter he was called in by the husband because of a watery exudation from the child's cord The doctor made an examination, but found no infection causing the discharge of pus He told the mother to use some boric acid powder in the region of the cord, and advise him in the course of a day or so if there was not perfect healing At this time there was no observable protrusion of the umbilicus, nor was there any in the inguinal region The eyes did not show any discharge or redness at that time

The doctor never heard from the patient again until he was served with a summons and complaint, in which complaint it was charged that the defendant doctor had so carelessly delivered the plaintiff's wife as to cause the following injuries to the child A navel rupture, a rupture to her right side, and swollen festered eyes It was also charged that the defendant was negligent in treating these injuries No action was brought by the mother or father on behalf of the child The sole action was by the husband

The plaintiff's attorney, evidently realizing his case was wholly without merit, finally discontinued, thus terminating the action in the doctor's favor

CLAIMED NEGLIGENCE IN THE PERFORMANCE OF TONSILLECTOMY

The plaintiff, a young woman, charged the defendant with negligence in the performance of a tonsillectomy Her claim was that she developed bronchitis after the operation, and that the doctor was responsible for it

When she first called at the doctor's office she complained of dizziness Upon examination the doctor found her tonsils and adenoids enlarged and diseased The doctor injected a solution of arsenic and iron into her arm twice a week for three weeks, and gave her Huxley No 1 Adreno pitutary tablets to take internally The doctor then decided to remove her tonsils and adenoids He had an x-ray taken of the plaintiff's chest which showed both apices clear, slight peri-bronchial thickening, and several quiescent tubercles The doctor removed her tonsils and adenoids under a general anesthesia at the St Elizabeth's hospital The patient remained in the hospital two days and made an uneventful recovery

About ten days after she left the hospital, the doctor was called to the patient's home and upon examination found that she had bronchitis on both sides He prescribed a cough mixture and tablets of creosote Several days later the doctor again called on the patient and found her in bed improved He advised her to continue taking the medicine he had prescribed When he called a week later the parents of the girl refused to let him see her, and said that another physician was handling the case The doctor did not see the patient again for several months, and one day she came to his office and demanded that he give her the x-ray pictures which he had taken The doctor told her that he would be very glad to give her the X-ray pictures but he could not locate them She left his office and he never saw her again

A short time thereafter the patient began this action by the service of a summons No complaint was ever served, nor any steps taken by the patient after the service of the summons We thereupon moved to dismiss the action because of plaintiff's failure to prosecute the same The Court granted our motion, thus terminating the action in the doctor's favor

---

TRAUMATIC CATARACT—CLAIMED NEGLIGENCE IN TREATMENT

A man engaged in manual labor was sent by his employers to the defendant doctor for treatment in connection with a serious injury to his eye He gave a history of having had his eye punctured by a steel drill An examination disclosed that there was a serious laceration at the irido-sclero junction and also a traumatic cataract The iris was prolapsed and there was no vision in the injured eye, except light perception The eye was greatly inflamed The doctor first replaced the iris and treated the eye with atropine and cold cloths and bound the eye tightly to keep the wound closed The doctor saw him on four occasions covering a period of about three weeks The inflammation gradually subsided and there was some improvement in the vision On the occasion of his last visit a vision test showed that he had 20/50 vision, but in the light of the injury which the eye had sustained, i e, a general ophthalmitis, the doctor was not able to give the patient a very favorable prognosis for the future. The patient was told to return, but never did so

Some two years after the last treatment the patient began an action, in which it was claimed that by reason of the defendant's negligence, it became necessary to enucleate the plaintiff's injured eye

A motion was promptly made on behalf of the defendant doctor to dismiss the complaint upon the ground that the action was barred by reason of the fact that it had not been begun within the two-year period of time fixed by the statutes of this state, and when the matter came on to be heard the court granted our motion and dismissed the complaint

LONDON LETTER

BRITISH MEDICAL TOPICS

Co-operation in Medicine—During the war, the demands of women for opportunities to study medicine were met by the admission of women for clinical instruction on the roll of students at many of the teaching hospitals in London Preclinical instruction had always been available to women, but before the war only the Royal Free Hospital provided the actual clinical work. The experiment was not altogether successful It was said that men preferred to go to schools where women were excluded, that certain subjects were difficult to teach to mixed audiences, that women tended to crowd to the front at demonstrations, that special accommodation was necessary, and that there was a great wastage after qualification owing to marriage So one by one the hospitals withdrew their facilities and the condition tended to revert to pre-war standard Eventually London University appointed a Committee to consider the whole subject, and its Report is just issued Very decidedly the Committee disposes of all the traditional arguments against co-education "We are unable," they say, "to see any valid argument on the merits against the provision of co-education in medicine The prepossession of the Universities is in favor of such co-education" However, they admit, while they deplore, the antipathy of some male students to work with women, and they recommend that certain schools be reserved for men and others for women, and that a third group should admit both men and women In that way the services of Schools with the highest prestige and teachers with the highest distinctions will be available for women We shall await with great interest the result of this Report, which, coming from so authoritative a source, may well have an important influence on co-education in medicine

American Students at Edinburgh—At the Edinburgh University Dinner last week Professor Wilkie announced that applications had been received from an army of young American students (estimated at 600) who desire to be enrolled as medical students in Edinburgh Such a determined movement may well puzzle those who are interested in medical education What do these students hope to gain from the oldest seat of learning which they cannot obtain from the newest? Is it a revival of the feeling, so universal in the early days of American development, that a visit to Europe was an essential part of medical education? This feeling was most highly developed in Philadelphia

Sterilization of the Unfit—There has been a renewed interest in the very thorny subject of the sterilization of the unfit as the result of a letter in a London Journal signed by the Bishops of Durham and Exeter, by many leading medical men, and others interested in the social welfare of the community Those who support the movement for the prevention of the multiplication of the mentally defective have so strong a case that the other side must have some cogent reasons to advance wherewith to support their opposition If it be true, as the appeal says, that millions of money are being spent "on rearing children which will be a curse to their families and a burden on the State," it is not a far step to argue that those who can produce only children which must injure the race should be prevented from breeding children at all Several States in American have passed laws to this effect though whether they have been put into operation is doubtful, but the Swiss Canton de Vaud has, as recently as last October, passed a law extending previous legislation with regard to sterilization The real difficulty that leads to Government inaction is, I suppose, the disinclination to make compulsory any course of treatment which may have some risk, however slight, to life However little mortality may attend the sterilization of the male, there is little doubt that the sterilization of the female by a surgical operation must involve a definite risk, and will be attended by a mortality, even if low Perhaps in the future X-rays or radium may provide a safe method, but the time has not yet arrived When we consider that the Government dare not even make vaccination against small-pox compulsory, there seems little hope that it will take this much more drastic step And there is another obvious objection, it will be the duty and responsibility of some body, or some individual, to decide whether the subject of the enquiry is mentally defective, and if so, whether the defect is of such a nature that the offspring must be detrimentally affected The responsibility may be shared so as to avoid the risk of a mistake or a scandal, but the issue must always rest with the medical profession Now human nature—and a Government is human nature *in excelsis*—has always been distrustful of the scientists The man in the street does not understand him, he suspects him of mysterious and malign powers allied to Black Magic and the Evil Eye, he is jealous of his aloof standpoint, and, in a word, he does not trust him This attitude is well summarized in the remark I heard the Lord Chief Justice of England (Lord Hewart) make "England shall not be ruled from Harley Street!" This distrust will be the main stumbling block in the path of legislation for the sterilization of the mentally defective

H W Carson, F R C

THE ANNUAL MEETING

THE SCIENTIFIC PROGRAM

The following scientific program of the one hundred and twenty-third annual meeting of the Medical Society of the State of New York, to be held in Utica, June 5 and 6, 1929, has been prepared by the Committee on Scientific Work

Chairman

John A Lichty, Clifton Springs
Hyzer W Jones, Utica
Gordon Gibson, Brooklyn
Carl G Leo-Wolf, Niagara Falls
Harry M Weed, Buffalo

Arthur J Bedell, Albany, N Y
David C Wilson, Clifton Springs
Jerome Kingsbury, New York City
Leo F Schiff, Plattsburg
Benjamin J Slater, Rochester
Samuel J Kopetzky, New York City

GENERAL MEETINGS

Tuesday June 4th, 2 00 P M

Presiding Officer John A Lichty, M D, Clifton Springs

1 "The Early Recognition of Pulmonary Tuberculosis," Lawrason Brown, M D, Saranac Lake, and John N Hayes, M D, Saranac Lake

Discussion Ezra Bridge, M D, Rochester, and William H Ordway, M D, Mt McGregor

2 "The Relation of Colds to Pneumonia," James W W Dimon, M D, Utica

3 "The Prevention and Treatment of Pneumonia," Russell La F Cecil, M D, New York City

Discussion opened by Milton B Rosenbluth, M D, New York City and Clayton W Greene, M D, Buffalo

4 "A Consideration of Potential Diabetes—Prevention of Diabetes Mellitus," Floyd R Wright, M D, Clifton Springs

5 "Surgery of the Diabetic Patient," C Gordon Heyd, M D, New York City

Discussion opened by Byron D Bowen, M D, Buffalo

Wednesday, June 5th, 2 00 P M

Presiding Officer Hyzer W Jones, M D, Utica

1 "Diseases of the Breast," Jonathan M Wainwright, M D, Scranton, Pa (By invitation)

Discussion opened by Frank E Adair, M D, New York City

2 "Intestinal Obstruction," John B Deaver, M D, Philadelphia, Pa (By invitation)

Discussion opened by John E Jennings, M D, Brooklyn

3 "Toxemias of Pregnancy," John O Polak, M D, Brooklyn

SECTION ON MEDICINE

Chairman — John A Lichty, M D, Clifton Springs
Secretary — A H Aaron, M D, Buffalo

Wednesday, June 5th, 9 00 A. M

1 "The Natural History of Rheumatic Infection," May G Wilson, M D, New York City

2 "Complete Diagnosis of Cardiac Conditions," Robert H Halsey, M D, New York City

3 "The Interpretation of Gastric Analyses," Albert F R. Andresen, M D, Brooklyn

4 "A Discussion of Upper Abdominal Pain," Edward C Reifenstein, M D, Syracuse

Discussion opened by Irving Gray, M D, Brooklyn, and Edward R Evans, M D, Utica

Thursday, June 6th, 9 00 A. M

1 "The Interpretation of Blood Pressure Readings," Allen A Jones, M D, Buffalo

2 "The Kidney in Hypertension," Alfred M Wedd, M D, Clifton Springs

Discussion opened by William S McCann, M D, Rochester, and James F Rooney, M D, Albany

3 "The Importance of Extrasystolic Arrhythmias in Young Adults," Louis F Bishop, M D, New York City

4 "Cancer—Its Nature, Prevention and Treatment," Frank E Adair, M D, New York City

Discussion opened by Albert R McFarland, M D, Rochester

SECTION ON SURGERY

Chairman — Hyzer W Jones, M D Utica
Secretary — William D Johnson, M.D, Batavia

Wednesday, June 5th, 9 00 A M

1 "Malignant Disease of the Thyroid," George E Beilby, M D, Albany

Discussion opened by Emil Goetsch, M D, Brooklyn

2 "Minor Points in Major Surgery," George W Cottis, M D, Jamestown

Discussion opened by Albert G Swift, M D, Syracuse

3 "Injuries of the lower back," William L Sneed, M D, New York City

Discussion opened by Charles H Baldwin, M D, Utica

4 "Some of the Causes of Death in Operations of the Gallbladder," Edgar R McGuire, M D, Buffalo

Discussion opened by Charles W. Webb, M D, Clifton Springs

Thursday, June 6th, 9 00 A. M

1 "Post-operative Collapse of the Lung," Murray Mac G Gardner, M D, Watertown

2 "Chronic Appendicitis," Roger Durham, M D, Brooklyn

3 "Motion Picture Films on Prostatic Hypertrophy and on Hydrophobia," T Banford Jones, M D, Rochester

---

SECTION ON OBSTETRICS AND GYNECOLOGY

Chairman — Gordon Gibson, M D, Brooklyn
Secretary — George M Gelser, M D, Rochester

Wednesday, June 5th, 9 00 A. M

1 "Uterine Cancer, Factors that Influence Prognosis and End Results," William P Healy, M D, New York City

2 "Rectal Anæsthesia in Dry Labor," Paul T Harper, M D, Albany

3 "Sterilization by Simple Tubal Resection," Eliot Bishop, M D, Brooklyn

4 "The Management of Infected Abortion," James E King, M D, Buffalo

Discussion opened by Onslow A Gordon, Jr, M D, Brooklyn

Thursday, June 6th, 9 00 A M

1 "The Surgical Treatment of Urinary Obstruction at the Ureteral Pelvic Junction," Nathan P Sears, M D, Syracuse

Discussion opened by Henry D Furniss, M D, New York City

2 "Sterility Diagnosis The Study of Sperm Cell Migration in the Female and the Interpretation of Findings," William H Cary, M D, New York City

3 "The Management of Breach Presentation," Karl M Wilson, M D, Rochester

Discussion opened by George W Kosmak, M D, New York City

4 "The Value of the Sedimentation Test in Gynecology," Edward A Bullard, M D, New York City

---

SECTION ON DERMATOLOGY AND SYPHILOLOGY

Chairman — Jerome Kingsbury, M D, New York City
Secretary — Louis Tulipan, M D., New York City

Wednesday, June 5th, 9 00 A M

1 "Pseudo Pellagra Occurring in Alcoholics," Edward R. Maloney, M D, New York City, and Louis Tulipan, M D, New York City

Discussion opened by Albert R McFarland, M D, Rochester

2 "Creeping Eruption"—with Lantern Demonstration, J Lee Kirby-Smith, M D, Jacksonville, Fla (By invitation)

3 "Koilonychia," George M MacKee, M D, New York City

Discussion opened by Louis B Mount, M D, Albany

4 "Tropical Diseases of the Skin"—with Lantern Demonstration, Howard Fox, M D, New York City

Discussion opened by E N Bocanegra Lopez, M D, New York City

5 "Basal Metabolism in Diseases of the Skin," Binford Throne, M D, Brooklyn

Discussion opened by C N Myers, Ph D, New York City

Thursday, June 6th, 9 00 A.M

1 "Alfred Fournier—The Master Syphilologist," Paul E Bechet, M D, New York City

2 "A Study of the Wassermann Reaction fol-

lowing Dermatitis and Jaundice from Arsphenamine," A Benson Cannon, M D, New York City

3 "The Modern Treatment of Syphilis" With a relative evaluation of the various remedies and methods employed Jay Frank Schamberg, M D, Philadelphia, Pa (By invitation)

4 "Paget's Disease of the Nipple"—With Lantern Demonstration, J Frank Fraser, M D, New York City

Discussion opened by J Gardner Hopkins, M D, New York City

5 "Treatment of Ringworm Infection of the Hands and Feet," Fred Wise, M D, New York City

Discussion opened by E Wood Ruggles, M D, Rochester

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman — David C Wilson, M D, Clifton Springs
Secretary — James H Huddleson M D, New York City

Wednesday, June 5th, 9 00 A.M

1 "Traumatic Neuroses Affecting the Eye, Ear, Nose and Throat," Theodore H Weisenburg, M D, Philadelphia, Pa (By invitation)

Discussion opened by John L Eckel, M D, Buffalo

2 "Traumatic Neurosis from the Industrial Viewpoint," Benjamin J Slater, M D, Rochester

Discussion opened by Michael Osnato, M D, New York City

3 "The Medical Phase of the Workmen's Compensation Law," Joseph S Lawrence, M D, Albany

4 "The Surgical Treatment of Non-neoplastic Diseases of the Nervous System" Lantern Slides and Moving Pictures Henry W Williams, M D, Rochester

Discussion opened by Francis C Grant, M D, Philadelphia (By invitation)

Thursday, June 6th, 9 00 A.M

1 "The Psychoanalytic Treatment of the Borderline Mental Diseases," Clarence P Oberndorf, M D, New York City

Discussion opened by Edward A Sharp, M D, Buffalo

2 "The Practical Application of a Mental Hygiene Program," Noble R Chambers, M D, Syracuse

3 "The Treatment of Mental Diseases in a General Hospital," Thomas J Heldt, M D, Detroit, Mich (By invitation)

4 "The Treatment of Mental Patients in the New York State Hospitals," William C Garvin, M D, Binghamton

Discussion opened by William W Wright, M D, Utica

SECTION ON DISEASES OF THE EYE, EAR, NOSE AND THROAT

Chairman — Harry M Weed, M D, Buffalo
Secretary — Edwin S Ingersoll, M D, Rochester

Wednesday, June 5th, 9 00 A.M

Joint Session with Section on Neurology and Psychiatry for the First Address

1 "Traumatic Neuroses Affecting the Eye, Ear, Nose and Throat," Theodore H Weisenburg, M D, Philadelphia (By invitation)

Discussion opened by John L Eckel, M D, Buffalo

2 "Lesions of the Visual Pathway from Chiasm to Cuneus Lobe and the Pituitary Relation Thereto," George F Suker, M D, Chicago (By invitation)

This lecture will be illustrated by drawings, charts and wet specimens

Discussion opened by Conrad Berens, M D, New York City

3 "Pulsating Exophthalmos—With Report of a Case," Anton S Schneider, M D, Plattsburg

4. "Treatment of Laryngeal Tuberculosis With Goerz-Wessely Lamp," Joseph W Miller, M D, New York City

Thursday, June 6th, 9 00 A M

1 "Keratitis Exfoliativa Complicating Dermatitis Exfoliativa," Daniel B Kirby, M D, New York City

Discussion opened by John M Wheeler, M D, New York City

2 "The Clinical Interpretation of the Retinal Arterial Changes and Retinitis in Cardio-vascular-renal Diseases," John F Gipner, M D, Rochester

Discussion opened by Martin Cohen, M D, New York City

3 "Ocular Tuberculosis still a comparatively uncommon Diagnosis in Clinical Ophthalmology" and case reports Macy L Lerner, M D, Rochester

Discussion opened by Edmond E Blaauw, M D, Buffalo

4 "Passing Years in Oto-laryngology," Leonard W Jones, M D, Rochester

5 "The Treatment of Polypoid Sinusitis," G Allen Robinson, M D, New York City

Discussion opened by John J Rainey, M D, Troy

SECTION ON PEDIATRICS

Chairman — Carl G Leo-Wolf, M D, Niagara Falls
Vice-Chairman — John Ailman, M D, Rochester
Secretary — Marshall C Pease, M D, New York City

Wednesday, June 5th, 9 00 A M

1 "The Role of Streptococci in Rheumatic Fever," James C Small, M D, Philadelphia, Pa (By invitation)

2 "The Heart in Rheumatic Fever," John A Oille, M D, Toronto, Ont (By invitation)

3 "Rheumatic Fever in Children and Its Clinical Aspects," Albert D Kaiser, M D, Rochester

Discussion on these three papers will be opened by Roger H Dennett, M D, New York City

4 "The Treatment of Epidemic Meningitis," Josephine B Neal, M D, New York City

Discussion opened by Henry W Jackson, M D, and Adolph G De Sanctis, New York City

5 Significant Chemical Changes in the Spinal Fluid and their Practical Value," John A Killian, Ph D, New York City (By invitation)

Thursday, June 6th, 9 00 A. M

1 "Ear Infection in Babies," Marvin F Jones, M D, New York City

Discussion opened by DeWitt H Sherman, M D, Buffalo, and Charles A Wisch, M D, Niagara Falls

2 "The Allergic Diseases in Children," T Wood Clarke, M D., Utica

3 "Obstruction of Bladder Outlet in Children," Meredith F Campbell, M D, New York City

4 "Education, Health and Health Education," Frank vander Bogert, M D, Schenectady

5 "Acute Nephritis in Children," John D Lyttle, M D, New York City

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman — Leo F Schiff, M D, Plattsburg
Secretary — William L. Munson, M D, Granville

Wednesday, June 5th, 9 00 A. M

1 "Organization of Field Work On Tuberculosis in a Rural County," William C Jensen, M D, Glens Falls

2 "Smoke Nuisance," Thomas Darlington, M D, New York City

3 "Report on 1929 Legislation," Paul B Brooks, M D, Albany

4 "The Health Administration of the Panama Canal Zone," Bertis R Wakeman, M D, Hornell

5 "Are the Physicians Fully Co-operating with Health Department in Stamping Out Communicable Diseases?" Francis E Fronczak, M D, Buffalo

Thursday, June 6th, 9 00 A M

Diphtheria Prevention in New York State

a "Report on Progress to Date," Herman F Senftner, M D, Albany

b "What We did in Niagara Falls," Edward E Gillick, M D, Niagara Falls

c "Interesting the Small Community," Frederick W Sears, M D, Syracuse

THE COMMERCIAL EXHIBITS

The Committee on Arrangements of the Annual Meeting of the Medical Society of the State of New York, and Joseph B Tufts, the Advertising Manager of the NEW YORK STATE JOURNAL OF MEDICINE, have prepared a *Commercial Exhibit* of articles used by physicians in their practice of medicine The exhibitors are advertisers in the JOURNAL and Directory, and their wares are essential to every physician who attends the annual meeting It will be of mutual benefit to both the medical profession and the exhibitors if physicians will visit with the demonstrators and learn from them how to use the wares The exhibits will be on the mezzanine floor of the Hotel Martin, and as is shown on the diagram on the next page They will open on Monday afternoon, June 3, at two o'clock, and will remain open during all the sessions of the meeting

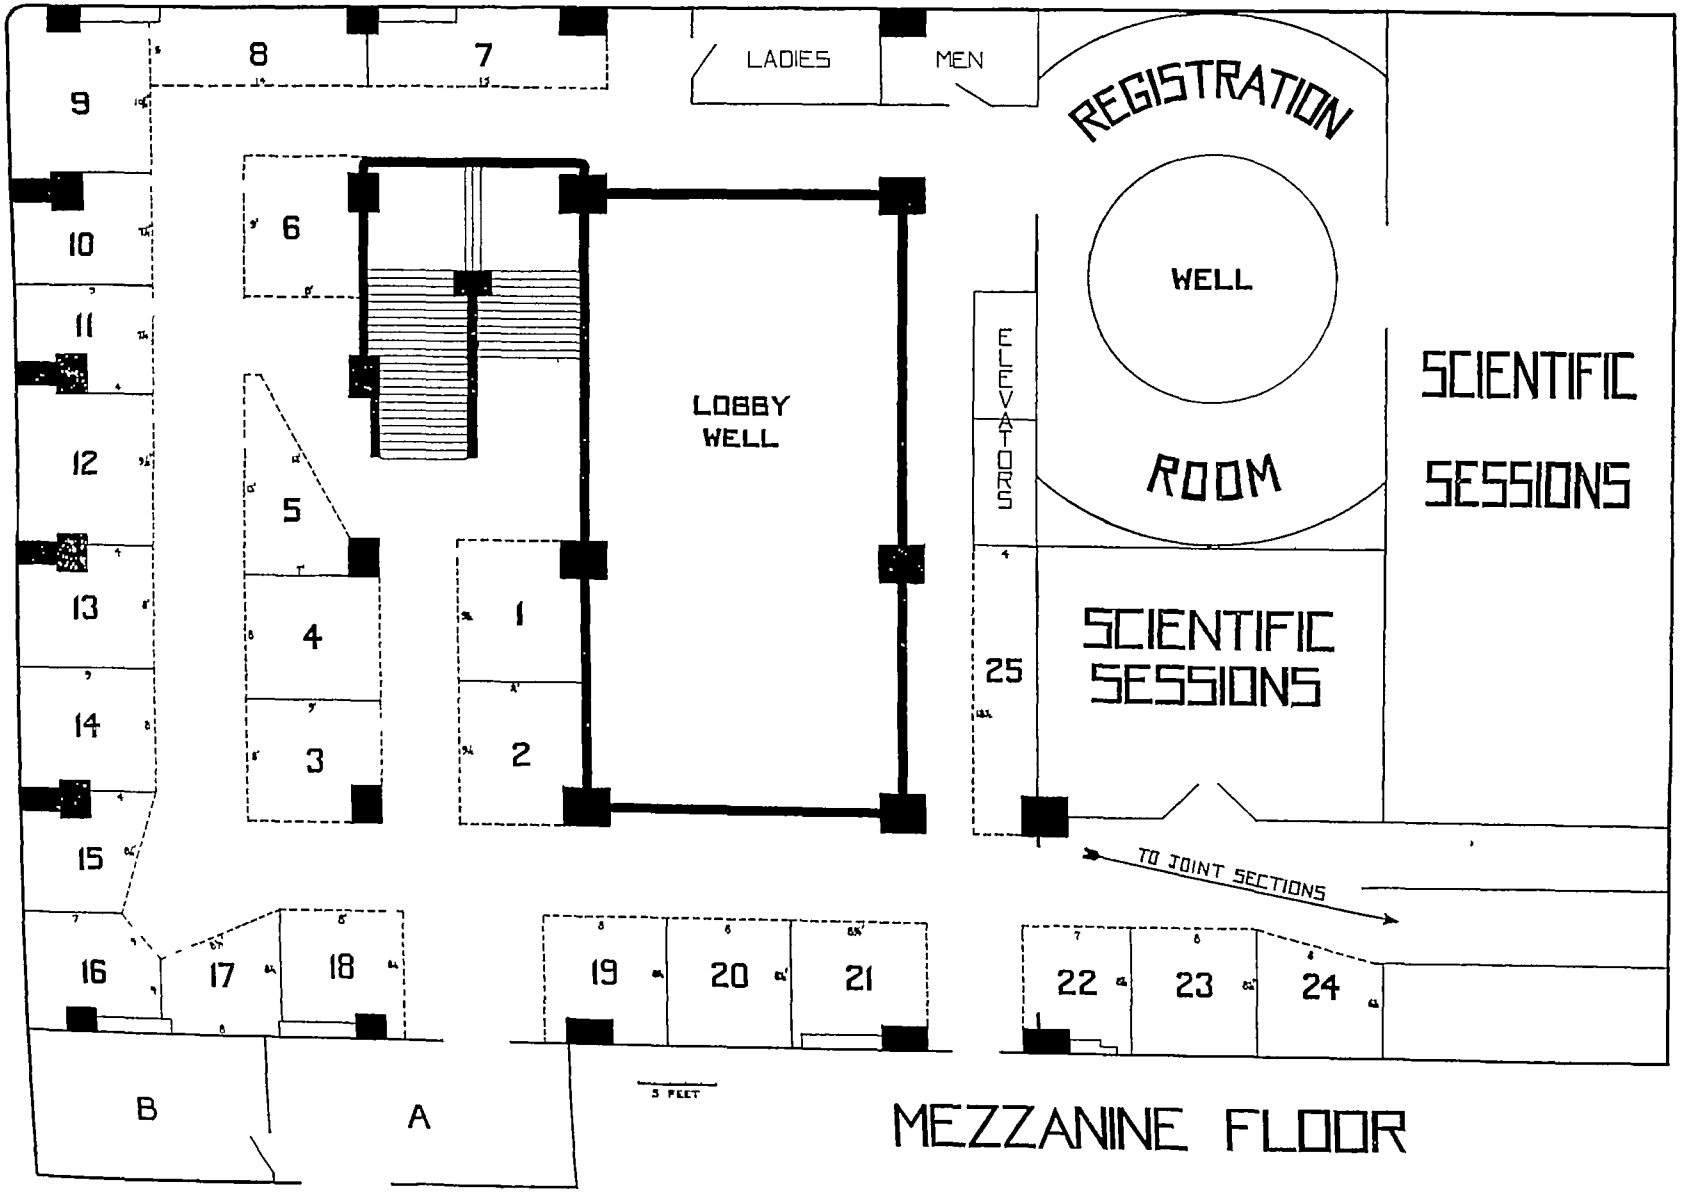

Diagram of Exhibit Hall Hotel Martin, Utica, N Y Annual Meeting Medical Society of the State of New York, June 3, 4, 5, and 6, 1929

DESCRIPTIONS OF THE COMMERCIAL EXHIBITS

Booth 14—Abbott Laboratories, Chicago and New York During the past few years the research workers of the Abbott Laboratories have developed a number of new and useful products which, after exhaustive clinical investigations, are now ready for the market

These products will be on exhibit at the Convention in June, and include Calsoma, Calcilact, Butyn Eye Ointment, Amiodoxyl Benzoate, Calcium-O-Iodoxy Benzoate, Cinchopyrine, Dysco, Butyn Ephedrine Solution, Metaphedrin and Taroxide.

Booth 16—American Optical Company, New York, will exhibit its well-known line of oculists' supplies, especially the Tillyer lenses for eye glasses These lenses are accurate to their very edges, and give a field of view that is remarkably free from distortion

Booth R—Bard-Parker Company, Inc, New York Two new products are being demonstrated, both intended to increase the efficiency of the Bard-Parker Knife These products are the Bard-Parker Formaldehyde Germicide and Bard-Parker Sterilizing Container, the latter being designed for use in connection with Bard-Parker Formaldehyde Germicide in the sterilization of Bard-Parker Knives This container is complete with two trays, constructed to hold four Bard-Parker handles with detachable blades

Booth 18—Cameron's Surgical Specialty Company, Chicago and New York Light when, where and how he wants it is essential to every physician, as is shown by the great number of operating lamp fixtures, many of which are clumsy and hot, in the hospitals and offices today Cameron's Boilable Lamps and Instruments efficiently reveal the field of diagnosis or operation in all of its detail and in its actual color and condition by giving you clean, cool, concentrated white light at your finger tips in all of your work That is why you will be interested in having a complete demonstration of Cameron's Electro-Diagnostic and Operating Equipment on display at Exhibit No 18

Booth 1—G W. Carnrick Company, Newark, N J, exhibits a large number of its endocrine products The Company is engaged exclusively in the manufacture of this class of products, and has devised many laboratory processes of manufacture and control in order to assure potency and stability of the product Hormotone, a synergistic combination of hormones used in the treatment of menstrual disorders, is exhibited G W Carnick Company manufactures a full line of endocrine products including the active principles of all of the single glands A representative who is qualified to answer questions relating to manufacture and use of the products will be at their booths

Booth 10—Conti Soap Distributors, Inc., Brooklyn, N Y In the little seaport town of Livorno, Italy, known to Americans as Leghorn, a famous family of soap makers has for the past hundred years produced the finest quality of pure olive oil Castile soap known as "Conti's Castile Soap"

Since 1836, this pure Castile soap has been imported to the United States, and to this day it is still made by the descendants of the original Conti family

Physicians have endorsed the purity of Conti Castile Soap because pure olive oil is its only fatty ingredient, and that it contains no free alkali, or other fats and fillers It is suited to the complexion, to the tender skin of infants, and to all general toilet and bath purposes

A decision of the Federal Trade Commission, confirmed by that body a few months ago, provides that the name "Castile" may only be applied to soaps that are made from pure olive oil Conti meets this requirement, and also conforms to the requirements of the United tates Pharmacopeoia for pure olive oil Castile Soap

Physicians attending the Convention in Utica are invited to the Conti booth where the Conti line will be displayed, and where full particulars will be available

Booth 17—R. B Davis Company, Hoboken, N J One of the newest and best of the health aids for physicians Cocomalt will be featured at the meeting of the Medical Society of the State of New York at Utica, New York, June 3rd to 6th, 1929

Cocomalt gives milk a delicious, creamy chocolate flavor, pleasing to the children and adults They will drink milk without urging At the same time Cocomalt increases the entire food value over 70 per cent.

Cocomalt adds to the diet the essential and necessary vitamins A, B and D and milk minerals, calcium, phosphorous, iron, etc, in a form which is readily digested and assimilated by the body

Cocomalt derives its nutritive value as well as its delicious flavor from nature—not the chemist

Questions will be gladly answered regarding the scientific background and clinical successes of Cocomalt

Booth 19—The Denver Chemical Mfg. Company, New York, will exhibit Antiphlogistine, which is employed by physicians in all parts of the world in the treatment of inflammatory and congestive conditions Antiphlogistine, now nearing its fortieth year, is perhaps more widely used than any other ethical product There is only one way in which an ethical preparation can attain this distinction, and that is through merit Sample packages and descriptive booklets will be distributed at the exhibit

Booth 13—The DeVilbiss Company, Toledo,

Ohio DeVilbiss Atomizers, Nebulizers, Steam Vaporizers and Heater Sets will be on display in Booth No 13, at the Utica meeting of the Medical Society of the State of New York, Hotel Martin, June 3 to 6, 1929

Just recently a line of chromium plated sprays were added to the line This bright nontarnishable finish is particularly pleasing for office use"

Booth 11—H. T. Dewey & Sons Co., New York, pioneer manufacturers of medicinal wines, will exhibit their preparations, including Dewey's Emulsion of Cod Liver Oil, Port Wine and Irish Moss which is a product valuable for its ingredients and because it is easy to take and digest Dew-Tone and Port, a preparation recommended for elderly and anemic people will also be exhibited It is only sold direct from their New York Store or their cellars at Egg Harbor, N J, no Federal Prescription blanks being necessary Physicians or their patients outside of the city can order it by mail No drug store is allowed to carry Dew-Tone and Port

Booth 6—Harold Surgical Corporation, New York, expects to have a complete and comprehensive exhibit at Utica and will specialize on high frequency apparatus including diathermy and electro-surgery apparatus The exhibit will be in charge of Mr Fred Seigel, who is an expert in high frequency apparatus, and he will demonstrate the new features of the combined diathermy and electro-surgery apparatus

The exhibit will also feature several new models of the Ultra-Violet Ray Carbon Arc Lamp

Booth 4—The Heidbrink Company, Minneapolis, Minnesota, will exhibit the most modern devices for gas-oxygen anesthesia either for the individual practitioner or for institutional use There will be displayed the complete line from the small portable obstetrical unit to the large four-gas Lundy-Rochester Hospital Unit Mr L B Reason will be in charge and will be glad to make appointments for practical demonstrations

Booth 15—Horlick's Malted Milk Corporation, Racine, Wisconsin The value of Horlick products in the dietetic care of the sick and convalescent will be featured at the Horlick's Malted Milk exhibit Horlick's Maltose and Dextrin Milk Modifier will also be one of the main topics

Samples of Horlick's the Original Malted Milk, natural and chocolate flavor, and of Horlick's Malted Milk Tablets will be provided for convention visitors

Booth 22—Kalak Water Company of New York, Inc, New York

The Kalak Water Company will again be present with an exhibit of Kalak Water, the strongest alkaline water of commerce (nonlaxative) Physicians are invited to call at their booth and partake freely of Kalak Ask to see demonstration of our Kalak Urinalysis Indicators for determining the depletion of the alkaline reserve

Booth 9—McIntosh Electrical Corporation, Chicago and New York Electric apparatus for physical therapy will be shown by the McIntosh Electrical Corporation The list includes *x*-ray machines, diathermia apparatus and high frequency generators

Booth 24—Mellin's Food Company, Boston, Mass No argument is needed to emphasize the advantage to the physician of a thorough knowledge of any product that he deems worthy of frequent or only occasional use in the work of his profession. This is the thought that prompts the Mellin's Food Company to have an exhibit, and the purpose is to give physicians an opportunity to acquire full and complete information relative to the source, nature and amount of food elements present in Mellin's Food, and to discuss the many conditions where Mellin's Food may be used to the advantage of the patient and satisfaction of the medical attendant

Booth 20—M. & R. Dietetic Laboratories, Inc, Columbus, Ohio Similac, a complete modification of cow's milk, is exhibited in space No 20 by the M & R Dietetic Laboratories, Inc, of Columbus, Ohio This product is something new in the way of a modified milk for both supplemental and complemental feedings Physicians are invited to ask for information as to how the Similac approximates breast milk, and why the product has a very definite place in the field of infant feeding

Booth 8—Metropolitan Life Insurance Company, New York "See Your Doctor" panels, illustrating educational channels used by Metropolitan Life - Insurance Company—including literature, films, advertising, correspondence, a Nursing Service, etc—to advocate prompt, regular and reliable private medical service for sickness prevention and treatment, and health promotion, among twenty-six million policy-holders

Booth 12—Mutual Pharmacal Company, Syracuse, N Y, will exhibit products of their laboratory during the Annual Meeting of the State Society

Physicians are cordially invited to visit Booth 12 and inspect the products shown

Samples of any product of the laboratory will be mailed upon request and registering at the booth

Booth 21—Merrell-Soule Company, Inc, New York, will have on exhibit and for examination its group of standard powdered milks for infant feeding and adult diet This group now includes Klim Powdered Whole Milk, Merrell-Soule Powdered Protein Milk, Merrell-Soule Powdered Whole Lactic Acid Milk and their fat-free companion products

Reliquefied Klim (cold) will be served and the simplicity of preparing lactic acid milk formulas from Merrell-Soule Powdered Whole Lactic Acid Milk will be demonstrated

Technical representatives of the world's largest milk company will be in attendance at all times

Booth 26—Merck & Company, Inc., Rahway, N J In the Merck booth will be shown a display of many interesting, established and new therapeutic agents from the combined line of Merck & Co and of Powers-Weightman-Rosengarten Co Among the remedies to be shown are Digitan, Optochin Base, Erythrol Tetranitrate, Iodipin, Bromipin, Skiabaryt, Bismosol, Arsphenamine, Sulpharsphenamine, Novarsenobenzol Billon, Tryparsamide and Stovarsol Trained attendants will be present to give special information to those interested in any of the above remedies

Booth 5—Picker X-ray Corporation, New York, with offices in New York, Boston and Buffalo and service stations in Rochester and Syracuse will exhibit *x*-ray and physical therapy apparatus of various types and sizes, which will be of interest to the specialist as well as the general man

A new bulletin will be ready for distribution at this meeting, and will contain information of exceptional interest to every physician and hospital

Booth 7—G. D. Searle & Company, Chicago, Ill Arsenicals and Bismuth Sodium Tartrate will be shown by G D Searle & Co, Chicago Searle Arsenicals are made by the aqueous hydrochloric acid process rendering them free from methyl alcohol and methyl derivatives with their untoward clinical manifestations Bismuth Sodium Tartrate is a water-soluble bismuth salt, administered intramuscularly in aqueous solution, for the treatment of syphilis It is free from the objectionable features associated with oil suspensions

Booth 23—Tailby-Nason Company, Boston, Mass Producers of Nason's Palatable Cod Liver Oil, will have a display of Nason's Cod Liver Oil "The Better Tasting Kind" produced and refined in Nason's plants in Norway Nason's Cod Liver Oil is warranted to be of the highest vitamin A and D potency Just a dash of flavor added to the clear oil makes Nason's Oil pleasant and easy to take

Important features of the exhibit will be the white rats used in testing the Oil for its vitamin activity and roentgenographs of the leg bones of rachitic rats showing the progress of the healing induced by Nason's Cod Liver Oil

Booth 3—George Tiemann & Company, New York, will display well-known line of surgical instruments, and also a number of specialties including

Super Sun carbon arc and infra red lamp,
Unger blood transfusion apparatus,
Flagg inhaler,
Parker arthriflexometer,
Barton Obstetric forceps,
Electric Calidair,
Pfarre Two-Way Syringe,
Pitkin Spinal Anaesthesia outfit and tiltometer
Montague Rectal instruments

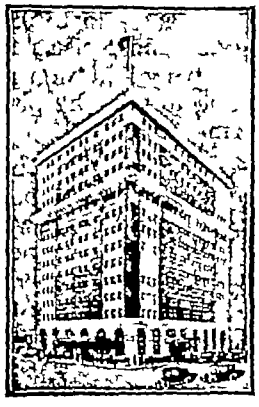
The profession is cordially invited to attend the display

Booth 2—Victor X-ray Corporation, Chicago and New York, will show a complete display of Physical Therapy equipment, including Ultra-Violet Lamps, a Vario-Frequency Diathermy Outfit, Phototherapy and Infra-Red Generators, as well as the new Victor Electrocardiograph The Victor *x*-ray office and Portable Outfit is also on display As manufacturers of complete *x*-ray, Physiotherapy and Muscle Re-educational equipment, the company will offer much valuable information relative to your hospital and private laboratory problems

Booth 25A—Vitaglass Corporation, New York. Ultra-violet ray glass is becoming of increasing importance with the growing knowledge of its advantage both in the treatment in hospitals for diseases where light therapy is indicated, and as a general health prophylaxis where people are confined for long periods of daylight hours indoors

This glass was invented by Professor Lamplough, of Trinity College, Cambridge, England, five years ago It has been tested successfully both in England and this country where it was introduced by the Vitaglass Corporation two years ago

The Vitaglass booth will be supervised by W Wallace, Jr, Director of Research, who will explain the various biological tests, and be glad to answer all questions



Booth 25—Wappler Electric Company, Long Island City and New York, will have a comprehensive display of x-ray and Physical Therapy Equipment Included will be the Wappler Monex Valve Tube Rectifier Apparatus for radiography, fluoroscopy and superficial skin therapy, the improved model Wappler Electrotherm for medical and surgical diathermy, the Portable Endotherm for surgical diathermy and endothermy, and the Wappler Myostat Galvanic and Wave Current Generator You are cordially invited to inspect the apparatus at the Wappler booth

THE HOTELS OF UTICA

The three principal hotels of Utica have nearly one thousand rooms which means that they can accommodate 1500 guests with all the comforts of the hotels of the largest cities Every doctor who attends the annual meeting may be assured of ample living accommodations He may also have the room of his choice, provided he makes his reservation early

HOTEL UTICA

The Hotel Utica, with 350 rooms, will be the general headquarters, and will be the meeting place of the House of Delegates and some of the Scientific Sections

HOTEL UTICA—350 ROOMS

Single Rooms, $3 to $6 per day
Double Rooms, Double Bed, $5 to $8
Double Rooms, Twin Beds $6 to 8 50

HOTEL MARTIN

The Hotel Martin, with 450 rooms, will contain the Registration Desk, the Commercial Exhibits, and some of the Scientific Sections

HOTEL MARTIN 450 ROOMS

With Bath, Single $2, Double $3 50 per day
With Shower, Single $2 50, $3, $3 50—$2 per additional person
With private tub, Single, $3, $3 50, $4
Twin beds with bath, $5, $5 50, $6 and $7
Parlor, Bedroom and Bath, $10 and $12 per day

HOTEL MAJESTIC

The Hotel Majestic with 150 rooms, is close by the other two hotels, and will supply accommodations which will be pleasant, convenient and satisfactory

ROOM RATES

With private bath, or shower bath, Single, $2 75 to $3 50, Double, $4 to $5

With running water near public tubs or showers Single $2 to $2 50, Double, $3 50

Proportionate rates for suites with bath

NEWS NOTES

RABIES CONTROL IN WESTCHESTER COUNTY

Efforts which the health officers of lower Westchester County, especially, have been putting into the control of dogs during the last couple of years is apparently bearing fruit Thus far this year, 1929, only three rabid dogs have been reported in our territory, two in Yonkers and one in White Plains, and, as we are preparing this sheet for the mimeograph, not a rabid dog has been reported for the month of March Unless this record is spoiled by later reports, March will go down in history as the first month in over three years in which there have been no reports of rabid dogs We have hesitated about giving out this news fearing that perhaps lay authorities, not appreciating the variable and often long period of incubation of rabies in dogs, might be tempted to pull on the purse strings and curtail the gathering in of unmuzzled dogs Every health officer will appreciate that if we will not only continue but increase our efforts in enforcement of muzzling and gathering in and humane destruction of the unowned dog, we stand an excellent chance of ridding this territory of the scourge

RICHARD SLEE,
District State Health Officer

MONROE COUNTY

The Medical Society of the County of Monroe held its regular meeting on March 19, 1929

The following were elected to membership Drs Knox Brittain, Paul H Garvey, R. F Herrman, N M Humphrey, T B Jones, H E Pearse, W S Ruben, H F St. John, W W Scott, R B Wohlrab

Dr W A Calihan, Chairman of the Legislative Committee, discussed the current chiropractic bill, and announced that his committee was distributing petitions of protest, which he urged the members to have signed

Dr E G Whipple, Chairman of the Committee on Tuberculosis, discussed the anti-tuberculosis campaign, and introduced the following resolution, which was adopted "Resolved, that the Medical Society of the County of Monroe approve of the National Early Diagnosis and Antituberculosis Campaign and that it will direct the local activities of this campaign through the Society's Committee on Tuberculosis"

After discussion of the question of ambulance service throughout the county, outside of the City of Rochester, the President appointed the following committee to investigate and report to the next meeting Dr Geo Sanders, Chairman, Drs R B Partridge and C R. Keller

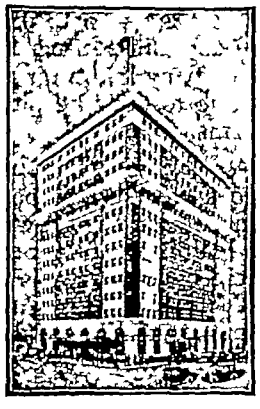
Dr Paul H Ringer of Asheville, N C., presented "A Survey of Collapse Therapy in Pulmonary Tuberculosis" Dr Ringer gave a very interesting and instructive paper on his subject, giving with exceptional clarity the indications for and against collapse therapy in general, and the special indications for its various forms The paper received excellent discussion

J P HENRY, *Secretary*

CORTLAND COUNTY

At the regular March meeting of the Cortland County Medical Society held March 20th, it was voted that the President be asked to call special meetings monthly for the presentation of scientific papers until such a time that the By-Laws could be amended in accord with the rules of the Society The same evening Dr Lewis C. Wagner of New York City addressed the Society on "The Treatment of Non-Union and of Mal-Union in Fractures"

On March 7th the Society was addressed by Dr J P Kane of the Gorgas Health Caravan concerning Periodic Health Examinations



ALBERT A BAILEY, *President*

MEDICAL WARES

DIGITALIS

Digitalis is one of the most important drugs used by doctors It is indispensible in certain types of disease of the heart and kidneys, and when it is given intelligently, the doctor expects to get certain definite results from it Modern research has revealed the sources of variation in the drug, and the skill of manufacturers has resulted in the preparations of digitalis whose potency is indicated as accurately as is the tensile strength of a wire that enters into the construction of a suspension bridge

The digitalis on the market consists of the leaves of a perennial plant, Digitalis purpurea, or foxglove, which grows wild in various parts of Europe and America and is often planted in gardens for its beautiful, tall blooms The leaves are gathered in their second year of growth and are dried with great care in much the same manner as tobacco The plant is cultivated in the United States and in England, Germany and Austria, and the leaves are shipped to market in bales of about two hundred and fifty pounds weight When the digitalis leaves are properly grown, dried, and powdered, they retain their strength unimpaired for years

The potency of different lots of digitalis varies, the strength of some samples being double that of others Fortunately, there is a remarkable constancy in the strength of the active principles of a strain of plants grown in a particular locality under uniform conditions of seed, soil and climate

The active principles of digitalis consists of glucosides which must undergo changes in the body before they produce their effects About six hours are required for the absorption of each dose of the drug, and from thirty-six to forty-eight hours for the production of digitalization It is excreted at a slow rate, and so when the maximum effects of the drug have been reached, only a grain or two of digitalis is required daily in order to maintain its full therapeutic effects

The potency of digitalis is accurately expressed in two ways

1 Frog units
2 Cat units

A frog unit is the amount of tincture of digitalis that is required to produce permanent systolic contraction of the heart in one hour when it is injected into the ventral lymph sac of a frog The U S P requirement is that from 0 0055 to 0 0065 cubic centimeters of the tincture shall contain one frog unit. This amounts to from 1500 to 1800 frog units for each gram of the dried digitalis The average amount required to digitalize a patient is one and a half grams

The frog method of standardization is somewhat difficult Each experiment requires 60 frogs, and allowances must be made for the size of the frog, the temperature at which it is kept, and also the season of the year The frog method is now being displaced by one in which a cat is used, for the cat is a warm-blooded animal of considerable size, and the results obtained by its use may be applied to man with accuracy

A cat unit is the amount of dried digitalis leaves required per kilogram of body weight to stop the heart beat of a cat in one hour when an infusion of digitalis is injected into the femoral vein The cat is first etherized as if for a surgical operation The drug is injected slowly for a period somewhat less than one hour The approach of the full effects of the drug is indicated by vomiting and shallow respirations, and finally a stop-page of the heart as indicated by a stethoscope

About one and one-half grains of the dried drug on an average contains one cat unit, but one unit may be contained in one grain of a stronger leaf, or three grains may be required in a weaker sample The principal point in which a doctor is interested is that the number of cat units of each tablet or each c c. of tincture shall be uniform and be stated on the container Some manufacturers supply their tablets in the three sizes of one-half, one, and two cat units

The amount of digitalis required to produce the full physiological effects of digitalis on a patient is one cat unit for every ten pounds of his body weight For example, a man weighing one hundred and sixty pounds would require sixteen tablets, each containing one cat unit The initial dose on the first day of treatment would be four cat units, then two units are given every six hours until sixteen cat units have been given This amount will usually produce signs of digitalization as shown by a slow pulse, an increased secretion of urine and possibly of nausea The full effects of the digitalis may then be maintained by the administration of one or two units daily, or enough to replace the amount that has been excreted

Physicians are indebted to manufacturers for making standard preparations of digitalis whose strength is uniform and dependable, and whose administration is easy Many manufacturers supply free booklets giving accurate directions for the use of their particular products

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on February 20, 1929, was called to order at 9 P M, the President, Dr Aranow, in the Chair

Election of candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following candidates who were elected to membership H Elias Diamond, Paul Fagin, Bernard M Goertzel, David Lindenauer, Ben G Lipton, Julius K Littman, Arthur A Markowitz, Abraham P Matusow, Francesco Pagano, Archibald A White

Dr N B Van Etten, Chairman of the Special Diphtheria Committee, reported on the progress made in the Campaign of Toxin-Antitoxin immunization He presented posters and literature in regard to the Campaign to the members and appealed for their further cooperation

Dr Magid, Chairman of the Committee on Medical Economics, presented a Report with special reference to Dispensaries, Clinics and the Credit Bureau

The following Resolution was adopted

"Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Raphael Berger, M D,

"Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr Berger and that a minute thereof be placed on the records of the Society, and be it

"Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member"

The Scientific Program proceeded as follows

Papers

1 Misleading Urologic Symptoms, Louis Nagorsky

2 The Serum Treatment of Lobar Pneumonia, Illustrated by lantern slides, Russell L Cecil

Discussion led by Jesse G M Bullowa

In accordance with the suggestion of Dr Bullowa, it was moved and carried that the Bronx County Medical Society urge the Department of Health to request an appropriation for next year for a sufficient amount of refined anti-body serum for the treatment of pneumonia cases

I J LANDSMAN, M D, *Secretary*

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on March 20, 1929, was called to order at 9 P M, the President, Dr Aranow, in the Chair

The following candidates were elected to membership Herman J Burman, Robert Alfred Hearn, Louis Monk, Samuel S Paley, Lee Pazow, Frederick M Rauch, Lisette Kotler Soudakoff, Frederick W Williams, Naomi M Yarmolinsky

The matter of circulars soliciting compensation work and their proper or improper distribution, referred to the Society by the Comitia Minora, was then discussed It was moved and carried that the Special Committee on Revision of Medical Ethics be instructed to obtain the view of members interested in Compensation work and to study the problem and report back to the Society

The following Resolutions were introduced and carried

"Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Joseph E Donnelly, M D

"Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr Donnelly and that a minute thereof be placed on the records of the Society, and be it

"Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member"

The Scientific Program then proceeded as follows

Paper

1 Some Interesting Phases of Diagnosis of Surgical Kidney Diseases, Leo Buerger

Respectfully submitted,

I J LANDSMAN, M D, *Secretary*

favorite dummy speak Rapid readers going to the movies have always been struck by the length of time a caption is displayed They could read it a dozen times while the rest of the house mumbled it over painfully a syllable at a time Naturally, the less literate spectators are pleased that the one difficult task associated with an evening in a movie palace is now eliminated through the introduction of speech The songs may be thin and tinny and the voices hollow, but the words are intelligible

"In the finish, the competition between movies and talkies may come to a struggle between two divisions of the entertainment-seeking public—those who hear with difficulty and those who can hardly read"

QUESTIONNAIRES ON SUCCESS

The New York *Herald-Tribune* of April 3 contains an editorial on the investigation of causes of success It describes a questionnaire sent out by a "Foundation," and says

"Running over the field of human motives with a vacuum cleaner these pursuers of truth ask to know how the victim happened to select his present vocation and give him five choices as well as a blank check The possibilities range all the way from 'chance opportunity' past 'on invitation' to 'gradual swinging over from other fields' The fine art of questioning has seldom achieved more subtleties than in this comprehensive dissection of success

"For those few who doubt whether life can be thus measured, surveyed and analyzed, there is one overwhelming answer Suppose this questionary does fall short of its mark, other scientific questionaries and other statisticians will return to the task again and again Some day, some where, some one must surely get a hand on the tail-feathers of success and not return to his employers empty-handed For while life, as it does or does not achieve earthly success, is mortal, foundations, dispensing the golden life-blood of all statistics, are eternal"

Physicians whose daily work consists largely in taking histories know how difficult it is for any person to give truthful answers about themselves They are fed up with questionnaires to such an extent that the more careful doctors throw them into the waste basket, and the replies that flow in are from the less thoughtful doctors who possibly are flattered by being considered worthy of notice

DEBUNKING

There are signs of a reaction from the prevailing custom of writers to expose the petty whims and foibles of great men in an attempt to show that after all they were just ordinary mortals, and unworthy of praise But James J Montague, in the department "More Truth than Poetry" in the New York *Herald-Tribune* of April 3rd combats that idea in the following verses

I've often read that Washington
  Was not quite what he seems
To those who base the general's case
  Upon the works of Weems
I've read he had a temper
  And sometimes even swore,
But just the same no one can claim
  He didn't win the war
And though detractors may detract
They can't debunk that simple fact

I've read that Alexander
  Was really not so great,
But that he struck a bunch of luck
  By grace of favoring fate
They say his fighting tactics
  Were but of little worth,
But none the less, they all confess,
  That he once ruled the earth
And never by the slightest chance
Can they debunk that circumstance

Debunking may be useful,
  Perhaps it helps us see
That men of fame have played the game
  A lot like you or me
In holding up their failings
  It shows that Such and Such
And So and So of long ago
  Were really not so much
But there's one job we've got to do,
And that's debunk debunkers, too

THE DAILY PRESS

HUMAN AUTOMATONS

Human automatons are especially numerous in the big cities, for there they follow narrow routes of travel, and are slaves to clocks and railroad time tables The following editorial from the *New York Herald Tribune* of March 11 gives a striking example of automatism

"Thirty subway and elevated passengers of the Interborough Rapid Transit Company deposited in the turnstiles last December, we learn from the 'I R. T News,' $5 goldpieces instead of the intended nickel Only ten of the coins were claimed by the owners and refunded So twenty absent-minded New Yorkers are still out $4 95 each as penalty for acting like automata and for not being able to remember, once the yellow coin was missed, when and where the deed was done Modern biologists have looked with little favor on the Victorian idea that mankind may evolve slowly into a race of giant, hive-ruled insects, efficient enough, but as completely the slaves of blind instinct as are the ants or bees Yet despite this biological reprieve, one wonders whether modern city life may not be stimulating mental changes in this direction—changes that make men and women into automata

"Savages have rigid customs but few habits Before man had become too obviously the lord of creation he watched where he stepped and looked before he leaped One may argue of course, that several million people rode on the Interborough in December without the mistake of putting goldpiece in the turnstiles Even the fact that thirty of them did so would mean but little, it may be admitted did it stand alone But there are other symptoms The typical New Yorker seems, for example, to be acquiring a new form of absent-mindedness *He can walk ten or fifteen blocks* along the streets, crossing on the whistles and otherwise obeying familiar and instinctive signals, but all the while in a brown study, impervious to everything not his immediate concern An ant could do no more"

BANISHING FEAR

The *New York Times* of March 14 describes editorially an experiment on the control of fear made in the public schools of Boston The editorial says

"The Superintendent of Schools in Boston, Jeremiah E Burke, has started a program designed to train the pupils' emotions—to bring their emotions under the control of reason and volition In *1928* the emotion of fear was especially considered, and a practical course, conducted through classroom experiment in the fifth and successive grades and in limited time so as not to encroach upon other subjects, was begun The emphasis is put upon conquering undesirable fears by which we are all harassed, in the form of timidity or self-consciousness, dread of ridicule or failure, and upon 'raising fear to the level of intellectualized caution'

"The discussion proceeds somewhat as follows Fear is a problem common to all, there can be no courage without fear, for courage means its overcoming, few fears are inborn, which means that they are acquired and hence avoidable From this *the child should learn* to face fear directly and not by irrational evasive means, making false excuses, etc Out of it all there is sought to develop in the child a simple technique in meeting real-life fear situations, and in finding 'compensatory adjustments' when effort has been thwarted

"So far as known, this program is without precedent, and so is a belated endeavor systematically and scientifically to banish what has been said for ages to be the hindrance to all virtues But Boston is perhaps the place where such an experiment would have greatest promise of success, for it is the new world capital of the region of 'intellectualized caution'"

TALKING MOVIES

The competition between the silent movies and the talkies is likely to be acute The New York *Times* of April 3rd discusses the fundamental reason for the preference of either the one or the other form and says

"The Hard-of-Hearing Clubs are among the most vigorous partisans of the older kind of screen show If their members are deprived of silent shadows, with occasional captions to give the necessary words, 'one of their greatest sources of pleasure' will be removed.

"It may be that the present vogue of *the talkies* is chiefly due to their novelty, or perhaps, as Mr Nathan says, people are curious to hear their

A Text-book of Surgical Diagnosis Edited by A J Walton, M S., F R C S., B Sc. Two octavo volumes of 1121 pages, illustrated. New York William Wood & Company, 1928. Cloth, $20 00

This work appears as a first edition consisting of two volumes aggregating 1121 pages with a very comprehensive index excellently illustrated by 570 cuts and figures. Every conceivable disease is carefully and thoroughly considered. The various chapters are written by men with wide reputations in that particular branch of surgery The author devotes most of his space to the surgical diseases of the abdominal viscera.

The underlying motive in compiling a work of this character is the tendency of operative treatment to overshadow that of surgical diagnosis. The author feels that it is of more importance to make a correct surgical diagnosis than it is to carry out the technical details of any given operation. He also feels that with a better training in clinical diagnoses much unnecessary laboratory work can be eliminated With these foregoing ideas constantly in mind the work has been logically built up

The reviewer feels that there is a real demand for more reference books of this character, especially for the use of the general practitioner upon whom the patient depends for the proper disposition of his disease To the surgeon particularly in the smaller communities it will fulfill a constantly growing demand

Merrill N Foote

The Care of the Child By Alton Goldbloom, B A., M D 12mo of 240 pages London and New York, Longmans, Green & Company, 1928 Cloth, $1 50

Dr Goldbloom has called his little book "A Guide for Perplexed Mothers," and in it he attempts to answer the type of questions most frequently asked by young mothers Another object has been to divest the minds of parents of the old ideas and common fallacies which have no foundation in fact Dr Goldbloom received his training under the guidance of the late Dr L. Emmett Holt. He is at present, lecturer in Pediatrics at McGill University and has written numerous articles on the care and the upbringing of the child His ideas are in no way revolutionary and he is to be congratulated on their commonsense character

Wm Henry Donnelly

Thrombo-Angiitis Obliterans. Clinical Physiologic and Pathologic Studies By Drs George E Brown and Edgar V Allen 12mo. of 219 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928. Cloth, $3.00.

In the past five years there has been developed a technique for the care of patients suffering from this extremely painful and crippling disease, which radically changes the outlook. Much credit for this accomplishment belongs to the group working at Rochester, who have made good use of the rich material afforded them for study By trying out methods of treatment suggested elsewhere, as well as certain contributions of their own, they have elaborated a system of therapeutic measures which is many times successful in controlling the agonizing pain, and not infrequently in so improving the collateral circulation as to result in the healing of beginning trophic lesions. These measures have been described in various papers, and the present little volume represents a review of the entire subject, historical, pathological, clinical Special methods of investigation, such as the measurement of heat elimination, surface temperature, capillary studies and the intra-arterial injection of opaque media, are briefly described Every internist and surgeon, and this means of course every general practitioner, should be familiar with the main features of the story told by this book.

T H

The Clinical Examination of the Nervous System By G H Monrad-Krohn, M D Fourth Edition 12mo of 209 pages, illustrated. New York, Paul B Hoeber, Inc., 1928 Cloth, $2 50

While serving as an excellent reminder of some of the important points in neurological examinations and interpretations—the book at times seems to be lacking in the completeness of necessary details To those who are desirous of a more complete neurological library, occasional little pointers will be found that make the book well worth its price.

R.

Sterility in Women Diagnosis and Treatment. By Sidney Forsdike, M D Octavo of 133 pages, with 25 illustrations New York, William Wood & Company, 1928 Cloth, $3 50

In reviewing this small volume of 120 pages one is again reminded that a logical arrangement of a monograph on sterility is difficult to achieve Much material that has won a traditional place in other volumes has been wisely omitted The book aims to be practical rather than didactic and seems to outline the author's views modestly and honestly Nearly a quarter of the volume is devoted to the description of tubal patency tests and an interpretation of 'graphs." Although this is well done, we feel that some of this space could have been utilized better is amplifying other diagnostic procedures For instance, the necessity of demonstrating the husband's fertility is emphasized but this feature of sterility study which is frequently the most difficult and the one in which errors in diagnosis are most commonly made by the inexpert receives rather casual consideration Under other important headings, the text is sometimes disappointingly brief, but if the book is completely reviewed it will be found that essential matters have somewhere received attention Operative procedures for the relief of sterility are recommended usually with well-defined reservations. Not all will agree with the author however, in recommending that when other causes of sterility are eliminated the ovaries should be inspected by laparotomy

Wm H Cary

Roentgenology Its Early History Some Basic Physical Principles and the Protective Measures By G W C. Kaye, O B E., M.A., D Sc. 12mo of 157 pages, with 49 illustrations. New York, Paul B Hoeber, Inc., 1928. Cloth, $2 00

This little book of 148 pages of text, 49 illustrations and a very complete index is an elaboration of the Caldwell lecture given by the author in Montreal in September, 1927

As its title states it is a history of the Roentgen rays with the early physics on irradiation which led to the discovery of its rays and a careful study of their nature and physical properties. Over one-half of the book is devoted to the question of protection to the operator and the patient from injury by the X-ray or radium and the appendices A and B, the former comprising the recommendations of the British X-ray and Radium Committee and B the recommendations of the International Congress of Radiology held at Stockholm in 1928, are of special value

Three short paragraphs are devoted to the higher physics of Roentgen rays and while these are of no interest to the average physician, they make for completeness

Every roentgenologist and every physician who is to the slightest extent handling Roentgen rays or radium should add this book to his library not only for his own information but also for the welfare of himself and his patient.

Charles Eastmond

BOOK REVIEWS

A HISTORY OF PATHOLOGY By ESMOND R. LONG, Ph D, M.D 12mo of 291 pages Baltimore, The Williams & Wilkins Company, 1928 Cloth, $5 00

In this small volume, a successful ambitious attempt to briefly summarize the history of pathology has materialized into a highly interesting story Tracing this specialty from earliest times to the present, the author has depicted the high spots of its history in a discriminating manner, particularly emphasizing important events and discoveries Not only is it of historical value, but for the undergraduate, as well as for the physician, it is highly instructive, since only by knowing the development of the science of pathology, can the fundamentals be known Or as Dr Long puts it "Nothing gives a better perspective of the subject, than an appreciation of the steps by which it has reached its present state."

MAX LEDERER

NEUROLOGICAL EXAMINATION An Exposition of Tests with Interpretation of Signs and Symptoms By CHARLES A MCKENDREE, A B, M.D 12mo of 280 pages, illustrated Philadelphia and London, W B Saunders Company, 1928 Cloth, $3.25

This is a splendid reference book of about 260 pages, very concisely written to help in the examination and interpretation of the symptoms and signs of the nervous system It can be highly recommended to every practitioner of medicine R.

ULTRA-VIOLET RADIATION AND ACTINOTHERAPY By ELEANOR H. RUSSELL, M D, and W KERR RUSSELL, M D Third Edition Octavo of 648 pages, illustrated New York, William Wood & Company, 1928 Cloth, $6 50

This third edition of an excellent work reflects graphically the rapid advance which is being made in light therapy The volume is strictly up-to-date, and many new light generators and appliances are described There is a wholesome lack of bias in the description of the various devices and their respective properties and advantages The use of light in the restoration and preservation of health is treated in a masterly and convincing manner The book as a whole is well written and clearly printed, with a profusion of excellent diagrams and photographs It will be a great aid to the advanced user of actinotherapy and a revelation to the student, and can be highly recommended to both.

JEROME WEISS

QUALITATIVE AND VOLUMETRIC ANALYSIS FOR MEDICAL STUDENTS By H LAMBOURNE, M A., M Sc., and J A. MITCHELL, M Sc. 12mo of 64 pages New York, Oxford University Press, 1928 Cloth, $1 50 (Oxford Medical Publications)

This little book, according to the preface, is intended especially for medical students studying for the Pre-Medical Examination of the Conjoint Board

Part I deals with qualitative analysis, and is limited to simple substances containing but one base and one acid This scheme is followed by a few tests for the identification of a few selected organic substances, ten in number It is not, as the title seems to imply, a book on general qualitative analysis

Part II deals with the general principles and calculations of volumetric analysis The descriptions of the processes mentioned are very brief and inadequate for the student without the aid of an instructor

E. H B

METHODS OF BIOLOGICAL ASSAY By J H BURN, M A., M D Octavo of 126 pages, illustrated. New York, Oxford University Press, 1928 Cloth, $2.55 (Oxford Medical Publications)

Director of the Pharmacological Laboratory of the Pharmaceutical Society of Great Britain, previously a member of the Medical Research Council This book contains a description, in detail of the methods of biological assay of digitalis, squills, strophanthus, pituitary extract, insulin, ergot, adrenalin, ovarian extract, parathyroid, thyroid extract, histamine, atropine and antipyretics

The author states in his preface that he has included in this book only methods of which he has had personal experience.

In recent years the manufacturers of certain drugs and their preparations, have adopted the biological method of standardization, or test on animals, as the only test of therapeutic value of these drugs This is done in the interest of therapeutic efficiency, uniformity and safety in dosage, and also, because no chemical method is available in some of them

These methods of assay require trained experts in animal experiment work, and such experts are now employed by all the larger pharmaceutical houses

This book will appeal especially to those engaged in safeguarding the preparation and marketing of these drugs The book is well written and is full enough to serve as a working guide to the standard or official methods to be employed.

The author's discussion of the variability in the reaction of different individuals in series of animals of the same kind, and its bearing on the tests, is of especial interest. This fact makes it possible to fix a standard of potency only by taking the average effect on a very large number of animals It also throws doubt on the accuracy of the application of the biological assay of such drugs as digitalis and associated drugs

Every physician and every dispenser of drugs would do well to read this book and acquaint himself with the methods employed in these assays and their limitations.

E. H B

A HANDBOOK ON VENEREAL DISEASES For Nurses and Others Engaged in the Routine Treatment of These Diseases By W TURNER WARWICK, F R C S 12mo of 221 pages, illustrated London, Faber & Gwyer, Ltd., 1928 Cloth, 6/ net.

This little handbook fulfills a distinct need in the nursing profession. Most available textbooks on the subject are large and unsuited for nurses interested in learning the principles of venereal practice, and of laboratory methods Works of this type seem almost indispensable, inasmuch as the training in most of our larger and recognized institutions provide lectures of but a few hours on the subject The result is a marked lack of interest and ignorance, and a tendency, also, to shun this work or look upon it with contempt.

The nursing profession of the future must be more fully trained in the social diseases, and assume a more responsible role in the management of the most prevalent scourge. In so doing they can uphold the highest traditions of their calling

The author is to be complimented upon the interesting chapter giving the early history The chapter on prophylaxis is also instructive.

It is to be hoped that this book will prove valuable in overcoming a prevalent lack of knowledge and interest, and be utilized extensively by institutions responsible for the proper training of nurses.

AUGUSTUS HARRIS.

"The Night Call"—a reproduction 13¼ x 12" in color from the original suitable for framing will be sent on request

FOR fifteen years this big man in the fur coat has been devoted to the call of service in his chosen profession Fresh and determined from the medical school, he took over the old doctor's practice At first it was said he never could, even in a small measure, compensate the community for its loss when the old doctor passed on But time has proved that he could

The old doctor imparted to the other some of his own wisdom, his own patient philosophy of life and service The younger man, sensitive and a seer in his own right, builded on from his own experience through the practical application of his knowledge of medicine and the personal art of being human and humane

So into his training passed the long discipline of study and preparation, together with that more rigorous responsibility to answer the summons when duty calls, whenever, wherever or for whatever the need may be

He may watch for hours upon end without sleep, eat but little, relax never, yet no one hears him complain No one thinks he ever becomes weary, or longs for a respite and so day or night, in season and out, when the telephone rings a voice carries back, *"This is the doctor Yes, I will come"*

OUR NEIGHBORS

DENVER CITY AND COUNTY MEDICAL SOCIETY

Dr James J Waring, in his president's address before the Denver City and County Medical Society on January 8, 1929, as reported in the April issue of *Colorado Medicine*, discusses the activities of his society, and says

"The Medical Society of the City and County of Denver is now well over fifty years old, a mature, solidly established organization with a roster of 570 members, with amazingly splendid library resources and with a substantial library endowment fund

"In this age of preventive medicine and ever-broadening social responsibilities of men and organizations only a few of the members have taken an active interest individually in public health affairs, and until the past few years officially the society has held aloof and has done little or nothing 'in the advancement of all subjects connected with the healing art and public health'

"During the past year the average attendance at meetings has been ninety-three The chief reasons for this relatively small attendance may be grouped in two categories (1) compulsory hospital staff meetings and subsidiary society meetings, and (2) a monotonous scientific program, by which I mean a program of the same general type repeated over and over again

"Relief from the monotony of the readings of scientific papers should be secured in as many ways as an ingenious program committee can devise

"The opportunity regularly offered at every meeting for the exhibition of patients should be utilized more frequently

"At the present time no organized method exists for securing visiting speakers If the plan for a full time secretary for the State Medical Society goes through it would be very easy for this person to keep in touch with all medical conventions west of us to the end that important guests from the east at these meetings might be extended invitations to stop off in Colorado on their way to the coast or upon their return A careful canvass also should be made of the most desirable men resident west of us, who should be extended on suitable occasions invitations to address our society

"During the past year on half a dozen different occasions all the officers of the society, and all the members of the standing committees and the trustees, and one or two other representative men have been invited to meet with the president at dinner and have spent the entire evening in a well-planned informal discussion of matters of considerable concern to the society Aside from the promotion of good fellowship, the business discussion always frank, always friendly, has been most helpful The conviction grows that this periodic meeting in a social way of all those men in whom the administration of the affairs of the society is temporarily vested promotes frankness and much good feeling, the leaven of which subtly spreads throughout the rank and file of the society there to do its noble work

"The responsibility for the delay in the admission of the state of Colorado into the United States registration area rests largely upon those Denver physicians who fail to make proper returns of births I remind you that the statutes provide for the registration of births and a penalty for failure to report, a penalty, by the way, which has never been enforced by the State Board of Health I also remind you that unless a certain high standard is maintained the state will be dropped from the registration area

"Until convinced of the wisdom and the necessity of reporting venereal diseases and tuberculosis, the members of this society will not do so I suggest that early in the year a meeting be devoted to a discussion of these three important subjects—birth registration and venereal diseases and tuberculosis reporting and that the secretary of the State Board of Health and the manager of health and charity be invited to attend the meeting and to take part in the discussion

"For years only a scant handful of doctors in this community have actively interested themselves in important public health activities and officially the county society has rarely manifested the slightest interest

"It is well known that during the past few years serious misunderstandings have arisen between social service workers and the members of the organized medical profession"

Dr Waring then refers to the 1927 annual report of the Committee on Public Relations of the Medical Society of the State of New York, and quotes the agreements with the voluntary health associations which are printed on pages 622 of the June 1, 1927 issue of the NEW YORK STATE JOURNAL OF MEDICINE In urging the doctors of Denver to take the same action, the president said

"Through the Denver Public Health Council, on which, since its inception four years ago, this society has had two official representatives, the ground has already been prepared for the coordination outlined in these recommendations I believe every health agency represented on the council looks to the county society for authority and

(Continued on page 493—adv xix)

(Continued from page 490)

leadership and is willing, even anxious, to work in harmony with it" (The Denver Health Survey is described in the NEW YORK STATE JOURNAL OF MEDICINE of January 1, 1929, page 58)

Dr Waring also suggested the formation of a Medical Information Bureau after the plan of a similar Bureau of the Medical Society of the County of New York, and the New York Academy of Medicine. (See this JOURNAL of Novemvember 15, 1928, page 1377)

IMPROPER TESTIMONY AGAINST A DEFENDANT PHYSICIAN

A physician in Massachusetts was a witness in a malpractice suit and testified that a bronchitis which came upon the plaintiff some time after an operation was caused by the ether given as an anesthetic The witness was tried by the Board of Trial of the Council of the Massachusetts Medical Society and was adjudged guilty of conduct unworthy of an honorable physician His expulsion from the Society was recommended

Commenting editorially on the case the *New England Journal of Medicine* of February 22 says

"This case is of great interest because of several circumstances First treatment by a reputable physician was adjudged responsible for the ill health of a patient The conclusion reached was the opinion of twelve laymen, later modified by the presiding justice The accused was tried before a group who, in the language of the law, are his peers While the belief exists that the jury system by and large is the most reasonable procedure thus far devised for determining the status of an accused person, physicians may rightfully believe that testimony of a technical nature referring to the medical treatment of a case may not be correctly interpreted by the laity This may, we believe, prevent a logical decision under certain circumstances and if so in this case is most unfortunate A layman may be excused for feeling that, since the decision of the jury was not wholly endorsed and confirmed by the presiding justice, it would be fair to assume that the defendant was entitled to a new trial Second it is unfortunate when a physician called upon to give information to the court submits opinions which are at variance with the general experience and belief of the profession He thereby places himself in the position of one who discredits the practice of medicine as accepted and adopted by the majority He must bear the obliquity which his conduct thereby brings upon himself Third this case seems to justify the feeling that physicians who are not qualified by experience or temperament to meet the trying

The Battle Creek Super Solar Arc Lamp

For Heat, Light and Ultra-violet Therapy

THE new Battle Creek Super Solar Arc Lamp is unique in the field of Phototherapy appliances It is the result of our own 40 years' experience as pioneers in the production of therapeutic arc lamps in this country

Many advanced features of construction make the new Battle Creek Super Solar Arc Lamp noteworthy A snap of the switch starts the arc burning at full power No time is lost in waiting for the rays to attain adequate intensity The lamp being *automatically adjusted by magnetic feed, the largest arc possible* with the given current is always maintained.

A specially constructed adapter is furnished with the lamp It is designed so that the arc does not heat the applicators Any standard quartz applicator may be attached

By giving off rays in both the infra red and ultra violet the Super Solar Arc may be used to successfully treat a wide range of diseases The technic of handling it is easily mastered. Various spectra are instantly obtainable by the use of different carbons

We have recently prepared a new bulletin which describes fully the many advantages of the new Super Solar Arc Lamp May we send you a copy?

Sanitarium & Hospital Equipment Co.
Battle Creek Michigan

Battle Creek Therapeutic Appliances Include

Hydrotherapy Apparatus—Type G 3

The Battle Creek Hydrotherapy Apparatus is constructed throughout of high quality brass The appliance has wall type control and gives jet rain or shower perineal needle spray and Scotch douches.

Electric Light Bath Cabinets

Three models varying in size and cost. Each cabinet complete with special comfort chair and necessary bulbs Made of the finest hard wood water proof cemented veneer

The Battle Creek Radiant Baker

A tested appliance for heat application. The Baker is constructed of aluminum and asbestos and equipped with safety rheostat to prevent excessive heating

The Battle Creek Treatment Photophore

A most efficient appliance for making local applications of heat. It combines the essentials of many expensive therapeutic lamps in one simple effective appliance

FELLOWS' SYRUP

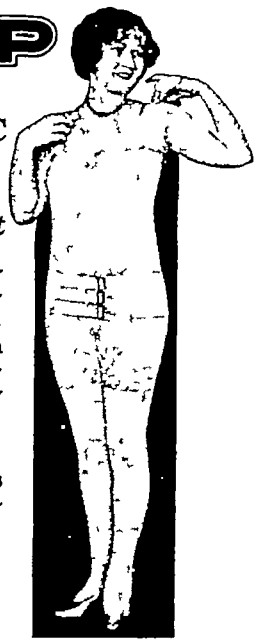
of the Hypophosphites

A concentrated mineral pabulum, possessing unrivalled therapeutic properties in all Wasting Diseases, which have been termed "Demineralizations" by modern clinicians.

Supplies the organism with those indispensable mineral elements:

Manganese Sodium Potassium
Calcium Iron

together with the dynamic action of quinine and strychnine.



Over Half-a-Century of Clinical Experience with FELLOWS' SYRUP has confirmed it as

"THE STANDARD TONIC"

WHEN ON THE ROAD TO RECOVERY

CONVALESCENCE demands the utmost in recuperative power

That is why Horlick's the Original Malted Milk is used with such universally good results when the patient is *on the road to recovery*.

It supplies nutrients most needed for the rebuilding of health and strength By the exclusive Horlick process, these food elements are rendered easily and quickly assimilable For samples, address—HORLICK—Racine, Wis

THE ORIGINAL MALTED MILK
HORLICK'S

(*Continued from page 493—adv xix*)

ordeal of testifying in a legal contest should refrain from giving expert testimony Any fair-minded man ought to be aware of the danger to his own reputation and injustice to others if he flounders in direct and cross examination without adequate intellectual and temperamental equipment

"The profession is confronted with a great burden in the increasing number of malpractice cases and doctors must come to an understanding of the injustice of unsound opinions in court trials Honorable witnesses should take the witness stand devoid of prejudice with a fixed determination to relate facts and express opinions in the strictest possible adherence to truth

"The attorneys are partisans, the doctor should stand as a representative of a profession which is governed by scientific and moral integrity"

PRIVATE FUNDS IN PUBLIC INSTITUTIONS

The acceptance of endowments offered to institutions supported by State or National taxation has frequently been discussed The principle involved is similar to the question whether or not the Medical Society of the State of New York shall accept endowment funds from lay health organizations for the purpose of conducting investigations along public health lines *The New England Journal of Medicine,* in its issue of February 21, discusses editorially a letter appearing in the February second issue of the *Journal of the American Medical Association,* page 411, protesting against a proposed law which would authorize the officers of the Hygienic Laboratory to accept financial contributions for the support of scientific investigations, one of which relates to the standardization of antitoxins and serums The editor says

"We know of no applications of private or public funds which would bring any greater ultimate benefit to the people of the country than the one proposed and we know of no more conscientious administrators of such monies than men of the type that constitute our Public Health Service

"It is therefore, with amazement and, we feel, quite proper resentment that we read in the February issue of the *Journal of the American Medical Association* a communication implying that the acceptance of funds from commercial firms or private foundations would corrupt this Service The correspondent goes so far as to say 'Passage of any of the proposed bills authorizing acceptance of private donations for the United States Public Health Service would amount to turning the United States Public Health Service over to the commercial manufacturers and private foundations'

(*Continued on page 496—adv xxii*)

MEDICAL LEGISLATION IN DELAWARE

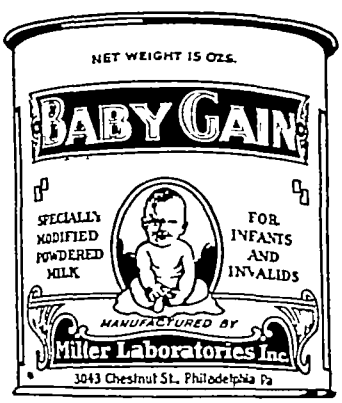
The March issue of the *Delaware State Medical Journal* lists the following legislative bills affecting health

"There is a bill to provide for a state mental hygienic clinic, to be erected in conjunction with the State Hospital at Farnhurst

"There is a bill to provide certain new buildings at the same hospital, all of which are to be part of a comprehensive scheme of expansion, to cost ultimately the very respectable sum of $2,600,000, plus maintenance

"There is a bill to legalize the sexual sterilization of certain classes of criminals, defectives, and epileptics, which bill widens considerably, and perhaps unwisely, the existing bill, which has been operative only for the past five years

"There is a bill to amend the registered nurses' law, providing for an increase, perhaps excessive, in the requirements for admission to a training school for nurses in this State, and also clothing the State Board of Nurses' Examiners with rather dictatorial powers over every hospital in the State that conducts a training school



"Here are four bills of more than ordinary interest and importance to the doctors, yet not one letter has been received by the editor from his medical constituents"

The editor deplores the apparent lack of interest of doctors in medical legislation and says

"Why do doctors not make the *Journal* the open forum it should be for the discussion of Delaware's affairs? Why do they not make use of their opportunity to discuss special local problems?

"To our minds, the keynote of this situation is simply—inertia. Called by its homlier and less poetic name, it is simply laziness—one of the seven deadly sins, an easy one to acquire, and a difficult one to overcome But, surely, when matters of such great import are before the profession as the four items mentioned, the doctors can bestir themselves, give up their habits of hibernation, and engulf the editor with their views"

The March issue of the *Delaware Journal* is only the third number with which the editor has had to deal If he inspires the Delaware doctors to engulf him with their views, he will have done what no other editor of a State Journal can do

Pure Powdered Milk from Tuberculin - Tested Cows

Bottle-fed or Breast-fed Baby

The breast-fed baby receives nourishment of practically unvarying quality BABYGAIN, the scientifically modified powdered milk, enables the mother to prepare bottle feedings with the same characteristic uniformity.

BABY-GAIN requires only the addition of water to provide a diet as easily assimilated as mother's milk This is because the fat globules have been reduced in size and the casein has been broken up in the process of powdering

There is no waste, as the last dram of powder can be used BABYGAIN will prove the most economical food within the correct limits of correct feeding and safety, and may be adapted by the physician to the individual requirements of each case.

Samples and literature supplied to physicians upon request

MILTER LABORATORIES, Inc.

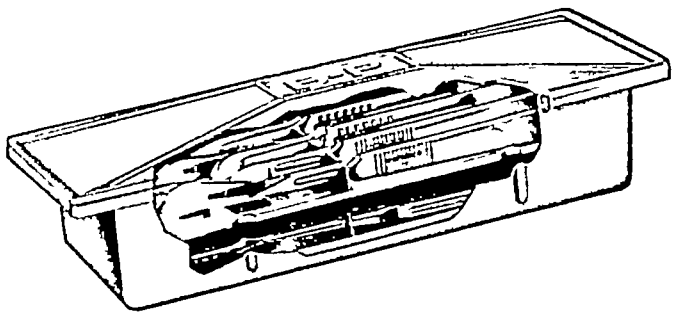
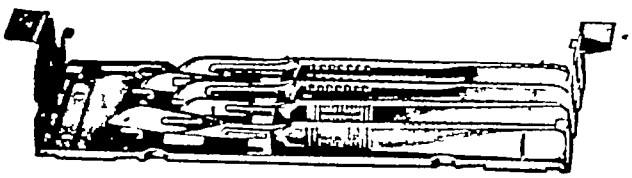
"It seems to us that this statement is entirely unwarranted For a long time just such funds have been accepted by many of our leading colleges and universities with no consequent lowering of their high ethical standards, and that similar contributions to various scientific or welfare societies and other altruistic enterprises have, in the main, been conscientiously administered We, therefore, do not share the correspondent's fear that, with the acceptance of private funds, venality will take the place of the independent and unbiased attitude that has so long characterized the decisions of our federal health authorities, and we heartily and fully support any proper measure which will assist and extend the valuable work of our United States Public Health Service"

EARLY DIAGNOSIS OF TUBERCULOSIS CAMPAIGN IN PENNSYLVANIA



The March issue of the *Pennsylvania Medical Journal* contains the following editorial



"Throughout the field of medicine great emphasis is placed at the present time on early recognition of disease and prompt treatment The National Tuberculosis Association, realizing the great importance of applying this principle in the further reduction of the death rate from tuberculosis, has planned an early-diagnosis campaign for the month of April, to be promoted throughout the United States While the mortality from this disease has reached its lowest ebb during the past year, and while it has been reduced by half within the past fifteen years, yet it is still far too high, being approximately 73 per 100,000

"The plan for this campaign was presented by the Pennsylvania Tuberculosis Society to the Board of Trustees of the Medical Society of the State of Pennsylvania at its meeting in Harrisburg on December 4, 1928, and was given careful consideration It was agreed that the campaign should be approved, and that the Board would urge cooperation in the promotion of the campaign in Pennsylvania on the part of all county medical societies and individual physicians, since "it is clearly recognized that the early discovery and prompt treatment of tuberculosis is a most important consideration in the prevention and control of this disease The Early Diagnosis Campaign being planned by the Pennsylvania Tuberculosis Society is an effort in this direction, and it should have the active support of the medical profession throughout the state

"Special attention is called to the 'Tuberculosis Abstracts' appearing elsewhere in this Journal, also to the article by Dr Charles L Minor which is published in this issue"

BARD - PARKER

STERILIZING CONTAINER

The Bard-Parker Sterilizing Container for hospital and office use is especially designed for the sterilization of Bard-Parker Knives

Material Monel metal which possesses long life and is easily cleaned

Construction Two removable trays with racks for handles and blades

Capacity Eight Bard-Parker Knives with blades attached and space for extra blades

Efficiency The trays may be lifted out of the Container and set on top to drain Knives are ready for use without rehandling

Price Container with two trays (not including knives) $10 00

Write for circular giving complete description of Bard-Parker Sterilizing Container and formaldehyde Germicide

FORMALDEHYDE

GERMICIDE

A powerful, non-corrosive sterilizing medium of high germicidal efficiency prepared especially for sterilizing Bard-Parker Knives and other fine surgical instruments

Bard-Parker formaldehyde Germicide Destroys the most resisting non-spore-bearing bacteria in less than two minutes

Destroys the most resisting spore-bearing bacteria in one and a half hours

Does not injure the keen edge of Bard-Parker blades or other fine steel instruments after two weeks' constant immersion

Prices

One pint bottles	$1 00 each
One carton (12 pints)	10 80
One gallon bottles	5 00 each
One carton (4—1 gal)	18 00

ANTIVIVISECTION ARGUMENTS

The March issue of the *Illinois Medical Journal* devotes six editorial pages to the arguments for and against animal experimentation The article begins

"In Illinois, the District of Columbia and perhaps elsewhere over the country are springing up plans for the introduction by law-making bodies of many bills and other prohibitions forbidding continuance of animal experimentation

"Man's duty toward dumb beasts is one of the inherent truths of civilization, but man's duty to humanity is of such a much greater scope that any criticism of the very small sacrifice of animals necessary to preserve millions of human beings, in fact, the very race itself, is not even a study in comparatives based on the ratio of benefits obtained

"Anti-vivisection defeats the aims it serves. Not only do human beings receive almost incredible assistance from animal experimentation but stockmen and breeders admit that their stock and herds derive incalculable assistance from the results of animal experimentation It is doubtful if the percentage of animals used for research work in this regard, and who thus come to an end different than that which in the due course of nature might be expected to be theirs, in any way approximates the number of physicians and nurses who quietly lay down their lives every year in the discharge of their duties without a whit of agitation as to these 'martyred humans'"

The editor then gives a list of twenty-five diseases and conditions in whose treatment and investigation was made possible by animal experimentation This list is as follows

1 Dog distemper
2 Typhoid fever
3 Diphtheria
4 Smallpox
5 Yellow fever
6 Plague
7 Malaria
8 Lockjaw
9 Hydrophobia
10 Epidemic Cerebro-spinal meningitis
11 Pneumonia
12 Tuberculosis
13 Antiseptic surgery
14 Compound fracture
15 Ovariotomy
16 Post-operative mortality
17 Blood transfusion
18 Goiter
19 Malta Fever
20 Maternity Mortality
21 Syphilis
22 Sleeping sickness
23 Glandular therapy
24 Animal scourges
25 Cancer

It also gives the following lists of investigations conducted largely by animal experimentation

"Animal experimentation has provided vaccine, bacterins, and antitoxic serums, it has aided in the development of new methods of surgery and of reliable means of diagnosing infectious diseases, it taught us how to use gases during the war and how to defend our soldiery against them In the absence of such knowledge the recent war

To THE MEMBERS *of* THE MEDICAL SOCIETY *of* THE STATE OF NEW YORK

WELCOME

YOU are invited to our exhibit in booth No 25 at the Annual Meeting of the Medical Society of the State of New York at Utica, June 3rd to 6th, inclusive

The exhibit will be in charge of William Wallace, Jr, Research Director of the Vitaglass Corporation Reprints of our biological tests and physicists reports of tests made with Vita glass will be available

You will be particularly interested in the test conducted by the Council of Physical Therapy of the American Medical Association and two tests conducted by Captain William D Fleming of the Medical Corps, U S Army, on winter sunlight and skyshine

If for any reason you fail to attend we will be glad to supply you with all of the above mentioned reprints Just write the Vitaglass Corporation, 50 East 42nd Street, New York, N Y, or mail the coupon below

The biological tests made with seasoned Vita glass all indicate that its use will produce anti-rachitic results and normal growth on rats and chickens Some of these tests have been carried on during winter months and in large cities

There are two ways to test the transmission of health window glass—the physical method and the biological methods One method demonstrates the quantity and the other both the quantity and quality of transmission

Vita glass has been subjected to accelerated weathering tests many times by the Bureau of Standards, Professor Stockbarger of Massachusetts Institute of Technology and many other physicists These physicists all confirm that the solarization (weathering or seasoning) of Vita glass takes place very quickly and that within a few weeks in actual use its transmission of the health ultra-violet becomes stable and permanent *without further* change

(*Continued from page 498—adv xxiv*)

would have cost additional thousands of lives and would have produced many additional thousands of cripples

"Animal experimentation has resulted in the following basic knowledge Circulation of the blood, capillary circulation, the vasomotor mechanism, functions of the nervous system, the flow of chyle in the lacteals, the passage of chyle through the lymph ducts into the venous circulation, the nature of the digestive fluids and chemical transformation of food through their action, functions of the liver, lungs, kidneys, and other organs, the reaction of the cells to various kinds of stimuli, significance of the endocrin glands, nature of inflammation and other pathological processes, and numerous other discoveries in physiology, pathology, and biochemistry

"Experiments with live stock have contributed richly to the current knowledge of drugs and their uses and to the precise information we have of the therapeutic, physiologic, and toxic actions of the innumerable substances from which our useful drugs have been selected"

The editorial also gives the following sins of omission, to be credited to the anti-vivisectionists

"1 Not a single life has been saved by efforts of antivivisectionists

"2 Not a single beneficent discovery has been made by them

"3 Not a single disease has been abated or destroyed or cured by them, either in animals or in man

"4 All that they have done is to resist progress —to spend $500,000 in thirty years in Great Britain alone, and millions in the United States and elsewhere, and to conduct a campaign of abuse and gross misrepresentation, from which the harvest is easy to prognosticate from present results

"5 They care apparently little or nothing for the continued suffering and death of human beings, or the grief and not seldom the ensuing poverty of their families, provided that twenty-six out of every thousand dogs and cats, monkeys and guinea pigs, mice and frogs experimented on shall escape some imaginary physical suffering Somehow, antivivisectionists fail to appreciate the fact that millions of animals are spared much suffering as result of animal experimentation

"6 They insist, therefore, that all experimental research on animals shall stop and—astounding cruelty—that thousands of human beings shall continue year after year to suffer and to die, to become invalided and often not only burdens to themselves but economic liabilities to the community, their families and society

"One horse furnishes antitoxin which saves thousands of human lives—and the horse continues to live with more comfort and better care than many humans about whom antivivisectionists do not worry"

MUTUAL PHARMACAL CO., Inc

LEGISLATION IN COLORADO

The problems of Medical Legislation are the same throughout the United States The March issue of *Colorado Medicine* has the following editorial deploring the indifference of doctors toward legislative bills

"Special attention is called to the faithful efforts of Senator Alfred J Linnger, D D S, and Representative E J Brady, M D, chairman of the Medical Affairs Committees of the Senate and House It is deplorable that only county societies and very few individual physicians have informed these gentlemen of their stand on the above measures They are exceedingly anxious to deal justly with their professional constituents but how can they always do this if we continue silent and indifferent Better than informing these gentlemen who are our loyal friends, we should write other members of the Legislature to whom approach would be natural and personal influence effective"

The physicians of New York State have discovered that doctors can do their most efficient legislative work by getting their influential friends to write to the legislators for or against a bill, to a legislator an opinion of a storekeeper or lawyer on medical legislation is a hundred times more potent than the arguments of a physician

ADVERTISING CO-OPERATION

Editors of medical journals frequently print explanations of the value of advertisements to their periodicals It seems a trifle strange that any apology should be required for the acceptance of business advertisements, but then, doctors are usually considered to be poor business men However, the fact remains that advertisements benefit both the medical journals and the advertisers

Cooperation of physicians and advertisers is discussed in the following editorial in the March issue of the *Kentucky Medical Journal*

"Of course we know that our readers are utilizing our advertising columns every day We know this because we are constantly coming in contact with grateful physicians who are telling us about it However, our advertisers do not know this The address given at the bottom of practically every advertisement is an exclusive address used for this Journal alone We want to request every reader of this editorial to look through the advertising pages of each issue and write to the advertiser for samples, catalogues or whatever he has to offer, if you are interested in his product

The advertisers pay for the publication of the Journal Every dollar received from them is spent for making a bigger and better Journal It would cost each of our readers about $8 00 a year to publish this Journal if it were not for the advertisers"

REGISTRATION IN COLORADO

The annual registration of physicians is a source of dispute in Colorado as well as New York, as is seen by the following item in the March issue of *Colorado Medicine*

"House Bill No 42 provides for the annual registration of all who practice the healing art within the state The bill has been temporarily retired to the Committee on Medical Affairs because some of the legislators favored a tax of ten dollars for purposes of revenue The proponents of the measure preferred to retire the bill rather than to submit the profession to such unjust class taxation. The bill as originally proposed provided for an annual fee of five dollars for the purpose of administering the law The sister bill for annual registration of dentists proposes two dollars as an adequate fee States where annual registration of physicians is required, provide for fees as follows California, reduced from two dollars to one dollar, Connecticut, two dollars, Florida, one dollar, Minnesota, five dollars reduced to two dollars, Nebraska, one dollar, Oregon, five dollars, New York, two dollars"

DIABETIC DIET READJUSTMENTS

Some foods cannot be allowed in diabetic diet at all and others only sparingly This means a readjustment in dietary habits that is difficult for the patient and trying for the physician Practically all of the restricted foods may be duplicated by using Lister's Flour Each of these starch and sugar-free foods looks and tastes like the food that it replaces in the diet With the variety of foods, possible through the use of Lister's Flour, the patient is satisfied. There is no temptation to "cheat" and the case is the better kept under control Some of the Lister foods are

Bread, Biscuits, Cheese Biscuits, Lunch Biscuits, Drop Cakes, Cookies, Spice Cake, Charlotte Russe, Lady Fingers, Bread Pudding, "White" Bread, Nut Bread, Spiced Bread, Gold Cake, Pie Crust, Pie Fillings, Filled Doughnuts, Meringue, Muffins, Pancakes, Waffles, Salmon Croquettes, Fried Noodles, Fluff Cakes, Breadsticks, Doughnuts, French Toast, Spiced Muffins —Advertising page 1 —*Adv*

SEDGWICK INVALID ELEVATOR

Many physicians and surgeons have displayed interest in the development of an absolutely safe and easily operated invalid elevator, not prohibitive in cost, that would eliminate stair-climbing for those patients weakened by illness or age. To this end the Sedgwick Hand Power Automatic Brake Invalid Elevator was perfected and has been unanimously endorsed by its users and their medical advisers See advertisement page xxviii —*Adv*

When it is used in an emergency, you cannot take a chance on a product of low or varying potency

You can place absolute confidence in the unvarying standard of the Digitalis supplied by Upsher Smith

The name indicates a Digitalis grown, harvested, and produced under the direct supervision of a specialist who has given a lifetime to the study of this product

This experience is applied to producing a Digitalis upon which the physician can pin his faith

The leaves are cut at the time of maximum potency, cured rapidly to avoid decomposition, winnowed from dust, stalk, midrib, and dead leaves, and, finally, biologically standardized according to the Hatcher Cat Unit Method, thus keeping it uniformly standard as in the past ten years

In this way, a definite standard of potency is assured and an accurate dosage supplied in terms of the number of cat units per pound of body weight. See page xv—*Adv*

HORLICK'S MILK MODIFIER

Horlick's Milk Modifier, a new product made by the Horlick's Malted Milk Corporation, Racine, Wisconsin, is now being introduced to the medical profession This maltose and dextrin product, which is derived exclusively from malted grains, was first announced at the annual meeting of the American Medical Association in Washington, D C, in June, and created much interest Since that time it has been presented to convention gatherings in other parts of the country See page xx—*Adv*

NEW YORK STATE JOURNAL of MEDICINE

PUBLISHED BY THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Vol 29, No 9 NEW YORK, N Y May 1, 1929

MEDICAL SOCIETY OF THE STATE OF NEW YORK ANNUAL REPORTS, 1929

REPORT OF THE PRESIDENT

To the House of Delegates—

Gentlemen

Another year of Society activities has passed swiftly and quietly by, revealing in its course of events certain points of interest to us as individuals and as an organization

The net results of these activities have been

(1) To improve the professional and material welfare of our members,

(2) To increase the value of the medical profession to the community, and

(3) To make the machinery of our organization more efficient

These activities have been roughly tabulated in this report for your greater convenience but will be reported in greater detail by the various officers concerned

((1) To improve the professional and material welfare

(a) The County Medical Society is the foundation upon which our State Society is built, therefore, the best interests of the State Society are conserved by aiding the County organization in every way possible

We have been privileged to be of service to certain County Societies by assisting in the preparation of their programs, by attending some of their meetings and helping to awaken the interest of the members, by assisting them in propaganda concerning community activities such as the establishment of hospitals, County Health Departments, etc, and by taking part in the discussion of economic problems which differ somewhat in different sections of the State but still have points of common interest

Attentive thought and assistance to County Societies is reflected in greater enthusiasm of the members for Society work and greater Society influence in the community and also in a more cohesive and coherent State Society

(b) The District Branch Meetings are another valuable point of contact between the State Society and its component parts They permit of much more intimate acquaintance with the individual members of the various sections of the State and the problems peculiar to those sections than is possible to acquire at the Annual Meeting of the State Society It is interesting to note that the total number in attendance at the District Branch Meetings is greater than the number in attendance at the Annual Meeting of the State Society

The District Branch Meetings are increasing their usefulness and influence each year and are invaluable factors in the maintenance and improvement of the morale of our members

Of all the pleasant official contacts enjoyed during the past year the District Branch Meetings stand pre-eminent and that seemed to be the opinion of all those in attendance

The limits of their possibilities have not yet been reached and they deserve and they will well repay continued encouragement and assistance

(c) One of the most practical and appreciated activities of the State Society is the Post-Graduate courses instituted a few years ago

These courses have expanded in response to demand until at present a course of lectures and clinics can be furnished in almost any field of medical practice

They have established themselves as a major activity of the State Society and no one can compute their value to the medical profession of the State and indirectly to the general public but some way should be devised to lessen the financial burden of the State Society

(d) Our State Society has long been recognized as a pioneer in the establishment of appropriate standards of excellence (requirements) for those who would study medicine, for the graduate in medicine and for his licensure but there has always been a serious defect in our system of standards

This defect has been responsible for the infliction of many an injustice on the public and

WANTED SALARIED APPOINTMENTS EVERYWHERE for Class A Physicians Let us put you in touch with investigated candidates for your opening No charge to employers. Established 1896 AZNOE SERVICE is National, Superior AZNOE'S NATIONAL PHYSICIANS' EXCHANGE, 30 North Michigan, Chicago.

We have inaugurated a courtesy service for travelers including information regarding itineraries, visas, passports, purchase of tickets, hotel reservations, etc. Individual service rendered Write or phone A. A Wiedenbeck, Dun Camp's, 1 Broadway, New York Telephone Whitehall 8758

POSITION WANTED—Registered, 34 years experience, Skilled all modalities. Part time work physician's office Lindgren. Tel. Flushing 1556

IDEAL LOCATION FOR SALE for building Sanitarium or hospital Will sell any number of acres up to 100 On State Road, altitude 2,140 feet, electricity, pure water, coal mines nearby Highest point on Susquehanna Trail. For particulars, write Mrs. R. P Douglass, Mountain View Inn, Blossburg, Pa

DIABETIC DIET READJUSTMENTS

Some foods cannot be allowed in diabetic diet at all and others only sparingly This means a readjustment in dietary habits that is difficult for the patient and trying for the physician Practically all of the restricted foods may be duplicated by using Lister's Flour Each of these starch and sugar-free foods looks and tastes like the food that it replaces in the diet. With the variety of foods, possible through the use of Lister's Flour, the patient is satisfied There is no temptation to "cheat" and the case is the better kept under control Some of the Lister foods are

Bread, Biscuits, Cheese Biscuits, Lunch Biscuits, Drop Cakes, Cookies, Spice Cake, Charlotte Russe, Lady Fingers, Bread Pudding, "White" Bread, Nut Bread, Spiced Bread, Gold Cake, Pie Crust, Pie Fillings, Filled Doughnuts, Meringue, Muffins, Pancakes, Waffles, Salmon Croquettes, Fried Noodles, Fluff Cakes, Breadsticks, Doughnuts, French Toast, Spiced Muffins —Advertising page 1—*Adv*

SEDGWICK INVALID ELEVATOR

Many physicians and surgeons have displayed interest in the development of an absolutely safe and easily operated invalid elevator, not prohibitive in cost, that would eliminate stair-climbing for those patients weakened by illness or age To this end the Sedgwick Hand Power Automatic Brake Invalid Elevator was perfected and has been unanimously endorsed by its users and their medical advisers See advertisement page xxviii—*Adv*

FREE MEMBERSHIP OFFER

Nelson Loose-Leaf Surgery offers a practical system of treatment for both General Practitioner and Specialist, by the Medical Authorities of the world, kept continually up-to-date with the Nelson Loose-Leaf Binding Device.

Free membership in the Nelson Research Service Bureau for Scientific and Medical information, which furnishes you with all the information obtainable upon any subject in medicine.

Annual Surveys and the Literature edited by the leading physicians of America. Six thousand (6,000) articles are abstracted yearly from all the important medical journals of the world by our special staff of reviewers An Editorial Board of 67 of the foremost physicians in America then critically select from these and edit with comment all that is of value and that signifies an advance. This great service keeps every subscriber fully informed of the world's medical progress This is the only service of its kind

CALIDAIR

A modern treatment giving prompt relief in coryza, bronchitis, laryngitis, hay fever and asthma, promoting unbroken sleep Sold to the public on prescription only New York State Distributors The Jeffrey Fell Co, 318 Pearl Street, Buffalo, George Tiemann & Co, 107 East 28th St, New York Write for booklet to R W Cramer & Co, Inc, 136 Liberty Street, New York See advertisement on page xiii—*Adv*

VITA GLASS BRINGS THE SUN INDOORS

Vita glass has been subjected to accelerated weathering tests many times by the Bureau of Standards, Professor Stockbarger of Massachusetts Institute of Technology and many other physicists These physicists all confirm that the solarization (weathering or seasoning) of Vita glass takes place very quickly and that within a few weeks in actual use its transmission of the health ultra-violet becomes stable and permanent without further change

The biological tests made with seasoned Vita glass all indicate that its use will produce anti-rachitic results and normal growth on rats and chickens Some of these tests have been carried on during winter months and in large cities

There are two ways to rest the transmission of health window glass—the physical method and the biological methods One method demonstrates the quantity and the other both the quantity and quality of transmission See page xxvii—*Adv*

"CLANDOWIE"

The wonderful home of the McClintocks situated high on a bench of the Catskills at Andes, N Y is to be open after April 15th as a Convalescent and Rest Home

"Clandowie" has been for years one of the show places of Delaware County and is splendidly arranged for the purpose intended The rooms are large, elaborately furnished, and every comfort and convenience has been studied for the care of its people.

The kitchen is electrically equipped, and an expert dietician is in charge. Tested Jersey cows furnish all the milk and cream essential, and pedigreed Barred Rock fowls keep the house supplied with fresh eggs Pure spring water at the taps, for bath and drinking purposes

This splendid home, with every convenience that can be obtained in any city home, is to be placed at the disposal of the profession for the comfort of the people that need quiet, the bracing mountain air, and good nourishing food.

It will be under the ethical supervision of Dr Gordon B Maurer and Dr William M Thompson.

All communications may be addressed to "Clandowie" Convalescent Home, Andes, N Y See page xxxi—*Adv*

DIGITALIS

There must be no guess work when using a potent preparation like Digitalis.

When it is used in an emergency, you cannot take a chance on a product of low or varying potency

You can place absolute confidence in the unvarying standard of the Digitalis supplied by Upsher Smith

The name indicates a Digitalis grown, harvested, and produced under the direct supervision of a specialist who has given a lifetime to the study of this product.

This experience is applied to producing a Digitalis upon which the physician can pin his faith

The leaves are cut at the time of maximum potency, cured rapidly to avoid decomposition, winnowed from dust, stalk, midrib, and dead leaves, and, finally, biologically standardized according to the Hatcher Cat Unit Method, thus keeping it uniformly standard as in the past ten years

In this way, a definite standard of potency is assured and an accurate dosage supplied in terms of the number of cat units per pound of body weight. See page xv—*Adv*

HORLICK'S MILK MODIFIER

Horlick's Milk Modifier, a new product made by the Horlick's Malted Milk Corporation, Racine, Wisconsin, is now being introduced to the medical profession This maltose and dextrin product, which is derived exclusively from malted grains, was first announced at the annual meeting of the American Medical Association in Washington, D C, in June, and created much interest Since that time it has been presented to convention gatherings in other parts of the country See page xx—*Adv*

(3) To make the machinery of our organization more efficient

(a) Our State Society is a loose federation of sixty autonomous units with nearly that many opinions on certain matters

The Power of the State Society is only that which is granted to it by these autonomous units

It therefore becomes necessary to secure the closest possible cooperation between the State and County Societies

With that end in view each County Society is urged to adopt an organization paralleling that of the State Society.

This plan would expedite the work of the Society and distribute the various activities more widely throughout the membership, an excellent method of stimulating Society interest and improving the morale of the members

(b) An annual conference of the secretaries of the County Societies would make for more united effort in any State activity as well as stimulate a friendly rivalry between them At present there is nothing of the sort and this lack of competitive effort in County Society activities is largely responsible for the inertia that is so frequently found

The County Societies are also recommended to make use of the Biographic Bureau of the American Medical Association when considering the names of applicants for membership

(c) One of the most potent factors in securing respect for an organization and making its influence more impressive is financial solvency and solidarity

Much vicious legislation and destructive criticism would be check-mated by a well-filled war chest which would also keep our credit good in the commercial world

Our Treasurer and Board of Trustees have instituted a financial system which in a comparatively few years will make some of our departments self-supporting and make our Society as strong as Gibraltar

This well-considered plan to secure this much-to-be-desired result is worthy of your sincerest commendation

To recapitulate

I would recommend—

(a) The establishment of an Annual Conference of the Secretaries of the County Societies

(b) The approval of the Tri-State Conference and the inclusion of some definite amount in the budget for carrying on the work.

(c) That the Medical Society of the State of New York suggests to the hospitals of the State that they modify their regulations to make it possible for physicians or surgeons to accept fees from official or voluntary health agencies for professional services rendered indigent persons coming under the care of those agencies

(d) That the Medical Society of the State of New York memorialize the Regents of the University of the State of New York to establish some method for the legal certification of specialists

(e) The consideration of the advisability of making the Post-Graduate Courses self-supporting

May I take this opportunity to express my sincerest appreciation for the evidence of the trust you have reposed in me and to thank you for the many kindnesses and encouragements I have received from you

Respectfully submitted,

HARRY R TRICK, *President*

April 15, 1929

REPORT OF THE SECRETARY

To the House of Delegates—

Gentlemen

Your Secretary has the honor of submitting the following annual report

THE SOCIETY IN GENERAL

In his last report the Secretary laid stress on the increase of interest and enthusiasm manifested by the members in the various activities of the Society and upon the harmonious correlation existing between the respective subsidiary bodies responsible for the carrying on of the work

This year has shown the result of this cooperation in many ways and has proven that the growth is one of health and vigor, promising well for the future of the Society and lessening the burdens and problems of those into whose hands the responsibility of coming years may fall

In this regard especial mention may be made of the work of the Committee on Public Health and Medical Education under the chairmanship of Dr Farmer and of that of the Committee on Public Relations under the leadership of Dr Sadlier, Chairman, and Dr Ross, Secretary The latter Committee has fully justified the action of the House in establishing it as a standing committee and the thanks of the Society are due Dr Sadlier who has shown his loyalty and his devotion to the welfare of the profession and of organized medicine by stepping out of the Presidency into the chairmanship of a committee Of such timber are our Presidents made

Our President of this year has proven himself a worthy successor of his distinguished predecessor Sacrificing practice, self-interest, and personal comfort he has thrown himself into the work with energy and enthusiasm, shirking no task as too difficult and considering none too insignificant Dr Trick has shown himself to be a

consists of an utter lack of legal standards for the specialists

This fault or defect is becoming more and more apparent with the rapid increase of specialism in modern medicine and should receive your thoughtful consideration

(e) The material welfare of the profession is the particular concern of the Committee on Medical Economics That committee has labored assiduously for years endeavoring to adapt the practice of medicine to the changing social and economic conditions under which we live

Periodic Health Examination is a big step in the direction of preventive medicine and will some day represent a large part of a physician's work but the idea still needs much educational work both among the profession and the public

This committee has finally secured recognition and support from official and lay organizations in its effort to incorporate a medical advisory board in the Department of Labor but "the mills of the gods grind slowly" However, success is just around the corner and when it is attained the work of the physician under the Workmen's Compensation Law will be much pleasanter

(f) It is a duty of the State Society to keep informed regarding the distribution of the profession and to attempt to correct the conditions that brought about either an overcrowding or an insufficient number to meet the needs of the public In other words, the State Society might well maintain a bureau to act as a clearing-house for the public and professional needs

Our Executive Officer has completed a most interesting survey of the State, outside of New York City, which will be published soon and will furnish some startling facts in regard to the ratio of physicians to population

It appears that the lack of hospital facilities is often responsible for the lack of physicians in certain localities and our Public Relations Committee has some gratifying comments to make on what has been accomplished to improve such conditions

The work of the Legislative Committee is seldom spectacular but is always arduous Our experience in the last session of the Legislature was not all we could have desired but nobody got all they wanted, not even the Governor, so we might find some comfort in the thought that we fared as well as anybody else

(2) To increase the usefulness of the profession to the community

(a) The general public quite properly looks to the medical profession for information and advice concerning all matters relating to their health and well-being—not only for the cure of disease but for its prevention, as well

It is physically impossible for the medical profession to cover all these various fields of public health work We are too busy caring for the sick to give much personal attention to strictly public health activities but we owe it to ourselves as well as to the community to assist the official and voluntary health agencies with our suggestions and advice

It has been to our advantage and the extension of our influence to sit in with the executives of the official and lay health agencies in an advisory or ex-officio capacity and I would recommend a continuation if not an elaboration of that idea Here again, our Public Relations Committee is our liaison group

Our material welfare is intimately wrapped up in Public Health work and should be discussed with the various groups concerned when considering the plan of procedure in any public health campaign, not after the campaign has been instituted

Each of us does a certain amount of gratuitous professional work for our own peace of mind but when we do the work for others we should be paid for it

I am glad to report that all the official and voluntary health agencies with which I have conferred are willing and glad to pay physicians for their professional services

More work of this sort would be paid for if the regulations of certain hospitals did not prevent the attending physician or surgeon from accepting fees for professional services rendered to those patients which happen to be in the wards, although those same patients are under the care of a philanthropic group—which often has plenty of money to pay for whatever services the patient may need

Could we induce such hospitals to modify their regulations to the extent of meeting such contingencies?

(b) Several years ago certain officers of the Medical Societies of New Jersey, Pennsylvania and New York formulated a tentative organization which later came to be known as the Tri-State Conference

These three States by reason of their location, contiguity and character, largely industrial, have many interests and problems in common which might better be solved in unison, if not similarly, to the advantage of the public and the medical profession

The action taken by these three State Societies is watched with a great deal of interest by other State Societies because they represent a large segment of the Federal population and about one-fifth of the medical profession of the United States

The Tri-State Conference, therefore, represents a large potential force as well as a valuable means of exchanging ideas

These facts are called to your attention with the hope that the Tri-State Conference may be established as a recognized form of our State Society activities

Work being an exception Nor has he been privileged to read many monthly reports, the Committee on Public Health and Medical Education being the only one to comply regularly with the rule of the Executive Committee requiring such report

Despite this handicap, he has the temerity to respectfully urge that the Committee on Public Health and Medical Education be relieved of a portion of its heavy burdens by relegating those concerning public health matters to the Committee on Public Relations or, in case that Committee is over-burdened, by establishing a standing committee on Public Health

In these days of vast economic problems in all walks of life, the economic phase of the practice of medicine should receive careful consideration and study, particularly in regard to its importance to organized medicine and the profession and to its influences on the welfare of the individual practitioner To this end, it is urged that the work of the Committee on Medical Economics be greatly broadened.

District Branches and Conferences

The Secretary has followed established custom and visited the Annual Meetings of the District Branches with the exception of two which fell on dates requiring his presence elsewhere He regrets this enforced absence as in every instance he has obtained knowledge and benefited by attendance on these meetings The meetings were well attended and the scientific programs excellent Year by year these meetings become of more and more importance to the Society and every effort should be made to continue and support them

The Annual Conference of State Secretaries and Editors held in Chicago by the American Medical Association was attended by the Editor, the Executive Editor and the Secretary, all of whom took part in the proceedings

The worth of a conference depends on three elements the reason for holding it, the manner of its conduct and the ultimate results obtained In the conferences of County Secretaries all these have been well worthy of favorable consideration The intimate personal touch, the interchange of views and experiences and the study of analagous subjects contribute greatly to stimulating the interest of secretaries in their work and in the State Society To quote from the Presidential address of Dr Van Etten, "A County Society is just as strong as its Secretary" The continuance of these conferences is earnestly urged

The Secretary has not attended the Tri-State Conferences

The Executive Officer

To the Executive Officer, the Secretary extends his thanks for his many acts of courtesy and assistance and also his appreciation of the legislative and general work done by him

To assist the Committee on Public Relations and enhance the value of its work to the Society, there is need of a Field Secretary, one who could intelligently represent the Committee throughout the State Dr Lawrence's experience and knowledge of welfare and charity organizations, of health boards and state departments, peculiarly fit him for such duties, and the Secretary is of the opinion that the assigning of specific duties would be of benefit both to the Executive Officer and the Society

Membership Statistics

		11,247
Members elected after October 1, 1928 and credited to 1929		229
Membership January 1, 1929		11,476

The list of honor counties whose membership shows all dues paid for the year is as follows Cattaraugus, Chenango, Clinton, Columbia, Dutchess, Essex, Fulton, Genesee, Ontario, Rockland, Schoharie, Schuyler, Tompkins, Washington, Wyoming

In closing, there is one thought which the Secretary wishes to leave with the House and with the Membership On all hands we hear that these are perilous times for the medical profession and that organized medicine is on trial If this is true, and no one doubts but that in a measure it is, it is absolutely necessary that the State Society assume the leadership in all movements, presenting a strong aggressive front, with firm solidarity in the ranks and allowing no action or expression of opinion to mar the harmony now existing

Respectfully submitted,

D S DOUGHERTY, *Secretary*

April 15, 1929

President of excellent judgment, of untiring zeal and courteous and dignified demeanor—a man and a friend

When the gavel falls to open the House of Delegates, a strange feeling will prevail in the hearts of those who have sat in the House for years past, "a feeling of sadness and sorrow that is not akin to pain" for we know that our Speaker Emeritus is with us in heart and mind and is absent only officially Ever since the office of Speaker of the House was created that sterling gentleman, able parliamentarian, strict enforcer of order and genial comrade, Dr E Eliot Harris, has sat in the Chair and presided over our deliberations Last year, ill health compelled him to refuse reelection and the House reluctantly bowed to his decision In expressing our regrets we may also express our thankfulness that his mantle has fallen upon the shoulders of an able and worthy successor, Dr John A Card

For three years the Secretary has called attention with intended constructive criticism to many flaws in the operating machinery of the organization These flaws have disappeared to such an extent that those remaining are not worthy of mention No longer can the intelligent observer comment on looseness of construction or of administration They may not be said to be perfect but perfection is merely a relative term and can be used here only as comparative The further construction that may be needed should be attained only through the slow process of evolution

The Society's Office

Here may exist some of the needs for betterment but they are only such as may be remedied by time and slight expenditures To praise ones own department may be to invite a suspicion of egotism and self-praise but the Secretary feels that he can be justly proud of the offices, their equipment, the efficient, faithful and untiring manager and the able, willing and obliging corps of assistants He highly appreciates their personality and work and takes pleasure in publicly expressing his thanks to Miss Baldwin

Last year attention was called to the urgent need of an additional room in which may be held the meetings of the Council, Executive Committee and other bodies which today are meeting in the general office to the detriment of the work and the discomfort of the staff At each meeting five of these girls have to leave their desks, books and typewriters and congregate idly in the small back office The attention of the Trustees is respectfully called to this matter and to the facts that several times rooms have had to be hired temporarily and that the New York Academy of Medicine is about to build additional room space

The Secretary's office still acts as a mailing and distributing department for the JOURNAL and continues to handle the make-up and publication of the Directory, no change should be made at present in these arrangements

Your Secretary is still of the opinion that any plan of joint publication of the Directory is impracticable and inadvisable

Financial Department

Again opportunity is taken to congratulate the Society upon the state of its finances and the sound basis upon which the Board of Trustees and the Treasurer have placed them, also to reiterate former statements regarding the importance and benefit of these officers to the body economic

In all organizations will be found a wide divergence of opinion as to the proper disposition of funds, on one extreme are to be found those who fail to discriminate between liberal spending and extravagance and on the other those who cannot differentiate saving from hoarding Midway walk those who, like our Trustees, pursue the even tenor of a path in which no appropriation for the proper management and progress of the organization is overlooked, but in which lavish distribution of monies cannot flourish The Trustees are all men of business instinct and training and the Treasurer is possessed of keen financial insight Under such guidance, the treasury is safely guarded without any display of parsimony or neglect This is said advisedly by one who sits with the Board as Secretary and with the Business Committee as Secretary and Executive

The Legal and Insurance Departments

Between the Secretary's office and that of the Legal Counsel exists an intimate relationship of importance to the Society All applications for malpractice defense are endorsed by the Secretary and on the other hand all communications, which might tend in even the slightest way, to involve the Society in legal entanglements are submitted to the Counsel for approval No document of a semi-legal character is signed until it has received such approval Many are the questions of advise asked over the telephone and always answered with courteous willingness The Society and its Officers are fortunate in having as Counselor and friend, Lloyd P Stryker

The Group Insurance Plan does not seem to be as generally understood as it should be Not a week goes by without a letter or a telephone call asking information regarding it. The members are earnestly urged to read the report of Drs Card and Heyd published in the October 15th, 1928 number of the JOURNAL

Committees

Although according to the By-Laws, the Secretary is by virtue of his office a member of all standing committees he has received notices of but few meetings, the Committee on Scientific

efficient carrying on of the business of the Society, acting on reports of committees and regulating their work, appointing necessary special committees, considering expenditures and applications for appropriations and transmitting those endorsed to the Trustees for their approval

Mention may be made of the following actions The appointment of James N Vander Veer, John A. Card and Orrin S Wightman as a Special Committee in charge of the general arrangements at the Annual Meeting, the appointment of the Standing Committee on Arrangements, Hyzer W Jones, Chairman, George M Fisher, Andrew Sloan, Edward R Evans, Thomas H Farrell, T Wood Clark, Joseph L Golly, F M Miller, and William Hale, Jr , of the Committee on Prize Essays, Arthur J Bedell, Thomas H Curtin and John E Jennings, of the Committee on Medical Economics, C Ward Crampton, Morris G Rosenthal, H P Hourigan and Homer J Knickerbocker, and of a Special Committee on Group Insurance, John A Card, and Charles Gordon Heyd.

The place and date of the Annual Meeting were considered and Utica and the 3rd, 4th, 5th of June selected

The report of the Special Committee on Budget was received and recommended to the Board of Trustees for approval

An extremely important opinion was rendered as follows It is the opinion of the Executive Committee of the Council of the Medical Society of the State of New York that medical publicity is that which is educational and deals with the medical profession in its entirety—whereas medical advertising appertains to that medical publicity which deals with the individual and may be used to his or her personal advantage

The Committee on Publication

The *New York State Journal of Medicine* is the principal means by which physicians learn of the accomplishments, policies, and aspirations of the State Society and its component County Societies The JOURNAL is published under the auspices of a Committee on Publication appointed by the Executive Committee under the authority of the By-laws of the State Society

Organization The JOURNAL was managed as a part of the routine work of the Secretary's office until January 1, 1924, when a full-time Executive Editor was employed A separate office and an executive staff were established in November, 1927, when the Society moved into the new building of the New York Academy of Medicine at 2 East 103rd Street, New York The JOURNAL now has its own rooms and a full-time staff consisting of an executive editor, two expert clerical assistants, and an advertising manager, but the secretary's office still collects the advertising bills and makes out the mailing lists

The Editor-in-Chief takes an active part in getting out every issue of the JOURNAL. Every editorial and every report of meetings involving a statement of policy of the State Society is submitted to him for reading and approval, and also to the Committee on Publication The Committee on Publication believes that the JOURNAL closely represents its constituents

Departments The JOURNAL has undergone a progressive evolution during the five years since it was reorganized with a full-time staff, when the policy of departmenting the JOURNAL was begun Some departments have been dropped owing to lack of support, and others have been added as occasion demanded The JOURNAL is now divided into eleven distinct departments, each beginning with a box heading at the top of the page

Number of pages in each department of the New York State Journal of Medicine during the last five years

Interpretative Reporting Special attention is called to the News Department The Committee on Publication has adhered to the policy that the items shall be on the activities of the medical societies of the State, the District Branches, and the Counties The value of these items is permanent, in contrast with the ephemeral value of the items which are merely personal or local

The Committee on Publication reiterates the distinction between "reporting" and "editing" The easiest form of reporting a conference is that of hiring a stenographer to report everything that is said, and then printing it without editing it. The Committee on Publication has always supported the plan that instead of a great number of pages of stenographic notes of a meeting, the JOURNAL shall print an interpretative report only a page or two in length

Indexing The records of the activities of the medical societies of States and Counties are contained almost exclusively in the State Journals, and among them the NEW YORK STATE JOURNAL OF MEDICINE has set a new standard of recording

REPORT OF THE COUNCIL

To the House of Delegates—

Gentlemen

The Council has the honor of submitting the following report which includes those of the Executive Committee and the Committee on Publication.

Three meetings have been held, May 22, June 21, and December 13, 1928, the first being held in Albany

In accordance with a provision of the By-laws, the following members of the Council, nominated by the President, were elected to serve, with the officers therein specified as the Executive Committee W Warren Britt, John A Card, Paige E Thornhill, LaRue Colegrove and Austin G Morris

Appointments were made as follows

Committee on Budget John A. Card, Daniel S Dougherty, Charles G Heyd

Committee on Publication William H Ross, James Pedersen, and Daniel S Dougherty

Editor-in-Chief Orrin S Wightman, Executive Editor, Frank Overton.

Legal Counsel Lloyd P Stryker The appointment of an attorney was left to the Counsel, Mr Oliver having resigned

On motion, it was decided that the Society be placed on record as approving the work done by Mr Oliver and that a letter of thanks and appreciation be sent to him

The thanks of the Council were extended to the Committee on Arrangements

The meeting adjourned to meet in New York City on June 21st

The principal business of the adjourned meeting was the appointment of committees, the receiving of reports and the transaction of such business as has been referred by the House of Delegates

The following appointments of committees were presented by the President and confirmed

Committee on Legislation Harry Aranow, and Garrett W Timmers

Committee on Public Relations William H Ross, William D Johnson, Oliver W H Mitchell and Augustus J Hambrook

Committee on Public Health and Medical Education George W Kosmak, John O Polak, George F Chandler, Edwin MacD Stanton, William A Groat, Chalmer J Longstreet, Stanhope Bayne-Jones and Clayton W Greene

Committee on Medical Research Augustus B Wadsworth, Stanhope Bayne-Jones, Burton T Simpson, Simon Flexner, Alvin G Foord and Joshua E Sweet

Committee to Formulate a Plan to Make the Directory Official for three states William H Ross, Orrin S Wightman, and Harry R Trick

Committee to Study the Question of the Annual Meeting James N Vander Veer, John A Card and Daniel S Dougherty

Committee to Study the Nurse Problem N B VanEtten, Chairman, Andrew Sloan, J Richard Kevin, George W Kosmak, George R Critchlow, George E Beilby, Arthur S Chittenden and Walter H Conley

Committee on Toxin-Antitoxin Nathan B Van Etten, Chairman, Matthias Nicoll, Linsly R Williams, George F Raynor, Charles A Gordon, W Warren Britt, Frederic E Sondern, Herman G Weiskotten, and William H Ross

Committee on Transportation to the American Medical Association Meeting John A Card and Arthur W Booth

Committee on Medical Economics referred to the Executive Committee, as was the appointment of the Chairman of the Committee on Arrangements

The appointment by the President of Martin B Tinker, as the representative of the Society on a Tri-State Conference Committee to consider legislation relating to private hospitals in the Three States, was confirmed

Permission was granted to the Chairman of the Committee on Scientific Work to draw up rules and regulations governing the presentation of scientific papers before the various sections and refer them to the Executive Committee for approval

The meeting held December 13th in New York City was devoted mainly to routine business

A plan for the betterment of the scientific program was presented by the Chairman of the Committee on Scientific Work and approved

The resolution of the Executive Committee granting the insurance representative permission to send to the members reprints of an article on Medical Defense, published in the *State Journal*, was reconsidered and the reprinting of such articles forbidden

The present policy of the *New York State Journal of Medicine* regarding advertising was approved

Amendments to the By-laws of the Dutchess-Putnam County Society, the Albany County Society, the Kings County Society and the Erie County Society were approved

The Committee on Legislation was instructed to study the question of the inspection of private hospitals to the end that a bill be drawn up and introduced into the Legislature governing their inspection

Executive Committee

The Executive Committee has held eight meetings and will hold one more before the Annual Meeting

The work of this Committee has been mainly routine in character, providing for the proper and

efficient carrying on of the business of the Society, acting on reports of committees and regulating their work, appointing necessary special committees, considering expenditures and applications for appropriations and transmitting those endorsed to the Trustees for their approval

Mention may be made of the following actions The appointment of James N Vander Veer, John A Card and Orrin S Wightman as a Special Committee in charge of the general arrangements at the Annual Meeting, the appointment of the Standing Committee on Arrangements, Hyzer W. Jones, Chairman, George M Fisher, Andrew Sloan, Edward R Evans, Thomas H Farrell, T Wood Clark, Joseph L Golly, F M Miller, and William Hale, Jr , of the Committee on Prize Essays, Arthur J Bedell, Thomas H Curtin and John E Jennings, of the Committee on Medical Economics, C Ward Crampton, Morris G Rosenthal, H P Hourigan and Homer J Knickerbocker, and of a Special Committee on Group Insurance, John A Card, and Charles Gordon Heyd.

The place and date of the Annual Meeting were considered and Utica and the 3rd, 4th, 5th of June selected

The report of the Special Committee on Budget was received and recommended to the Board of Trustees for approval

An extremely important opinion was rendered as follows It is the opinion of the Executive Committee of the Council of the Medical Society of the State of New York that medical publicity is that which is educational and deals with the medical profession in its entirety—whereas medical advertising appertains to that medical publicity which deals with the individual and may be used to his or her personal advantage

The Committee on Publication

The *New York State Journal of Medicine* is the principal means by which physicians learn of the accomplishments, policies, and aspirations of the State Society and its component County Societies The JOURNAL is published under the auspices of a Committee on Publication appointed by the Executive Committee under the authority of the By-laws of the State Society

Organization The JOURNAL was managed as a part of the routine work of the Secretary's office until January 1, 1924, when a full-time Executive Editor was employed A separate office and an executive staff were established in November, 1927, when the Society moved into the new building of the New York Academy of Medicine at 2 East 103rd Street, New York The JOURNAL now has its own rooms and a full-time staff consisting of an executive editor, two expert clerical assistants, and an advertising manager, but the secretary's office still collects the advertising bills and makes out the mailing lists

The Editor-in-Chief takes an active part in getting out every issue of the JOURNAL. Every editorial and every report of meetings involving a statement of policy of the State Society is submitted to him for reading and approval, and also to the Committee on Publication The Committee on Publication believes that the JOURNAL closely represents its constituents

Departments The JOURNAL has undergone a progressive evolution during the five years since it was reorganized with a full-time staff, when the policy of departmenting the JOURNAL was begun Some departments have been dropped owing to lack of support, and others have been added as occasion demanded The JOURNAL is now divided into eleven distinct departments, each beginning with a box heading at the top of the page

Number of pages in each department of the New York State Journal of Medicine during the last five years

	1924	1925	1926	1927	1928

Advertising	442	472	532	645	636
Total Pages	1476	1604	1628	1928	1968

Interpretative Reporting Special attention is called to the News Department. The Committee on Publication has adhered to the policy that the items shall be on the activities of the medical societies of the State, the District Branches, and the Counties The value of these items is permanent, in contrast with the ephemeral value of the items which are merely personal or local

The Committee on Publication reiterates the distinction between "reporting" and "editing" The easiest form of reporting a conference is that of hiring a stenographer to report everything that is said, and then printing it without editing it. The Committee on Publication has always supported the plan that instead of a great number of pages of stenographic notes of a meeting, the JOURNAL shall print an interpretative report only a page or two in length

Indexing The records of the activities of the medical societies of States and Counties are contained almost exclusively in the State Journals, and among them the NEW YORK STATE JOURNAL OF MEDICINE has set a new standard of recording

these activities during the last two years The number of subjects covered in these reports is surprisingly large, as is shown by the fact that the index of the activities of medical societies recorded in the JOURNAL during 1928 was five pages in length Following the approval of the Council, the editors have prepared a similar index for the first quarter of 1929 covering two pages, and have published it in the April first issue The special object of the indexes is to enable the officers of the medical societies to find the records of any activities which they may be planning, and thus to make use of the experiences of those officers who have preceded them The indexes will be of value just now when lay associations are preempting the field in which the family physicians are naturally the leaders They also show the New York State Medical Society in an exceedingly favorable light in regard to the leadership of the medical profession of New York State in advanced medical society work

Reports of County Societies The Publication Committee has made many attempts to secure reports of all county society meetings, but only about one-half of the societies have responded

The JOURNAL has printed all reports which have been received, and in the future will devote all the space that is required to print all that may be sent There seems to be no common factor to account for the differences of the reporting of the counties

Scientific Department During the past year there has been an over-abundance of scientific articles offered to the JOURNAL, and the JOURNAL can now exercise a wide choice regarding the acceptance of articles Moreover, contributors have shown a willing cooperation with the editors in regard to the form of the articles, and not infrequently authors have re-written articles to conform to the practical needs of the general practitioners who compose the majority of the members of the State Society

The amount of scientific matter published in the JOURNAL could be increased readily, but the practical limit is the quantity which the average doctor can read, and also the quantity which the present editorial staff can prepare and the treasury of the society can pay for

The Advertising Department The advertising department of the *New York State Journal of Medicine* continues to carry the greater part of the cost of publishing the JOURNAL Very few Journals of any kind can exist without subscription lists A subscription charge of $1 75 per member would cover the annual net cost of the *New York State Journal of Medicine*

The following shows the JOURNAL receipts and expenses exclusive of stenographers' salaries, rent, incidentals, etc.

Receipts

Advertising and Sales	$38,499.96
Income from dues	11,594 00

Expenses

Salary of Editors	$ 6,700 00
Printing, postage, mailing	36,895 75
Commissions	8,166 48

While the expenses of publishing the JOURNAL have increased one and one-half times during the past five years, the receipts from advertising have increased two and one-half times

The number of pages of advertising are now only fifty per cent larger than they were five years ago, therefore the two and a half times increase in the receipts are due largely to a doubling of the rates Advertisers are now friendly toward the JOURNAL, and large advertising agencies are seeking admission to its pages

During the past year the Committee on Publication and the Editors have given much thought to the character of the advertising that has been accepted, and have adopted the policy of editing advertising copy as if it were a scientific article or news item It is surprising to find that advertisers and advertising agencies say that other Journals do not usually edit advertising copy, but that they either accept or reject copy without comment Many articles in common use by physicians are refused places in the advertising columns of medical journals because of extravagant claims for their healing virtues The members of the Committee on Publication have discussed the form of advertising copy with several advertising agencies, and have always found the advertisers willing to accept editorial suggestions Edited advertising copy from these firms is accepted, provided they will make the copy offered to other journals conform to the standard of the *New York State Journal of Medicine* It would seem that this attitude of the *New York State Journal of Medicine* will have a great effect in raising the standards of advertising in all the other medical journals

Directory

Receipts and Expenses, exclusive of stenographers' salaries and incidentals

Respectfully submitted,

DANIEL S DOUGHERTY,
Secretary

April 15, 1929

REPORT OF THE BOARD OF TRUSTEES

To the House of Delegates—

All of the meetings of the Board of Trustees have been faithfully attended during the year, each trustee showing studiously keen interest in the conservation and development of the financial strength of the State Society

The President, the Treasurer, the Secretary, and the Speaker have been constant co-laborers and have given highly appreciated counsel

Although the Trustees may not originate or suggest appropriations, they are interested in budgets which will apportion income fairly among the legitimate activities advocated by the House of Delegates or the Council, so that there may be as far as possible equable return upon his investment to each member of the Society, and also provide for future emergency or defensive demands.

Your Trustees are unanimous in the opinion that they would be culpably improvident if they failed to make the effort to develop reserves from savings, and they have succeeded in setting aside funds in investments as shown in the Treasurer's report.

The Trustees unanimously concur in the opinion that wisdom dictates the accumulation of a Trust or Investment fund of at least $150,000, one-half of which is already in hand It is suggested that these funds be allocated as follows

(a) A straight investment fund of $100,000

(b) A loss depreciation and replacement fund of $10,000, which would permit replacement of furniture and wear and tear of equipment out of an annual income of $500 00

(c) The creation of a Directory Trust Fund of $15,000 00 with an annual income of $750 00

(d) The creation of a Journal Investment Trust of $25,000 00 with an annual income of $1,250 00

The Trustees believe that respect for organized medicine will be in great measure proportionate to financial strength as represented by sound policy and substantial accumulation

Respectfully submitted,

NATHAN B VAN ETTEN, *Chairman*

April 15, 1929

REPORT OF THE COUNSEL

To the House of Delegates—

Gentlemen

Your counsel herewith submits his report for the activities of the legal department of the Medical Society of the State of New York during the twelve months from March 1, 1928, to and including February 28, 1929

This is the fourth annual report which your present counsel has submitted The past year, like its predecessors, has been a busy one both in court and consultation With his increasing knowledge of the medical profession, acquaintance with its members and appreciation of the problems both of the Society and of its individual members, your counsel is increasingly impressed with the weight of the responsibilities which devolve upon him by reason of his professional relationship with your Society There is the constant flow of litigation, consultation with the officers and individual members of the Society at meetings of the Executive Committee, the Council and other gatherings, and advice upon matters of legislation Your counsel is in a particularly fortunate position to study your profession There are few, if any laymen who are personally acquainted with more doctors or have had occasion more frequently to consider the problems of your profession, both the old problems and those which constantly arise by reason of the changing world in which we live Would that his discernment and ability were commensurate with his desire to help From his continuous contact with physicians, both individually and in groups, he has come to some understanding at least of the things for which they stand, of their aims and their objectives, and since he is a layman from the standpoint of the medical profession, he is able also to grasp something of the lay point of view toward doctors To the best of his ability, as occasion has arisen, he has endeavored to interpret the point of view of the one to the other

A better understanding of your profession by the public would eliminate many of the difficulties now confronting you and might tend to lessen the number of actions brought by patients against their physicians While the field of litigation has necessarily occupied a large part of your counsel's time and of his thought, he has become imbued with an increasing desire to assist in the solution of what may be termed the larger problems of your calling This desire, however imperfectly fulfilled, has animated a large number of his editorials and his addresses before various doctors' meetings The medical profession has a great opportunity for leadership both individually and collectively The great problems of the public health are problems for the solution of which the public naturally turns to you

In making his report, your counsel adheres to the convenient category employed by him in pre-

vious years, whereby his activities have been divided into three main divisions (a) the actual handling of malpractice actions before courts and juries and in the appellate tribunals, (b) counsel work with officers, committees and individual members of the Society, and (c) legislative advice and activities

Litigation

The field of litigation is ever before us No matter what is done malpractice actions will arise Not only the young and the obscure must face them, but sometimes the most honored and experienced practitioner finds himself confronted with a charge which must be defended before a court and jury There is much which a physician can do to prevent the likelihood of being sued, and in an effort to express these things in concrete form, the writer has endeavored to enunciate certain rules which every physician should have in mind whenever he is called to treat a patient These rules were set forth in a paper read by your counsel before the Geneva Academy of Medicine on January 10, 1929, the subject of his paper was entitled, "The Legal Aspects of the Practice of Medicine" It was printed in the *New York State Journal of Medicine* on February 15th of this year Some of you may be interested in turning to that article again, as it contains what the writer, at least, believes would help the individual practitioner in avoiding the unpleasant possibility of an action for malpractice Malpractice actions roughly may be divided into two categories (a) those with merit, and (b) those without merit While many unfounded suits are brought, let it never be forgotten that a large number of actions instituted represent meritorious claims, where the individual physician, although perhaps unwittingly and unintentionally, has departed from that standard of duty which the law imposes upon him Your counsel during the past year, as heretofore, has adhered to the policy that neither claims nor suits should be settled or compromised on a nuisance value basis Where, however, drawing on his judgment and experience, he feels that the proper practice has not been followed or in some other respects the doctor's legal duty has not been complied with, if a reasonable settlement can be effected, this has been done In no case is a settlement made without the acquiescence or approval of the physician who is sued Here, as in many other phases of this work, your counsel has been impressed with the value and importance of the Group Plan of Insurance to the individual practitioner Appended hereto as Table I, will be found a comparison of the number of suits instituted and disposed of in 1927-1928 and 1928-1929

It will be noticed that in the current year 168 new suits were instituted as opposed to 177 for the year previously reported on, or a decrease of 9 suits It will be further observed that during the current year 171 suits were disposed of as opposed to 126 during the previous year, or an increase of suits disposed of, of 45 Of the 171 suits disposed of, 100 resulted in a dismissal of the complaint, discontinuance of the action or a verdict for the defendant, 66 were settled and in only 5 (or less than 3 per cent) of the total of 171 were judgments rendered for the plaintiff In addition to the 171 suits disposed of, there were a large number of claims which never culminated in an action Some of these claims were disposed of by settlement and some through our successful efforts in dissuading the claimant from going further

Those of you who were defended by the writer or by his office during the past year, have no doubt a vivid recollection of the experience, but even these, we dare say, have only a slight acquaintance with the work which went into the case long before it was ever called in court We will not here detain you with a description of what this entails, as it was set forth by us quite fully on the first and second pages of the annual report which was last year submitted

We believe that that section of the bar of this state which interests itself in the bringing of mal practice actions, is coming more and more to understand, by reason of our conduct of your affairs, that no unmeritorious action will be settled and that no compromise will be effected merely because of the nuisance value of the claim

TABLE I

Comparison of the Number of Suits Instituted and disposed of in 1927-1928 and 1928-1929

		Instituted		Disposed of	
		1927-1928	1928-1929	1927-1928	1928-1929

	Pending on February 29, 1928	375			
	Pending on February 28, 1929		403		

When the facts demonstrate that a physician has been mistaken in his practice and he acquiesces in our judgment, we have uniformly adopted the practice (where a settlement within reason could be effected) of settling the case Such a disposition works justice both to the physician and to the patient

During the past year your counsel lost the services of Mr Robert Oliver, who was associated with this office and with the firm of Whiteside & Stryker for many years Mr Oliver's services were able, efficient, zealous and much appreciated both by the writer and we believe, by the medical profession also He received a flattering offer to enter the legal department of a firm representing large corporate interests and accepted that offer on June first of last year He left this office with the high regard and appreciation of the writer and he relinquished his duties as attorney for the Society under circumstances which resulted in a resolution of the Council expressing appreciation for his work and good wishes for his future

Upon Mr Oliver's retirement, Mr Lorenz J Brosnan was appointed attorney for the Society, and has been and is now acting in that capacity Many of you know him well Mr Brosnan entered the office of Whiteside & Stryker in the fall of 1920, has been continuously engaged in that office and in the writer's ever since He has developed unusual gifts as a trial lawyer and has proven his mettle against some of the ablest lawyers who locked horns with this office. His record of successful trials is a matter upon which your counsel desires here to congratulate him He has been entrusted with some of the most difficult cases in the office and has guided them through the courts to a successful conclusion With perfect confidence I can and do assign to him any case in the office with the knowledge that the doctor's cause will be championed with marked skill and ability He has a thorough knowledge of the law and unusual tact and discernment in court, as well as strong gifts of advocacy which he has developed under the continuous experience which has come to him

Mr Maxwell C Klatt, whose work your counsel has had occasion previously to commend, is a member of the bar whose early promise has been increasingly fulfilled Mr Klatt has likewise been in this office or in the predecessor office of Whiteside & Stryker for upwards of eight years Mr Klatt's knowledge of your problems and his experience with them has been developing rapidly He too is now engaged in court work and has justified the high confidence which your counsel feels in him In addition to these two lawyers, your counsel has two other members of the bar in his office, appreciation of whose services is here expressed These gentlemen are Harold Shapero and William F Martin Mr Shapero has been especially valuable in the preparation of cases, both upon the law, the facts and the medicine Mr Martin assists him in this work and has shown ability and great promise in the performance of his duties The other members of our staff are likewise deserving of commendation for their meritorious work

Your counsel does not intend here again to dilate upon the merits of the Group Plan It has been too well proven to require argument. It has been your counsel's experience with those of your members who have not availed themselves of the benefits of this Plan and who have subsequently been sued, that they have always voiced a deep regret and sometimes personal condemnation, and in such instances have usually applied for the benefits of the Plan to protect them, at least in any future cases To those who do not desire to avail themselves of the benefits of this Plan, it might be said that your counsel has yet to find a physician sued who has not expressed keen satisfaction that he is protected financially as well as legally

Table II, appended hereto, sets forth a comparison of the number of members insured in 1926, 1927, 1928 and 1929 What your counsel, the various committees of your Society and individuals have so repeatedly asserted is here again reaffirmed the Group Plan is working well and is deserving of your continued support From his long experience in your cases, your counsel is at a loss to understand how anyone would be willing to practice your extra-hazardous profession without the protection of insurance

During the past year it was found necessary slightly to raise the premium of insurance Table III hereinafter appended, sets forth the present rates The reasons for this slight increase were fully explained by Mr Wanvig, our insurance representative, to your Executive Committee, and its Special Committee on Insurance made a prolonged study of the figures, as a result of which the Executive Committee unanimously passed a resolution approving the increase This resolution, together with a report of your insurance department, were published in the NEW YORK STATE JOURNAL OF MEDICINE at page 2044 under date of October 15, 1928 While there has been a falling off in the percentage of insured in some counties, there has been a proportionate increase in others Altogether there is an increase of 276 members insured The slight decrease of one point in the percentage insured is due to a substantial increase in the membership

TABLE II

Comparison of the number of members insured in 1926, 1927, 1928 and 1929, and the number of members in the county societies and the percentage of insured members

COUNTIES	1926			1927			1928			1929

Counsel Work

During the period of this report, your counsel has prepared for publication in the Society's JOURNAL, articles in the nature of editorial comment These editorials have included the following

A Consideration of the Need of Legislation Bearing Upon the Question of Expert Testimony
Constitutional Law
Surgeons sentenced to the Electric Chair
Statute Law
Common Law
The Era of Good Feeling
Reprehensible Practices
The Police Power
The Writ of Habeas Corpus.
Bootleg Insurance.
Trial by Jury
The Subpoena—Pest or Privilege
The Practicing Physician in Court.
The Problem of Ascertaining what the Law is
The Doctor and the Law
The Bar Cleans House.
The Applied Art of Psychology and the Laws of the State of New York.
Is Law a Science?
The Origin, Authority and Function of the Health Department.
The Importance of Tact in the Practice of Medicine
The Subpoena as Applied to the Doctors or Nurses of a Charitable Hospital.
The Legal Aspects of the Practice of Medicine.

As in previous years, your counsel has digested, and there have been published in the JOURNAL, reports upon malpractice actions which it has been felt were of special interest to the profession The case reports published during the previous year are as follows

Pseudo-pregnancy—Ether Anaesthesia—Death
Caesarian Section—Infection—Death.
Improper Treatment of Syphilis.
Colles' Fracture with some Resultant Deformity
Claimed negligent Curettage.
Claimed Burn by Baking Treatment
Abrasion to Back during Mastoid Operation
Negligent Treatment of Fracture of the Ilium Resulting in Tuberculosis
Operation for Bunions—Superficial Infection
Acute Gastro-enteritis and Nephritis.
Removal of Tubercular Kidney
Scalp wound—Subsequent Cellulitis
Failure to Attend at Delivery
Acne Vulgaris—Claimed Improper Treatment by X-ray
Mastoiditis—Sinus Thrombosis
Claimed Negligence in Administering Injections
Fracture of Shoulder—Failure of cooperation by Patient.
Psoriasis of the Scalp—X-ray Treatment.
Claimed Negligence in the Reduction of a Fracture of the Leg
Failure of Patient to follow Instructions
Pediculosis pubis—Claimed Improper Instructions by Defendant.
Claimed Conspiracy to Commit to Insane Asylum
Claimed Negligence in Delivery
Claimed Negligence in Injection for Syphilis

These editorials and case reports have been prepared as a result of much labor, and it is a source of gratification to your counsel that on so many occasions he has received approbation for his efforts in this direction

In addition to his other duties, your counsel receives frequent requests for opinions upon various subjects These come not only from the county societies, officers and committees of such societies, but from the individual members as well Some of these inquiries related to matters of sufficient general interest to find reflection in editorial comment, others have resulted in private advice Some of the matters upon which advice has been thus rendered are as follows

Inquiry with reference to the confidential relationship existing between physician and patient.

Inquiry regarding the engagement of an unlicensed physician to practice medicine under the supervision of one who is licensed.

Communication and advice with respect to the extent to which visiting nurses to the poor may render treatment.

Inquiry regarding extent to which a dentist, who is not a physician, may practice oral surgery

Inquiry regarding when plaintiff must post bond as security before commencement of action for malpractice

Inquiry regarding extent to which one who is not a physician may practice the healing art.

Communication and advice regarding the extent to which physicians may go in adopting unproven scientific discoveries

Inquiry regarding extent to which X-ray technicians may practice radiology and when such practice violates the Medical Practice Act.

Inquiry regarding when publication of health column in newspaper is a violation of the Medical Practice Act

Inquiry regarding when non-residents of a local charitable hospital may be moved to the place of their residence

Inquiry as to extent to which non-medical persons may assist physicians without violating the Medical Practice Act.

Inquiry and advice regarding the ownership of X-ray plates

Communications regarding the extent to which charitable aid associations may proceed under their charter, and the extent to which such associations may supervise local health boards

Inquiry as to arrangement for charging fees for operations by clinics

Inquiry as to the rights, privileges and duties of a physician when subpoenaed to testify in behalf of a former patient in a civil action.

Inquiry as to extent to which a wife and widow is obligated to pay for medical services rendered to her husband during his last illness

Inquiry regarding the payment of compensation to municipal employees by a third party for the performance of official duties, and the extent to which a charitable corporation may partake therein

Inquiry regarding the statute of limitations in a malpractice action where the patient was an infant.

Inquiry regarding the extent to which an osteopath may treat and attend patients in hospitals, and the extent to which hospitals may designate and appoint particular physicians who may treat and attend patients in its hospital

In addition to the foregoing, your counsel attended a meeting of the Fourth District Branch on September 24th and spoke at a most delightful dinner at the Country Club He attended also a meeting of the Sixth District Branch on September 25th and there read a paper entitled, "The Doctor and the Law," which was later printed in the NEW YORK STATE JOURNAL OF MEDICINE on November 1st On December 21st your counsel appeared before the New York County Medical Society and there read a paper entitled, "The Importance of Tact in the Practice of Medicine," which was later printed in the NEW YORK STATE JOURNAL OF MEDICINE on January 15, 1929 Your counsel attended a meeting of the Medical Jurisprudence Society and there read a paper entitled, "The Applied Art of Psychology and the Laws of the State of New York," which was later printed in the NEW YORK STATE JOURNAL OF MEDICINE on December 1st Your counsel also read a paper before the Geneva Academy of Medicine on January 10, 1929, the subject being, "The Legal Aspects of the Practice of Medicine." Your counsel attended a dinner of the Hudson County Medical Society at the Hotel Pennsylvania held on the evening of January 26, 1929, and there spoke upon the subject of "The Doctor and the Public," which was later printed in the NEW YORK STATE JOURNAL OF MEDICINE on March 15, 1929 Your counsel also attended a meeting of the Tri-State Conference held on February 2, 1929 Your counsel has likewise been repeatedly consulted concerning the amendments to By-laws of the various county societies

Legislation

From time to time, as they have been introduced, bills pending before the legislature have been forwarded to us for our opinion, and we have expressed in writing our opinion thereon Among such other communications the following might be mentioned

Inquiry on a bill introduced by Senator Baumes which sought to add a new addition to the Mental Hygiene Law with a view to securing more competent medical opinion with respect to the mental condition of a person in a criminal proceeding

Inquiry on the bills introduced by Senator Sheridan, which were the direct result of the fruits of an investigation, commonly known as the ambulance chasing investigation, conducted by the metropolitan bar associations, before Mr Justice Wasservogel Part of Judge Wasservogel's report on this investigation had to do with the connection sometimes found between the ambulance chasing lawyer and the physician who betrayed his sacred calling for financial gain These bills were designed, among other things, to correct this abuse.

Inquiry on a bill introduced in the Assembly entitled "An act to amend the lien law in relation to a lien of a hospital for treatment in case of accident" Your counsel was requested to and did propose an amended law so as to make the lien not only that of the hospital, but as well as of the individual physician or nurse who rendered treatment

During the legislative session your counsel received a number of bills, upon which though his opinion was not specifically requested, nevertheless he felt it incumbent upon him to read and did read and analyze said bills in order to ascertain whether or not they were of sufficient importance to the medical profession to comment upon them, and preparation was made to advise your legislative committee should the bills in question have been pushed for passage

On February 22, your counsel, together with a Committee of your Society headed by your able President, Dr Harry F Trick, appeared before the Committee on Law and Legislation of the Board of Regents in opposition to a bill introduced on behalf of the osteopaths, whereby it was sought to give to the osteopaths the right to administer anaesthesias and to perform minor surgery As a result of this conference, we are pleased to report that the Committee on Law and Legislation of the Board of Regents went on record as opposed to this legislation and sustained

our objection thereto The bill was not passed

It is gratifying to note that there has been an increase during the past year in the members of your Society. In 1925 there were 10,410 members, in 1926, 10,677, in 1927, 10,829, in 1928, 11,259 and in 1929, 11,806

Your counsel takes this occasion again to thank your individual members, your officers and your committees for the cordial cooperation, assistance, advice and encouragement which they have uniformly rendered him During the past year many of your members have come forward to give expert testimony in court and have thereby not only championed the cause of an unjustly accused fellow practitioner, but have enlightened the court with scientific opinions of great value From his observation of and intimate contact with your affairs, it is your counsel's belief that the Society is to be congratulated upon the character of its officers and committees, and upon the ability and zeal which they uniformly display in the furtherance of your interests

Your counsel cannot close this report without here again expressing his own and the thanks of the profession for the services of your Authorized Indemnity Representative, Mr Harry F Wanvig He has given us insurance counsel of great value His ability, courteous and sympathetic assistance in all matters involving this important activity of your Society, have won him the complete confidence and respect of your Society He devotes his entire time to your work Whenever any difficult or complicated question has arisen, he has come forward freely and willingly to give his advice and his assistance On numerous occasions he has appeared before various meetings of your county societies and has read papers upon the subject of his specialty

Never before in the history of the Society has there been a better spirit of cooperation and a willingness to serve Never have there been stronger evidences of good will between the Society and its component county societies and its individual members The past is assured, you may look forward to a future of increasing usefulness and service

Respectfully submitted,

LLOYD PAUL STRYKER, *Counsel*

April 15, 1929

REPORT OF COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates

Gentlemen

The Committee on Medical Research desires to report that during the last session of the Legislature of the State of New York, Mr Vaughan introduced Assembly Bill No 166, to amend the penal law to prevent experiments of any kind on living dogs Medical and other educators and public spirited citizens were induced to protect its passage to their representatives in the Legislature

The Committee on Codes to which the bill was referred held a hearing on February 12, and our position in the matter was ably presented by Dr Simon Flexner of the Rockefeller Institute, Dr Horatio Williams of the College of Physicians and Surgeons and Dr J E Sweet of the Cornell Medical College The bill was not reported out of committee

Your Committee rendered like service in the matter of the bill introduced in the last Congress, H R 11998, "To prohibit experiments on living dogs in the District of Columbia or the territorial or insular possessions of the United States" The bill was referred to the Committee on Judiciary and not reported

In defense of animal experimentation it is necessary for those directly concerned to give constant consideration to the need of limiting this work to what is necessary and essential Also to the reasonable demand that dogs shall not be used if any other animal will serve the purpose

It is likewise important that all illegal experimental work by unqualified persons or in unqualified places shall be prohibited and that instances of such shall be reported to the proper authorities

Respectfully submitted,

FREDERIC E SONDERN,
Chairman

April 19, 1929

REPORT OF THE COMMITTEE ON LEGISLATION

To the House of Delegates—
Gentlemen

Your Committee on Legislation begs leave to offer the following report

Following the custom of preceding years immediately after the results of the election were announced, your Committee communicated with the newly elected legislators and those reelected, expressing the hope that they would endeavor, in their service at Albany, to maintain the high standards of medical practice established by former legislatures Your Committee offered, through the Executive Officer, to assist legislators in their consideration of bills that might be introduced having a bearing upon the practice of medicine We also presented our compliments to the new Governor and expressed the hope that if we could be of assistance to him in considering medical affairs in the state, he would give us the opportunity

Although this was a new legislature, there were but few changes in the personnel of the two houses A new chairman was appointed to the Public Health Committee in the Senate We are pleased to report that our work with him was very congenial, we found him deeply interested in the welfare of the public and the practicing physician and eager to avail himself of our offers of assistance

The usual bills—anti-vaccination and anti-vivisection, birth control, chiropractic, etc, were introduced, but none of them moved from the initial committees to which they had been referred Hearings were held on some of them, at which your committee was represented by the Executive Officer That we did not have more hearings can well be explained by the services rendered by our Executive Officer He has maintained an intimate relationship with the leaders in both houses and with the chairmen of the various committees, and was frequently called to advise them concerning the desirability of bills introduced

Of the 3417 bills before the legislature this year, 134 had some bearing upon the practice of medicine

We carefully read these bills in their original and amended forms—and some of them were amended three times

Owing to limited office force, we regret that we could not as in former years send the chairmen of the county committees copies of the bills except in certain special instances The one which we particularly favored was the creation of a medical council in the Department of Labor, which was introduced twice, but failed of passage because it, like many other bills carrying special appropriations, did not receive consideration in the jam of the last days of the legislature It had no expressed opposition and we believe that if it had not been for the confusion over the general appropriation bills, it would have been enacted The bill which requires that courts, when issuing a subpoena for hospital records must give the hospital at least twenty-four hours' notice, and the bill providing compensation to hospital employees working with radium or X-ray, we especially favored and did much toward securing their enactment We approved of the Poor Law as finally amended, several bills introduced by the Department of Health amending the County Health Law and the Sanitary Law relative to water supplies, and the commission authorized for a study of the mineral springs at Saratoga

A number of efforts were made to devise some legislation that would take care of aged poor None of these as drawn carried a medical clause, but, as we anticipated, none was found satisfactory and a commission has been appointed to make a study of this problem and submit suggested legislation in 1930 We shall keep in touch with this commission

The osteopaths desired to introduce their bill of former years, but before doing so, they appealed to the Board of Regents for support. The Committee on Higher Education of the Regents gave them a hearing and invited your committee, as representatives of the Medical Society, to sit in at the hearing held on February 22nd After the Regents had heard what was to be said by all present, they considered the matter among themselves and voted not to support the osteopaths if they attempted legislation along the lines requested It is probable that this action on the part of the Regents so discouraged the osteopaths that they made no effort to amend the law

It becomes our pleasant privilege to thank the officers of the State Society and the chairmen of the various county committees for their loyal and ardent support of our efforts

We regret that we cannot report the enactment into law of every bill in which we were interested, but it is a great satisfaction to us to feel that this year, through our Executive Officer, we did a greater share in constructive work than in former years

Respectfully submitted,
HENRY L K SHAW, *Chairman*

April 15, 1929

REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

To the House of Delegates—
Gentlemen

Your Committee on Public Relations has assumed its responsibilities and worked earnestly throughout the year to fulfill its mission From the onset it was keenly impressed with the importance of the task and the amount of work that will be required before it has harmonious and working cooperation between the three great agencies concerned in the development of better health conditions in our state I refer to the medical profession, State Department of Health, and the various voluntary health organizations, each of which, to a very considerable degree, at the present time, is working more or less alone, without that force which would ensue from a proper coordination of effort and a definite interlocking of activities, with the medical men in each locality assuming their normal position as leaders, advisors and active participants in all that has to do with the health, present and prospective, of our citizens

We are likewise conscious of the fact that lay organizations, working in the field of Public Health, have in many sections assumed the initiative and with their excellent organizations been able to dominate health activities which could have been directed much better by the members of the medical profession of each individual community or county

Your Public Relations Committee was organized during 1926 and until the present year its activities dealt largely with conferences with lay organizations and the State Department of Health relative to agreements and plans defining their respective fields of influence and work and how best to cooperate their health activities In theory this seemed to be a practical and essential plan of action and probably would have been successful had it not been for a violent outbreak in one of our counties between members of the medical profession and a lay organization which was conducting a Health Demonstration This condition indicated the strength of the lay organization and proved to the medical men that in the future they must take a greater interest in civic medicine, and furthermore must perfect their organization to such an extent that in each county medical society there must be a committee whose duty should consist of coordinating all of the forces working in the field of curative or preventive medicine within that county Therefore, your Committee on Public Relations at its organization meeting held in Albany July 7, 1928, determined that it would be necessary to perfect a definite organization and develop a Public Relations Committee in each county medical society Such Public Relations Committee to be composed of the leaders of the medical profession of the county and men who are known to have a large interest in civic medicine

Their duty should be to see that the agencies working for the betterment of the health within each county are coordinated, that the medical men assume their proper position as leaders, advisors and active participants in all civic and medical activities having to do with the betterment of the health of the people Hence the State was divided and approximately twelve counties allotted to each of the five members of your Public Relations Committee with the understanding that such member would personally see to it that his respective county medical societies were visited and urged to appoint Public Relations Committees composed of their strongest men, men of known ability as leaders Such County Public Relations Committees were to be instructed to make a survey of health activities at present operating in their counties together with all plans and possibilities for future development of an enlarged scope of such work These surveys are to be published in the *New York State Journal of Medicine* Such survey, to be of definite value, should deal with the following questions

1 Record of the number and distribution of doctors, hospitals and clinics

2 The County Medical Society—the activities it has undertaken and its plans for the immediate future, the interest being developed and encouraged in the field of Civic Medicine.

3 The County Tuberculosis and Public Health Association and its activities Its relations to the Medical Society The public health work it does, children's camps, nursing, publicity, etc

4 Other lay health organizations, such as Parent Teachers' Associations and Red Cross Attitude towards medical profession

5 Social Welfare Agencies, such as Child Welfare, clubs interested in any phase of health work —Rotary, Kiwanis, fraternal, etc

6 Health examinations of school children and children of pre-school age and the amount done in correction of defects The interest doctors show in the examination of the children.

7 Local health departments Attitude of local health officers and boards of health

8 The peculiar health needs of the county

This work of organizing and developing Public Relations Committees in each county medical society to a standard adequate to meet present and future health conditions, and obtain the necessary health surveys of each county, will, of necessity, be a process involving the expenditure of much time upon the part of each member of the committee, probably entailing several visits to each county medical society before we have such Public Relations Committees in the county medical societies working satisfactorily, and leading, as they

should, all matters appertaining to the health in their respective sections

We are anxious to make progress along substantial lines and see that the organized medical body assumes its full responsibility in developing improved health conditions throughout the State Already we point with pride to the fact that the medical men of the following counties have indicated the advancing health conditions in their respective districts by submitting to this committee the health surveys of their counties, all of which have been published in the JOURNAL and indicate progress along the lines of civic medicine These counties are Suffolk, Saratoga, Montgomery, Oneida, Dutchess-Putnam

The Committee is also impressed by the excellent work being done by the Suffolk County Medical Society in having established a county health department, the first to be organized in the State of New York, by the organized medical body of a county

In this advance Public Health development there has been a very beautiful cooperation between the county medical society and the State Department of Health Your Committee sincerely hopes that other county medical societies will fall in line and develop similar health departments

In the several counties which have reported and published their surveys and in many others, as yet unreported, evidence is shown of active cooperation and harmonious work between the medical body, the State Department of Health and the lay organizations and a very definite trend towards the assuming of leadership by the Public Relations Committee of these county medical societies

In order to hasten the formation and to activate the Public Relations Committee in each county medical society the Chairman and other members of your Committee met with each District Branch Medical Society of the State at its annual meeting and addressed them upon the importance of our state committee establishing these county units, and especially advised them with reference to the appointment of leading men as members of such committees

Your Committee has adopted the Eight Principles evolved by the Council Conference Committee of your Society, working in conjunction with representatives of the Cattaraugus County Medical Society, State Charities Aid Association and the Commissioner of the State Department of Health These Principles were adopted by the House of Delegates of the Medical Society of the State of New York at your last meeting for the purpose of guiding and directing the conjoint work between the medical profession and lay organizations in all counties dealing with health These Eight Principles are as follows

The Eight Principles

1 The essential part of public health work being preventive medicine, there should be no failure on the part of official and unofficial health and welfare organizations to recognize the importance of the local practising physician

2 All those associated in the conduct of public health activities must recognize fully that preventive medicine is the doctor's rightful field and that laymen must at all times look to the medical man for guidance and leadership therein

3 Public Health work within a county involves three participating factors, lay organizations, official governmental agencies, and the members of the county medical profession

4 The evolution of a county health program should be the evolution of medical forces within the county It is not only the duty but the prerogative of the local physicians to assume leadership in the organization

5 The function of lay organizations and employees of the county health organizations, acting under the leadership of the practising physicians of the county, includes assistance in educational work, in helping those who are unable to carry out the doctor's advice, and in providing means whereby the public health program may be carried out.

6 Lay organizations are needed in the county Their cooperation is to be welcomed by the physicians They are needed for the great educational work they can do, for their influence on public opinion, legislation and laws, and in many other ways But preventive medicine must be controlled and guided by the medical men of the county

7 As the function of the county health officer is not to exercise the function of the physicians of the county but to explain the facilities and stimulate the use of these facilities by the citizens, therefore, before any innovations are put into effect by a Demonstration or other agency, they should first be thoroughly studied and discussed by the medical society and the professional membership of the county board of health

8 All local publicity should be of fact and simply to inform the people of the county of public health work which is being done, why it is being done, and why it should be done.

Likewise has your Committee adopted the program devised by the Committee on Public Relations of last year which consists of five definite functions of activity for the county medical societies' Public Relations Committees These Five Functions are as follows

The Five Functions

1 Make a complete survey of health agencies in the county, noting the names, membership, program and manner of carrying on their work

2 Collect data concerning all types of medical activities, both curative and preventive, and whether promoted by official or unofficial agencies

3 Confer with director or proper committee of every agency or organization interested in conducting or promoting curative and preventive

medical activities in the county, with regard to its program, for the purpose of offering assistance in the development of the medical phase of such program

4 Confer frequently with the public health committee of the County Society regarding the methods employed in public health work throughout the county

5 Be prepared to take leadership in developing programs of county agencies

These Eight Principles and Five Functions have been published in three different issues of the *State Journal* and received wide distribution by being sent as a pamphlet to various officers and committeemen of the county medical societies

Through the courtesy of our Publication Committee and the Editors of our JOURNALS we have been favored with an exceptionally large amount of publicity consisting of editorials and reports dealing with the subject of public health and public relations We are especially indebted to Drs Ross and Overton for their work along this very necessary line of publicity It is hoped that our membership is carefully reading these articles in our *State Journal* which appertain to the work of this committee.

We are pleased to note that through the initiative and effort of the Ontario Medical Society there has been established under a full time medical director, a School Health District for the County A similar plan has been established and such a school health district developed by combining a number of the townships of the western part of Montgomery County

We are gratified to note that the physicians of Oneida County, through their Public Relations Committee, are co-operating with and directing two State Governmental Agencies—Department of Health—Department of Education—in making a survey of the physically handicapped children in that county Such a survey of the handicapped children of a county has been likewise most successfully accomplished in Saratoga County, the work having been done entirely through the efforts of the County Medical Society

Upon invitation your Committee held a conference with the Committee on the Care of Crippled Children with reference to the medical aspects in the administration of the new law for the relief of crippled children This law authorizes the State to provide the means for caring for and correcting defects in children who are physically handicapped and provides for the payment of physicians for those cases where such payment would be a burden upon the family The cost of such care to these unfortunates is to be equally divided between the county and the state The two state departments entrusted with the administration of this law, the State Department of Health and the Department of Education, are desirous that the services rendered by physicians shall be properly compensated Naturally fees for professional work upon indigent cases would come under a social class where the compensation should be moderate and not such as would appertain in those of better financial circumstances Yet, the Committee on Care of Crippled Children does not desire to have this work done gratuitously, as has been very largely the case in past years They do wish the Medical Society of the State of New York through its House of Delegates to adopt a fee schedule which shall be a guide to the Judges in the various counties in passing upon allowances to Orthopaedic Surgeons in compensation for surgical care The application of such a schedule is to be state wide Your Committee on Public Relations recognized that the conference with the Committee on Care of Crippled Children could only be deliberative in character and any conclusions of said conference would have to be ratified by the House of Delegates of the Medical Society of the State of New York Hence they adopted the following principles and submitted them to the Committee

"The Public Relations Committee of the Medical Society of the State of New York thanks your Committee on the Care of Crippled Children for the privilege of advising with it concerning the questions now under consideration, and draws attention to the following principles governing the practice of medicine as enunciated by the Medical Society of the State of New York

"First That it recognize the principle that the State should adequately recompense physicians for the professional care of the *indigent* poor of the state

"Second That it is the duty of the State to determine who are permitted to avail themselves of this State aid, and not place upon the individual physician the economic burden of attending those who are financially able to pay, but who seek State Aid to the relief of their financial responsibility

"Third That it is recognized that economic principles enter into the practice of medicine on the part of the individual physician, and that whatever may be advised in expenditure of money on the part of the State in the questions under consideration, can only so be done on a minimum basis

"Fourth It is a recognized principle that no two cases of sickness or injury are exactly alike Therefore, whatsoever may be advised can only be for the immediate remedying of a condition Future attendance must be based upon the time and effort expended by the physician, and the responsibility of the physician does not cease until the case is discharged by him

"Fifth That through its proper committees, the Medical Society of the State of New York will be glad to advise with various committees of the State government in public welfare work designated for the care of the physically handicapped child, as to those who are considered competent to do such work who may be solicited in the helping out of the State in its program of betterment."

After a considerable discussion the following

fee schedule was suggested by your Committee for medical services rendered by physicians under the Administration of the Law for the Relief of Crippled Children

T B or Osteomyelitis of foot—	
Incision and drainage	$35 00
Tenotomy of Tendo Achilles—	
Closed operation	25 00
Open operation	30 00
Plantar Fasciotomy—including cast	35 00
Arthrodesis of foot—"reshaping the foot"	35 00
Club-foot, congenital and plaster cast	35 00
Open operation	70 00
Astragalectomy	50 00
Tentomy and tendon transplantation	75 00
Bowlegs (Osteoclasis)—single	35 00
Knock Knee (Osteotomy)	50 00
Knock Knee (Osteoclasis)—single	35 00
Bowlegs (Osteotomy)	50 00
Osteomyelitis Tibia and Fibula—drainage and curettage	75 00
T B of knee joint with plaster or brace	75 00
T B of knee with resection of knee joint	150 00
Tendon transplantation anywhere	75 00
Osteomyelitis of femur	75 00
Tenotomy of hamstrings	35 00
Ununited fracture of femur	150 00
Ununited fracture of tibia	100 00
T B hip without operation—cast or brace	75 00
T B hip with operation	100 00
Congenital dislocation of hip	75 00
Each subsequent manipulation and cast	50 00
Sutter fasciotomy	125 00
Arthroplasty or Arthrodesis of hip	100 00
Subtrochanteric Osteotomy	75 00
Tenotomy of adductors	50 00
Other plastic operation at hip	100 00 to 125 00
Major operation of spine	150 00
T B spine without operation—	
For each cast or brace fitting	35 00
Aspiration of spinal abscess	35 00
Scoliosis—per cast	25 00
Shoulder resection or arthrodesis	100 00
Shoulder muscle transplantation	100 00
Elbow resection or arthrodesis	75 00
Elbow arthoplasty	100.00
Osteotomy of humerus	50 00
Resection of wrist or arthrodesis	50 00
Plastic operation of wrist or tendon	50 00
Tenotomy of tendon of wrist	35 00
Osteomyelitis of upper extremities	75 00
Torticollis operation—open operation	75 00
T B shoulder without operation—per cast	35 00
T B elbow without operation—per cast	25 00
Arthrodesis of knee	100 00
T B wrist without operation—per cast	25 00
Anesthetic fee minimum—simple ether	10 00
X-Ray taken—single	10 00

This fee schedule met with the approval of the Committee on Care of Crippled Children and it now remains for the House of Delegates to pass upon it and concur or reject the proposed schedule *We recommend its acceptance*

Your Committee feels encouraged and activated by the many inquiries from medical men throughout the state asking for information relative to methods in working out the problems for cooperating with other existing health agencies in their district

This Committee feels that its immediate future work consists in establishing contacts with the Public Relations Committees of the county societies and helping them with their problems At the same time many contacts and conferences with state-wide governmental and voluntary organizations will be necessary before proper coordination is obtained and the medical profession has assumed its full responsibility in the field of public health and preventive medicine

JAMES E SADLIER, *Chairman*

April 15, 1929

REPORT OF THE COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

To the House of Delegates—

Gentlemen

Your Committee on Public Health and Medical Education begs leave to submit the following report for the current year

A review of the reports of this Committee to the meetings of the House of Delegates in the years 1926, 1927 and 1928, together with consideration of this year's work indicate that regardless of changes in personnel of the Committee it has progressed along very definite lines While fully aware of the multiplicity of problems with the consideration of which it is charged, the Committee has, nevertheless, proceeded cautiously and slowly using its efforts and resources only where these will be most effectively applied without radical changes or spectacular innovations It is, of course, well recognized at the present time that the broadening field of Public Health activities must include different groups of people as for instance the public, the official agencies, the volunteer group and the medical profession On the other hand in the progress of Public Health work there is nothing to indicate but that the physician, who, as a result of training, experience and the special opportunities which he enjoys, is the one not only to head and direct Public Health work but also the one upon whom, alone, rests the responsibility of solving certain definite problems in modern Public Health Your Committee has continued its policy that adequate medical care is the greatest single contribution which the medical profession can make to the cause of Public Health, and believing that continuous graduate medical education is one means toward accomplishing this end, has had for its major activity this year, as in the past few years, post graduate medical courses before county medical societies

Graduate Education

The work in graduate education carried on by

the Medical Society of the State of New York for the year beginning July 1, 1928, includes courses given in the following counties (The name after each county indicates the subject of the particular course, while the number refers to the number of lectures included in the course)

Fall of 1928

Delaware	Tuberculosis	6
Ontario (with Wayne, Yates and Seneca)	Internal Medicine	6
Steuben	Internal Medicine	6
Monroe (2 courses) (with Livingston)	Internal Medicine	5
	Surgery	5
Genesee (2 courses) (with Orleans & Wyoming)	Internal Medicine	5
	Surgery	5
Sullivan	Heart Disease	4
Cayuga	Gastro-Enterology	6
*Cortland	Internal Medicine	3

Spring of 1929

Tompkins	Internal Medicine	6
Albany	Gastro-Enterology	6
Montgomery	Gastro-Enterology	6
Clinton (with Essex & Franklin)	Diseases of the Blood	4
Chemung (with Tioga & Schuyler)	Heart Diseases	6
St. Lawrence	Internal Medicine	6
Jefferson	Internal Medicine	6
Herkimer	Internal Medicine	6
Washington (with Warren)	Physiotherapy	4
Onondaga	Heart Disease	4
Oswego	Heart Disease	4
Chenango	Obstetrics	6

(At the time of writing this report the Committee is in communication with Otsego and Schoharie Counties regarding courses which may be given during the month of June.)

(These lectures will cover 31 counties, slightly over half of the state. One entire district branch (the Seventh) has been covered in this year's work.)

While a detailed record is being kept of data concerned with these courses, it is obvious that a report at this time can only cover the courses given before January first, a summary of which follows

Total number of courses	9½
Number of county medical societies before which courses were given	14
Total attendance of all courses	2630
The largest attendance for one course (Monroe county)	836
Smallest attendance for one course (Sullivan county)	126
Total cost of all courses	$2,266 55
Average cost per course	238 58
Average cost per county	167.89
Average cost per attendance	86

It will be observed in several instances of the work during this year that one or more counties have joined with another county in one course of lectures It will also be observed that counties in close proximity have selected the same course of lectures which have been given simultaneously

*Three lectures in this course were given late in the spring of 1928.

As a result of these conditions it is believed that the work has not only been performed more economically but decidedly more efficiently These arrangements have made the arduous work of the lecturers more convenient and have also added to the convenience of the members of the county societies, in as much as it frequently happens that a member of one county society is located nearer to the seat of lectures in the neighboring county society He is thus able to have the same course of lectures as his fellow members with less trouble and inconvenience to himself These plans have also made it possible to secure for small counties, groups of lecturers whom it would be otherwise impossible to obtain The combination of counties has also aided in perfecting the local arrangements for the lectures which is a very important consideration in this work A tendency for near-by counties to continue this plan is growing and with it is an apparent tendency for the county societies to leave the matter of graduate education and the arrangement of the local details in the hands of committees, the personnel of which remains fairly permanent This tendency on the part of county medical societies is to be greatly encouraged and particularly aids the State Committee with its well organized plans for future work

In as much as the annual reports of standing committees have to be prepared several weeks before the meeting of the House of Delegates and as the work of the Committee covers the period for 12 months beginning July 1st, it is impossible to summarize the current year's work at this time Therefore, it is thought that a review of the work for the year 1927-28 should herewith be presented This is summarized as follows

Total number of courses	21½*
Number of county medical societies before which courses were given	22
Total attendance of all courses	3,268
Largest attendance for one course—Albany	495†
Smallest attendance for one course—Greene	42†
Total cost of all courses	$4,524.82‡
Average cost per course	215 47
Average cost per attendance	1.38

We are now at the completion of two years during which period the work of graduate education before county medical societies, under the auspices of the State Society, has been taken over entirely by this organization During this time there will have been given 42 courses covering 38 counties, fifteen of which have had two courses It is interesting to know that of these 42 courses, 16 were courses in Internal Medicine, outlined by Doctor W W Palmer, Professor Medicine, Col-

*The one half course refers to Cortland County where lectures of the course were given during the year 1927 28, the remaining lectures during the year 1928-29

†It must be taken into consideration that the membership of these two societies vary greatly The percentage of members attending the lecture in Albany County was 37 per cent, while the percentage of members attending the lecture in Greene County was 45 per cent.

‡This figure includes only the actual travelling expenses and honorarium fees of the lecturers.

lege of Physicians and Surgeons of Columbia University, New York City, and 11 were courses in Heart Disease, outlined by Doctor John Wyckoff, Professor Medicine, Medical College of New York University The 16 courses in Internal Medicine actually reached 22 counties and the 11 courses in Heart Disease actually reached 13 counties It is our belief that these figures show in a very positive way the demand on the part of the physician for instruction in those subjects which he most commonly meets and it is our opinion that these figures are a compliment to the good judgment of the county medical societies in picking out such practical subjects

As in the past the Committee has carried on its courses as a distinct activity separate from county medical society meetings with which it feels there should be no interference The Committee has also planned its work so as not to interfere with the meeting of the State Medical Society or that of its District Branches The sessions at which the lectures have been given have frequently been held at different times and places than that of the usual county meetings The procedure of giving the lecture has also varied from that of the reading of the usual medical paper The lectures are supposed to be distinctly instructional, of course bearing in mind that the audience is a matured one with considerable experience in clinical work In place of the usual discussion which follows a medical paper the lectures in these courses have been followed by a period of questions, answered by the lecturer which has proven most helpful

The Committee has attempted to present its work in well grouped courses which now comprise the following subjects

Dermatology and Syphilology	1 course
Internal Medicine	12 courses
Neurology	2 courses
Obstetrics and Gynecology	2 courses
Orthopaedics and Orthopaedic Surgery	3 courses
Pediatrics	2 courses
Periodic Health Examination	1 course
Physiotherapy	2 courses
Surgery	8 courses

With one or two exceptions the outlines have all been prepared by the medical teachers of this state who have also nominated the lecturers for the different subjects and who have correlated their work It is the opinion of the Committee that the State Society is under deep obligation to these gentlemen who have outlined the various courses Their aid was indispensable to making a beginning in the Committee's enlarged program of graduate education While the Committee has not tried to dictate to county societies in the matter of selecting subjects for lecture courses, it has encouraged them to adhere to the outlines as offered in order that future work may not be too complicated The outlines of the courses offered by the Committee has been put together in typewritten form in small pamphlets which are available for the use of county societies where a course is contemplated This plan has reduced the necessity of personal conferences on the part of the Chairman of the Committee with county medical societies during the past year, although such conferences from time to time are necessary, particularly when groups of counties join in the same course

The Committee has reorganized its method of reporting on its lectures and as stated before has adopted a system of tabulating the results of all courses This will allow the Committee to observe the progress or lack of progress of the work in the various counties as also the relative importance of the various courses The Committee has received requests from the States of Virginia and Michigan for information regarding its work in graduate education

During the two years that the State Society has sponsored the entire work in graduate education 241 lectures have been given by 79 lecturers coming from 14 different cities Many of these lecturers have given at least 5 or 6 lectures each year and many have traveled to all portions of the state and appeared before small as well as large county medical societies All of the lecturers have been men of approved standing as teachers as well as clinicians of wide experience. The willingness of the lecturer to accept assignments at a personal sacrifice and frequently involving a trip of considerable inconvenience deserves unusual commendation The Committee has expressed its gratitude to the various lecturers but it is our belief that the State Society should also express their thanks for the splendid work which these men have done

Public Health Activities

The special Public Health activities with which the Committee has been concerned are as follows

Diphtheria Immunization
County Health Departments
Tuberculosis
Periodic Health Examinations
Maternity Hygiene

The Committee has continued to watch with interest the campaign of diphtheria immunization of the Schenectady County Medical Society It would seem that the Schenectady Plan was based on a rational foundation, providing as it does for the constant employment of immunization, rather than for periodic intensive campaigns, and it is the feeling of our Committee that the Schenectady County Medical Society should receive greater support in this work from other organizations than it has heretofore The Committee feels that the Diphtheria Immunization of the children of this state can be more readily accomplished if the county medical societies are requested to participate in the work to a larger extent than they have in the past and that the simple acquirement of consent and approval from the county medical

society for Diphtheria Immunization is not sufficient participation of organized medicine in this work.

The Committee is glad to report that they were called upon by one county medical society for advice regarding the establishment of a county health department in that particular county The aid of the Chairman of the Public Relations Committee was also obtained through this Committee in the project

While the Committee's work in Graduate Education has a general Public Health aspect, the Committee has established courses which are definitely concerned with this work, notably with the subjects of Tuberculosis and Periodic Health Examinations It must also be remembered that the course on Diseases of the Heart has a direct bearing to Public Health work, as do also such lectures as Diabetes Mellitus and Scarlet Fever which have comprised subjects in the course on Internal Medicine One course of lectures on Tuberculosis was given before the Delaware County Society and at this course in a distinctly rural county there was an attendance at the lectures of 95 per cent of the county membership This interesting course was successful in every way and it is our feeling that this course should be repeated in many other counties and it is also felt that the expenses of such courses should come from the Christmas Seal Sale, as it would seem that this charge is a legitimate one against that fund

A course of four lectures on Periodic Health Examinations has been outlined by Doctor Otto H Leber of New York City So far the entire course of lectures has not been given in any county but it is very probable that some of the lectures will be given in at least 2 counties during the present year The Committee is hopeful that at the time of these lectures a public campaign will be carried on in the same county to educate the general public regarding the value and necessity of this procedure

On the question of maternal mortality the subcommittee appointed for study of this question is holding work in abeyance pending the investigation of other organizations who had previously undertaken similar work. This sub-committee has had one meeting this year called at the request of the Commissioner of Health of the State of New York for advice on certain problems dealing with maternal mortality

Other Activities

The Committee's attention was called early in the fall of 1928 to the fact that one commercial concern selling apparatus for physiotherapy was conducting courses in Physiotherapy in various cities throughout the State Immediately a letter was sent from the Chairman of this Committee through the Executive Officers of the State Society calling to the attention of all county societies that this Committee is prepared to offer without any charge a course of lectures on Physiotherapy to any county medical society, the courses to be given by men experienced as teachers in this subject

Furthermore, the county medical societies were asked to warn their members against obligating themselves by accepting a rebate on the tuition fee for the course of lectures from any commercial concern Despite this fact the same company continues to give such courses of lectures In connection with this we should like to call your attention to the fact that physiotherapy is a matter of extreme importance at the present time to the medical profession It is questionable whether or not lay persons are qualified to use these methods and whether in doing so great harm may result It would, therefore, seem wise if the House of Delegates would instruct this Committee or some other committee to take this question under official consideration

As in the past the Committee has been glad to be of service to county medical societies in aiding them in the preparation of their programs The Committee can be of further service in a similar way, if all county medical societies would send to the Chairman's office programs of their various meetings

The Chairman of the Committee has attended meetings of two District Branches as well as meetings of the Committee on Scientific Program and the Committee on Public Relations He has also attended and addressed regular meetings of three county medical societies At these meetings arrangements were perfected for courses in the various counties Both the President of the State Society and the Chairman of this Committee have personally attended many of the lecture courses The Committee has had one meeting during the year, at which the subjects reviewed in this report were considered

The Committee has made a start on supplying outlines of each lecture to be given to the members attending the lecture and which might serve as permanent notes It has also re-arranged its method of keeping records so that this particular activity of the State Society may be continued on a permanent basis In the courses given before county medical societies the Committee has made an attempt to reach members of the profession qualified for membership in the county medical society but not belonging to the same. The Committee has under consideration the extension of its work in graduate education laying greater emphasis on clinical teaching The Committee has been able to offer to county medical societies the free use of two obstetrical teaching films prepared by Dr Paige Thornhill, and has under consideration the purchase of a film on Infections of the Hand, which might be loaned to county medical societies, medical colleges and other medical societies Such a film if purchased might also be

used at the time of the meeting of the State Society

Finances

The Board of Trustees made an appropriation at the beginning of the year of $8,000 00 for this Committee The Committee is glad to report that they expect to complete the year with close to $1,000 00 to its credit This balance may be reduced slightly provided the teaching film on surgery, previously referred to, is purchased From the experience of the last two years it would seem now fairly apparent that the State Medical Society can carry on a comprehensive plan in Graduate Medical Education for a sum estimated between $7,000 and $8,000 per year

The Chairman of the Committee wishes to express his appreciation of the work of the other members of the Committee as well as the cordial assistance of the President, the Secretary, and the other officers of the State Medical Society Acknowledgment is also made of the excellent cooperation extended by the other standing committees of the State Society and of the most cordial relations between the Chairmen of the Committees on Scientific Work, Legislation, Medical Economics, and Public Relations, with the Chairman of this Committee A competent secretarial and stenographic service has relieved the Chairman of many of the details of the office work of the Committee

In summing up the work of this Committee we would say that the Medical Society of the State of New York is taking an active interest in Public Health work and is contributing to the cause of Public Health an activity of which private agencies as well as even official agencies have very little knowledge

Respectfully submitted,

THOMAS P FARMER, *Chairman*

April 15, 1929

REPORT OF COMMITTEE ON MEDICAL ECONOMICS

To the House of Delegates—

Gentlemen

The activities of your Committee on Medical Economics the past year have been devoted largely to the problems arising under the Workmen's Compensation Law

The bill sponsored by this Society, creating a Medical Advisory Committee, was defeated again this year However, our cause is not lost We are pleased to report that the sympathetic and understanding attitude of our present Industrial Commissioner Frances Perkins is making the solution of our medical problems an assured fact

The members of your Committee and other representatives of the medical profession have been invited before the Advisory Council to state the grievances of the medical profession and assist in the formation of plans for their eradication

Therefore, your Committee wishes to offer the following resolution

To Extend to Commissioner Frances Perkins Our Thanks

RESOLVED, That the House of Delegates of the Medical Society of the State of New York extend to Commissioner Frances Perkins our thanks and appreciation for the efficient and careful consideration of the medical problems before the Advisory Council, and that we hereby offer to her all facilities at our disposal to further aid in the solution of such problems

Your committee also wishes to offer the following resolutions

To Establish a Workmen's Compensation Reference Bureau

In our study of the problems of the Workmen's Compensation Laws, the idea of the establishment of a Workmen's Compensation Reference Bureau by the Medical Society of the State of New York seems of paramount importance. The reasons for the establishment of such a Bureau would be—

1st—To establish a clearing house for all Workmen's Compensation problems for all members of the State Medical Society

2nd—To correlate and systematize reports on compensation cases

3rd—To remove the cause for so-called padded medical bills

4th—To assist the Medical Education Committee in the establishment of post-graduate courses in physiotherapy and compensation technique

5th—To collect reliable data for the use of our Medical Advisory Committee and the Legislative Committee

Therefore your Committee recommends that this House of Delegates instruct the Council of the Medical Society of the State of New York to establish a Workmen's Compensation Reference Bureau, this Bureau to maintain a trained executive on full time salary

To Determine the Status of the Life Extension Institute and Define the Term "Practicing Medicine" by Judicial Decision

Your Committee has been informed by various members throughout the State, particularly in New York City, that the Life Extension Institute is practicing medicine

Your Committee finds that there is a great deal of uncertainty as to the definition of the term "Practicing Medicine"

Your Committee further feels that the Life Extension Institute was primarily organized to

advertise and give publicity to the value of periodic health examinations

Your Committee finds that the Life Extension Institute is examining people as individuals, for insurance companies and for business concerns, which procedure, on the part of the Life Extension Institute, is in direct competition with the private Doctors

Therefore, your Committee suggests that its Counsel, Mr Lloyd Stryker, be requested to confer with the Attorney General of the State of New York in the matter of beginning quo warranto proceedings against the Life Extension Institute to determine whether the Life Extension Institute is "Practicing Medicine" and to establish by judicial decision the definition of the term "Practicing Medicine" so that such decision may be used to determine what further action shall be taken against groups, lay organizations and business concerns employing Doctors, for the purpose of practicing medicine

To Establish Minimum Salary for Employed Physicians

Your Committee feels that there is a great disparity in the salaries paid to Doctors by Public Health, Welfare, Charity Organizations and similar Societies

This salary figured per hour varies from $1 per hour, paid in some of the New York Dispensaries to $2 per hour, paid by the New York City Board of Health for its part or full time men, to $4 per hour, paid by Charity Organization Societies

Therefore, your Committee suggests that a schedule of fees be fixed for Doctors employed by Boards of Health, Welfare Charity Organizations and other organizations The Committee feels that through the establishment of such a standard of fees, the individual Doctor will not be exploited by organizations utilizing his services

The Committee therefore recommends that all organizations employing Doctors shall pay a minimum of $5 per hour to such Doctors

Furthermore, the Economic Committee recommends that measures be instituted to have this standard accepted by Boards of Health, Welfare, Charity Organizations and other Organizations

Respectfully submitted,
W WARREN BRITT, *Chairman*

April 15, 1929

REPORT OF COMMITTEE ON SCIENTIFIC WORK

To the House of Delegates—
Gentlemen

The Committee on Scientific Work, through its Chairman, takes pleasure in submitting the following report

The Scientific Sessions have been rearranged

The Scientific Assembly will open on Tuesday afternoon when all of the members of the Society will collect in one room to listen to the presentation of some general medical problems On Wednesday afternoon leaders of American medicine will open the discussions on three subjects These two general meetings promise to be of unusual interest and your Committee feels that much good will be accomplished if all of us gather together for these periods devoted to a broader understanding of medicine and surgery

On Wednesday morning and again on Thursday morning the sections will convene in their respective rooms and listen to technical papers of interest to them in their more restricted fields

Your Committee urges your attendance at the general meetings and your whole-hearted support of the sections

The Chairman takes pleasure in expressing his appreciation for the hearty cooperation which has been given him by the President and Secretary of the State Society, the Section Officers and all others who have helped to make our Scientific Sessions successful forums for the dissemination of medical knowledge

Respectfully submitted,
ARTHUR J BEDELL, *Chairman*

April 15, 1929.

REPORT OF THE SECOND DISTRICT BRANCH

To the House of Delegates

Gentlemen

The annual report of the work of the Second District Branch for 1928, must be mainly one of progress in projects already begun or planned in previous years While continuing and completing old work may not be as interesting or spectacular as initiating new undertakings, it is essential if any real progress is to be made This seems to have been the thought guiding the activities of the four component societies of the Second District Branch during the past year

The annual meeting was held in Brooklyn on December 6th, 1928 The principle speaker was Dr Louis I Harris who addressed the members on the subject of the relations of organized medicine to public health and welfare work As in the two preceding years, a feature of the meeting was the reports of the work of the component county societies

Kings County's report showed "progress in the same general lines of community activity and professional work" as last year Interest in graduate education continues The Friday afternoon lectures have been continued and a large number of practical extension courses have been given in co-operation with the Long Island College Hospital and other hospitals The attendance at all the lectures and courses has been most gratifying The society has acquired a new site and is planning the erection of a new building that will be adequate for its increasing professional and civic activities and to house its already large and rapidly growing library

The Queens County Society has already broken ground for its new home and expects to occupy it within the year Its close co-operation with the county Tuberculosis and Public Health Association continues and is increasingly productive in results This is especially noticeable in the T-A campaign and in the treatment of children of school and pre-school age showing physical defects Queens County is also conducting lectures and courses in graduate education similar to those inaugurated so successfully in Kings County

In Nassau County probably the outstanding accomplishment of the year is the employment of an executive secretary, who devotes all his time to the conduct of the business of the organization The activities of the society have in consequence been given a tremendous impetus that is producing increasingly good results The project of a building and home all their own is being actively canvassed Graduate education is being continued in the form of lectures and clinical courses already proven successful in the past. Various forms of public health work, such as the T A campaign and the examination of pre-school children are being actively promoted Using its central office as a clearing house the experiment is being made of attempting to collect overdue accounts of the members

The Suffolk County Society made the establishment of a County Department of Health a major aim for 1928 Its efforts were so successful that the Board of Supervisors adopted the recommendation of the society and established the department and appropriated the money for its support The department has been so far organized that the county health officer, Dr Arthur T Davis, took up his duties January 2nd, 1929, and most of the other personnel has been selected This is the first county department of health to be established in New York State by local initiative and supported entirely by taxation without the aid of subsidies from outside the county welfare organizations Its accomplishments are therefore being watched with interest by health workers throughout the state and in other states

Each of the four component county societies issues a periodical bulletin primarily to keep the membership constantly informed of the progress of society activities In addition to this, the counties of Nassau and Suffolk aim to coordinate through their bulletins the work of the lay organizations doing welfare or public health work within their boundaries

In all of the societies co-operation with the lay and official welfare organizations, with medical leadership in their management, continues as a guiding principle of their work The Second District Branch still believes, in the words of last year's report, that "the development of public health and the practice of the prevention of disease is a doctor's game Only doctors have the ability through training to decide as between theoretical and practical activities in civic health matters The function of lay health and welfare organizations is to carry out the details of the treatment after the medical expert has made the diagnosis and prescribed the remedy"

Respectfully submitted,

GUY H TURRELL, *President*

April 15, 1929

REPORT OF THIRD DISTRICT BRANCH

To the House of Delegates—

Gentlemen

The past year has been a quiet but progressive one for the Third District Branch of the Medical Society of the State of New York and the ending of the year finds all the component county societies in a healthy and growing condition and more active than at the commencement of the year

At the Annual Meeting of the State Society, held in Albany in May, the members of the Third District Branch assisted the members of the Albany County Medical Society in acting as hosts to the State Society

The Annual Meeting of the Branch was held at the Hudson Country Club, as guests of the Columbia County Medical Society, the last week in September Addresses were given by Dr Trick, the President of the State Society, and Dr Daniel Dougherty, Secretary State Society The morning was devoted to the scientific program, after which a clam bake was served by the Country Club and addresses made by Drs Sadlier and Ross of the Public Relations Committee on some plans of the work of that committee, and by Dr Card on malpractice insurance

About one hundred and thirty members were present and registered At the Business Meeting the present officers were re-elected for another term

There have been several meetings of the Executive Committee held, at which the affairs of the Branch were thoroughly discussed

Several of the component societies have availed themselves of the courses offered by the Committee on Public Health and Medical Education of the Medical Society of the State of New York with gratifying success

In common with the other District Branches there seems to be a re-awakening of interest in the affairs of the Branch and the members are beginning to realize that the District Branch has a distinct field of usefulness in the scheme of organization of the State Society

Respectfully submitted,

EDGAR A VANDER VEER

April 15, 1929

REPORT OF THE FOURTH DISTRICT BRANCH

To the House of Delegates—

Gentlemen

During the past year the regular meetings of the County Societies comprising the Fourth District Branch have been well attended and the scientific programs have been exceptionally valuable and interesting

In six counties post-graduate lectures have been given in four counties none were given

The societies of Schenectady, Montgomery and Fulton counties lead in the number and variety of post-graduate lectures attended Montgomery county also has the distinction of having a 100 per cent membership.

At the semi-annual meeting of the Schenectady County Society it was voted to create a Professorship in Chemistry at the Albany Medical College, the money raised in Schenectady for the endowment of the college to be applied to this chair and to be named in honor of Dr William L Pearson

Clinton County Society at its annual meeting appointed a committee to undertake a study of conditions surrounding maternity for the year 1929

The membership of the Fourth District Branch has been increased during the past year by 18 new members, decreased by the death of 13, and 3 removals

The annual meeting was held in October at Ogdensburg, St Lawrence County Considering the fact that this location necessitated for many a considerable distance to travel, the meeting was well attended

The meeting occupied a portion of two days The afternoon session of the first day was held at the St Lawrence State Hospital and at this meeting several interesting mental cases were exhibited by the Staff of the Hospital

In the evening the District members were entertained at a dinner at the Golf Club as guests of the St Lawrence County Society

The scientific program was continued in the forenoon of the second day at the Golf Club

LYMAN G BARTON, *President*

April 15, 1929

REPORT OF THE FIFTH DISTRICT BRANCH

To the House of Delegates—

Gentlemen

In the Fifth District, practically every society is in a thriving condition, as measured by the number of meetings and attendance. Jefferson has been holding monthly meetings for the past two years, and Onondaga is now changing from quarterly to monthly meetings Jefferson, with eighty-five members, has an average attendance of

thirty-five, at post-graduate lectures, they average forty-five From the observation of this group of counties it appears that the oftener the meetings the greater the interest in the society

Post-graduate courses appear to have done more than any other one thing to arouse interest The men appreciate the value of these courses and the convenience of having them at home Nearly all counties are having a course every year Lewis County has only fourteen members so that group joins with Jefferson These courses are a wonderful boon to the men in the rural sections, in that they bring up-to-date teaching within reach

Diphtheria work is progressing, but in many places the general men have not yet found the way of cooperating with health officers and lay organizations in immunization work Apparently this is a problem every county society must solve for itself, it demands more interest, if doctors are to retain the work that properly belongs to them

Herkimer and Oswego Counties are working for county laboratories

Oswego and Jefferson are lending encouragement to health camps and their members are helping to direct these activities

Oneida has a public relations committee that is doing splendid work under the chairmanship of Dr Thomas Farrell They are cooperating with the county tuberculosis committee and the departments of health and education in a survey of physically handicapped children They are united on the recommendation that outside men be *not* invited to conduct clinics they are willing to assume this responsibility themselves

Our annual meeting was held in Utica, October ninth The attendance was not what it should have been, only 112 being registered, but interest was keen and it was a very successful meeting A paper on "Ear Infections in Children," by Dr. McAskill of Watertown, and another on "Skin Diseases" with lantern slides by Dr Howard Fox of New York, were of special interest Important messages were brought to us by the President and other officers of the State Society

Respectfully submitted,

PAIGE E THORNHILL, *President*

April 15, 1929

REPORT OF PRESIDENT OF SIXTH DISTRICT BRANCH

To the House of Delegates—

Gentlemen

As President of the Sixth District Branch of the Medical Society of the State of New York, I respectfully report as follows

The Executive Committee of the Sixth District Branch of the Medical Society of the State of New York, and the Presidents of the component County Societies of the Branch, and Dr Joseph S Lawrence Executive Officer of the State Society, and Dr Reeve B Howland of Elmira, at the invitation of the President, attended a luncheon at the Elmira City Club June 12, 1928, for the purpose of discussing the condition of the District and formulating plans for the Annual Meeting

An invitation was received from the Arnot-Ogden Memorial, and the Chemung County Medical Society, to hold the Annual Meeting at the Hospital, as their guests, which was accepted At the Annual Meeting, held Sept 25, there were in attendance 205 registered physicians, the largest in the history of our Branch Meetings, and the largest attendance, in proportion to membership, of any District in the State

During the year Steuben County was transferred to the Seventh Branch leaving the Sixth Branch with 9 Counties with a membership of 391 the smallest in the State, Binghamton and Elmira being the two larger cities in the District.

The program was unusually attractive, every speaker and discusser was present, and everything was carried out on schedule time For detail account see the *State Journal* of Oct 15, 1928

The District was honored by having as guests Dr Harry B Trick, President of the State Society, Dr Daniel S Dougherty, Secretary, Dr John A Card, Speaker of the House of Delegates, Dr James E Sadlier, Ex-President and Chairman of the Committee on Public Relations, and Dr Joseph S Lawrence, Executive Officer of the State Society Each spoke briefly on State matters following the luncheon

The County Societies in the District are all active and awake, and most of them are on the program for Post-Graduate Courses and taking an active part on County Public Health Committees

The number of active physicians in the District not members of the County Society is very small In Chemung County, having some 70 active physicians, only three are not affiliated with the County Society, and they are advanced in years

Respectfully submitted,

LARUE COLEGROVE, *President*

REPORT OF THE SEVENTH DISTRICT BRANCH

To the House of Delegates—

Gentlemen

A meeting of the Seventh District Branch of the Medical Society of the State of New York was held at the Oak Hill Country Club on Thursday, September 27 and was attended by nearly three hundred members of the medical profession

The meeting was called to order by Dr Austin G Morris, President, at 11 00 a m The first paper was read by Dr Wardner D Ayer of Syracuse on Poliomyelitis After thorough discussion of this paper the meeting was adjourned for luncheon and 210 physicians partook of a bountiful buffet luncheon served in the spacious dining room of the Oak Hill Country Club

Following the luncheon the meeting was addressed by Dr Harry Trick, President of the Medical Society of the State of New York, Dr D S Dougherty, secretary of the Medical Society of the State of New York, Dr John A Card, vice-speaker of the Medical Society of the State of New York, Dr James E Sadlier, former President and Dr Thomas Farmer, Chairman of the Committee on Public Health and Medical Education

The first paper of the afternoon was read by Dr Emil Novak of Baltimore, Md , his subject being Differential Diagnosis of Menopausal and Post-Menopausal Hemorrhages The second paper was read by Dr Carl Wiggers, Professor of Physiology in Western Reserve Medical College, his subject being Laboratory and Clinical Methods for Cardiovascular Studies—Suggestions for Better Inter-Relations The last paper was read by Dr John de J Pemberton of Rochester, Minnesota, it being a Discussion on Problems of Surgery of the Thyroid All of the scientific papers were well received and thoroughly discussed

We were fortunate in securing such outstanding men on this program Considerable difficulty however, was encountered in getting together this group of men to address this meeting, and I would strongly recommend to all District Branch Presidents that they complete their program as early in the spring as possible before the vacation months as it is difficult to get information from doctors during the months of July and August

Respectfully submitted,

AUSTIN G MORRIS

REPORT OF THE EIGHTH DISTRICT BRANCH

To the House of Delegates—

Gentlemen

After several meetings had been held with the cooperation of Dr Lawrence, the Eighth District Branch held its meeting on Tuesday, October 2, 1928, at the Buffalo City Hospital There were about two hundred in attendance

The morning was given to demonstrations in sections by different members of the City Hospital staff to the visiting members This program was brought to a close by a clinico-pathologic conference in which different members of the staff participated

In the afternoon our program consisted of addresses by Doctors Trick and Card Unfortunately, Dr Dougherty telegraphed that he was unable to be present. The scientific program was given by Dr William D Johnson of Batavia, Dr Charles B Handel of Buffalo and Dr J Henry Dowd also of Buffalo

Follow-up letters to the out-of-town members were sent about a week after the meeting regarding constructive criticism to be of assistance in preparing the 1929 meeting

The aims for our 1928 meeting were

(a) To hold the meeting in a large, well equipped hospital

(b) To furnish access to any branch of medical activity that was desired

(c) To furnish an adequate lunch upon the premises to save time and inconvenience to visiting members

(d) To furnish an afternoon program that would stimulate interest and acquaint the members with the different activities of the State Society

(e) To complete the day's work with a scientific program of a practical character

Judging from the return letters received, we feel that these objects were accomplished

Respectfully submitted,

THOMAS J WALSH, *President*

April 15, 1929

thirty-five, at post-graduate lectures, they average forty-five From the observation of this group of counties it appears that the oftener the meetings the greater the interest in the society

Post-graduate courses appear to have done more than any other one thing to arouse interest The men appreciate the value of these courses and the convenience of having them at home Nearly all counties are having a course every year Lewis County has only fourteen members so that group joins with Jefferson These courses are a wonderful boon to the men in the rural sections, in that they bring up-to-date teaching within reach

Diphtheria work is progressing, but in many places the general men have not yet found the way of cooperating with health officers and lay organizations in immunization work Apparently this is a problem every county society must solve for itself, it demands more interest, if doctors are to retain the work that properly belongs to them.

Herkimer and Oswego Counties are working for county laboratories

Oswego and Jefferson are lending encouragement to health camps and their members are helping to direct these activities

Oneida has a public relations committee that is doing splendid work under the chairmanship of Dr Thomas Farrell They are cooperating with the county tuberculosis committee and the departments of health and education in a survey of physically handicapped children They are united on the recommendation that outside men be *not* invited to conduct clinics they are willing to assume this responsibility themselves

Our annual meeting was held in Utica, October ninth The attendance was not what it should have been, only 112 being registered, but interest was keen and it was a very successful meeting A paper on "Ear Infections in Children," by Dr. McAskill of Watertown, and another on "Skin Diseases" with lantern slides by Dr Howard Fox of New York, were of special interest. Important messages were brought to us by the President and other officers of the State Society

Respectfully submitted,

PAIGE E THORNHILL, *President*

apparatus and the ability to use it without jeopardy to either recipient or donor Then, again, transfusion, even in the most competent hands, is not free from severe, alarming and even fatal reactions in septic cases All this, of course, without decrying its very distinct value The injection of milk would be ideal if it were not for one thing—milk is not sterile and the formation of severe abscesses is not uncommon

While discussing these reactions following transfusion, with Dr J R. Goodall, of Montreal, he said that for some time he had been using daily subcutaneous injections of unmatched blood in the treatment of these cases with uniformly good results His idea seemed to be that blood gave the same serum reaction as milk with the resultant leukocyte stimulation, that a certain number of antibodies were present, and that a small amount of hemoglobin was also obtained Of course, if the patient is suffering from a marked anemia, this method cannot be as efficacious as transfusion

The technic is simple All that is required is a 10 c c syringe, a needle and a tourniquet Matching is not necessary, and I believe that the best results are obtained when the blood does not match Certainly it seems rational to believe that unmatched blood will give more of a protein reaction than matched blood Ten c c of blood are withdrawn from the arm of any individual—relative or friend, quickly carried to the patient and injected into the gluteal muscles, the thigh or, in stout individuals into the subcutaneous fat I have sometimes thought that better results were obtained when blood was taken from several different donors

As far as I know, Dr Goodall has not reported his cases However, since he made his suggestion we have treated 23 cases in this way with satisfactory results The number of cases reported is, of course, too small to warrant our drawing any definite conclusions, but they are offered in the hope that others may wish to employ this method and that ultimately we may gather enough data to either justify or condemn this procedure. Of course, as in any infectious disease many patients get well without any treatment whatever, and it is impossible to say that any one drug or method has been responsible for the recovery of the patient However, we think that these patients have been benefited by these injections and in many of them markedly so

Three of our cases died—one three days and another seven days after admission Both of these had blood-stream infections without local exudate The first had only 6,200 leukocytes and the second had 13,400 The third case was a septic abortion admitted on July 3, 1925, and died on the 27th Her leukocytes increased from 13,000 to 30,000, but the infection invaded the peritoneum and she died of peritonitis

I am indebted to Dr V P Mazzola for searching the records and preparing the charts for photography

PREOPERATIVE CARE FOR THE SUPPOSEDLY FIT*

By WLLIAM A. GROAT, M D, SYRACUSE, N Y

THE internist views the recent progress of surgery as a succession of remarkable achievements You are more familiar than I with the development of surgical technique, the newer operations of extreme delicacy, the boldness, and the opening of new surgical fields We internists look with particular favor upon the improvement in treatment of impaired surgical risks Thyroid surgery has been greatly advanced by the use of rest, sedatives and iodine, permitting single stage operations and in general yielding better results in shorter time Insulin has changed the surgery of diabetic gangrene and general operative procedures in diabetics With the advent of this remarkable gift to medical science, the hesitancy, the fear in undertaking major surgery in a diabetic has been removed from the surgical mind Such improvements as the better understanding of fluid balance, of cardiac sufficiency and insufficiency, and what not, have given surgery greater scope With proper preparation cases that ten years ago would have been considered inoperable become reasonable surgical risks No doubt many of you have had the experience of seeing the case which had been considered impaired so improved by preliminary treatment as to go through a severe surgical experience uneventfully to prompt recovery Many of you will go a step further with me and recall that you have seen impaired risks who have been carefully handled go through their surgical experience better than the supposedly fit who, without preparation, without rest, have gone to the operating table within a few hours after entrance into the hospial to be followed by a stormy postoperative period

This brings us to our topic, the supposedly fit. What preparation should bring the best results for the patient and the most comforting experience to the surgeon? For emergency surgery there is of course little choice We are not deal-

A PRELIMINARY REPORT ON THE SUBCUTANEOUS INJECTION OF BLOOD IN THE TREATMENT OF POST PARTUM INFECTION*

By GORDON GIBSON, M D, BROOKLYN, N Y
From the text of "Obstetrics and Gynecology, Long Island College Hospital."

MAY we be permitted to suggest that post partum sepsis may, in a way, be considered as an infectious disease, in that it is due to the invasion of the human body by a pathogenic organism, as is also pneumonia, typhoid fever, diphtheria, scarlet fever, etc ? If this be so, we then can ask ourselves the same three questions that are asked in the presence of any infectious disease, pneumonia for instance 1 What is this infection doing to this patient? 2 What is the patient doing to combat this infection? 3 What can we do to aid this patient to combat this infection?

Let us assume that puerperal infections may be divided into two great types, depending upon the portal of entrance of the organism, puerperal wound infections, and infections through the placental site In the former two things may happen 1 The infecting organism may be so virulent or the resistance of the individual so low that the organisms pass rapidly through the lymphatics into the blood-stream with the resulting early bacteremia 2 That the infecting organism is of such low virulence, or the powers of resistance of the individual so great that the infection is limited to the parametrium This, then, is the same phenomenon that occurs whenever any infecting organism invades any wound of the body, no matter where it may be This response of the individual to the invasion of the infecting organism is inflammation and results in the formation of an exudate or phlegmon entirely analogous to cellulitis in any part of the body, differing only in that it is often greater because of the richness of the lymphatic supply and the looseness of the pelvic cellular tissue

We can differentiate between these two classes by certain clinical manifestations—the severe toxemia, the depth of the prostration, the degree of anemia, the presence or absence of a leukocytosis as revealed by the blood count, the presence or absence of an exudate in the parametrium as revealed by careful pelvic examination, and the presence or absence of bacteria in the blood-stream as shown by repeated blood cultures

In the first of these two types, then, we find early and marked toxemia, generally a low polynuclear leukocyte count, absence of exudate in the parametrium, and early positive blood cultures The prognosis in this type is, of course, extremely grave In the second type there is moderate toxemia, a high polynuclear count, an exudate in the parametrium and negative blood cultures

In the second great type of infection, i e., infections through the placental site, we find a very definite pathology At first there is an infected thrombus in either the ovarian or the uterine vein Later as this thrombus liquefies, generally because of the action of the contained bacteria, organisms are liberated into the blood-stream with resulting bacteremia or septic emboli, which are scattered to various parts of the body, forming septic infarcts and multiple abscesses

In both types of infection, then, whether the infection be through a wound in the birth canal or through the open placental sinuses, the course of the disease depends upon the balance between the virulence of the organism and the resistance of the individual to the organism

Briefly and without delving too deeply into the realm of serology, we, as clinicians, may consider that resistance or immunity to bacterial invasion depends upon two factors—the presence in the blood serum of certain immune substances or antibodies, and the ability of the hemopoetic structures to rapidly furnish and pour into the blood-stream a large number of polynuclear leukocytes and, as Wolfe, of our clinic, has stated, the leukocytes must be considered as the shock troops in this combat.

As we as yet have nothing at our disposal to aid in lessening the virulence of the invading organism, the intravenous injection of various dyes having been in our hands rather unsatisfactory, our attention must obviously be directed towards an effort at increasing the resistance of the individual Polak, in 1913, advocated transfusion with the idea of supplying antibodies, stimulating leukocytosis and raising the hemoglobin Gellhorn, in 1922, advocated the injection of milk into the muscles, thereby stimulating leukocytosis by means of the foreign proteid reaction Many papers have been presented within recent years, with which you are all familiar, and I daresay you have all used both these methods with considerable success

We have not sufficient time at our disposal today to go into the details of the science of this subject and the seeker for further knowledge is referred to Petersen's "Protein Therapy and Nonspecific Resistance," published in 1922

However, both these procedures have very definite disadvantages Transfusion requires the presence of an individual competent to properly match bloods, possessing the proper

* Read at the Annual Meeting of the Medical Society of the State of New York at Albany, May 23 1928.

hydrate shortage and particularly in children The carbohydrate reserve under the best conditions is for but 24 hours To go beyond that period, valuable structures must be torn down for fuel purposes This adds a metabolic load and may start a serious metabolic disturbance evidenced by postoperative nausea, vomiting and so-called acidosis The administration of alkali does not replace this deficiency in carbohydrate There is such a thing as deficiency in alkali but it is comparatively rare and not to be expected in the supposedly fit having proper food and fluid intake

Fluid balance must be maintained Any preoperative fluid deficiency increases postoperative difficulties

I see no reason for preliminary medication as a routine other than for purpose of anesthesia or rest I ban cathartics, heart stimulants and so-called tonics

As a summary I would emphasize that the surgeon forewarned in various types of definitely crippled risks waits and prepares his patient The cardiac cripple through prolonged rest or rest and digitalis becomes a good surgical risk and surprises everyone with the serenity of his course, the hyperthyroid through prolonged rest or rest with iodin from inoperable becomes operable and in the skilful hands of surgeon and anesthetist comes through, the diabetic dying in the past through lack of resistance in a surgical crisis, with rest and insulin and careful building up of carbohydrate reserve safeguarding against ketosis becomes eligible for the heaviest major surgery The loss of any such an one would not strain the confidence of the laity in medical science, yet with proper and particular care they surprise even the surgeon with their resistance and low mortality rate

Contrasted with these is the healthy looking child, the robust business man, the wife who has borne several children and commands her household, assumed to be what they are not and asked to accept hazard to which none need be subjected, going to the hospital without preparation, without rest, without an insight into the little things which if stopped are harmless, tired, nervous, overwrought, enter of an evening to be operated upon the next morning, bleed or fail to urinate, collapse, die Unnecessary and therefore inexcusable

We are misled by percentages The operative mortality in this class is low, abused though they be The economic loss is nevertheless great It has been demonstrated that a few days preliminary rest effects an even greater saving in days and dollars in convalescence The elimination of unexpected complications such as bleeding, nausea, insomnia, pulmonary infections through detection of incipient colds, kidney failure and so on, erroneously passed off as unavoidable accidents, is an element The occasional life saved, infrequent though it be, is reason enough

Rest is the best single therapeutic agent we possess For the crippled heart, the cardiologist recognizes rest first For the hyperthyroid, the impaired kidney, the neurotic, there is no better remedy One who believes in the two-stage operation for prostectomy recently told me it is his opinion suprapubic drainage does most for the patient through the rest which it permits

In any acute illness, failure to rest is detrimental and may be the immediate cause of death The "walking typhoid," the influenza patient who tries to "keep up" greatly diminishes chances for recovery

No matter how carefully the anesthetic is given or what it be, no matter what type of infection there may be present or what involvement there may be of the gastro-intestinal tract, the liver bears a new burden

The liver is the great central, most important organ in the metabolism Digested food is stored there, metabolites are reformed, pigment formation is an important function, whenever there is disturbance of sugar metabolism the liver is concerned When we impose rest and simple carbohydrate diet, we bring liver relief

With rest of proper type, the heart rate is lowered, the urine output is less, the food requirement is less, the digestive processes are slowed, the metabolic rate falls and the temperature reaches its low peak All these are beneficial and a prerequisite for a surgical operation

In the end, having done these things thoroughly and well, having made the tribute to scientific medicine, and practiced therewith the art of the true physician, even though we fail, there is satisfaction, there is comfort, there is peace We will have done all we should for our patient, and he will have had his chance

---

SHOULD SYPHILIS BE TREATED ONLY BY SPECIALISTS

By WALTER J HIGHMAN, M D, NEW YORK CITY

BEING a specialist, and having devoted myself largely to problems of syphilis, it will be assumed that this paper will be an unqualified affirmative reply to the question raised in the title Specialists should, of course, be better able than non-specialists to treat syphilis well, but many of the latter, nevertheless, are good syphilologists If the problem stated were Should syphilis be treated only by syphilologists? the answer would be the word, "yes" The point of departure then would be, as it is anyway, the definition of a syphilologist

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y May 23, 1928.

ing with such in this paper What must be done shall be done My particular topic is represented by the active man of affairs requiring an operation of choice for his betterment Too many of these in my opinion are taken to the hospital without preparation, perhaps superficially examined, perhaps not at all, just assumed to be fit from their appearance and declaration of good health otherwise After operation comes a prolonged convalescence in one actually fit but not properly rested and prepared, only after operation are discovered the few, who, due to some slumbering defect which might have been mitigated and guarded against, are exposed to extra hazard and prolonged disability from serious complications, ending even in death One such case per year in a hospital, one such case in a surgeon's lifetime, aside from the injustice to the individual patient does excessive, unmeasurable harm to surgery and to medicine as a whole The unnecessary sacrifice of time and money to the many and the occasional loss of life amounts in the aggregate to great economic loss If a thousand men supposedly fit devote an additional 24 hours to a proper physical examination, rest and dietetic preparation for their operative procedure, scarcely one of them will fail to save more than a day in his convalescence, some of them will save weeks and a very few life itself

From the standpoint of the internist the preparation required for any surgical procedure not an emergency is

1—A careful and complete history and physical examination including an examination of the blood and urine, not just a sketch to get by with the Hospital Historian, this to be made by one skilled in such procedure

2—There should be a lightening of labor for a few days preceding entrance into the hospital and at least 24 to 48 hours rest therein prior to operation Rest should continue until the patient is settled in his environment Sleep may properly be secured by the use of some one of the modern drugs of the barbital group

3—During this rest period the diet should be low in protein and fat but ample in carbohydrate of simple nature and this carbohydrate feeding should be carried up to the morning of operation, the last feeding to be of the simplest carbohydrate one hour prior to the preliminary hypodermic injection

4—During this observation period the fluid intake and output is to be measured and the intake so adjusted that there be no fluid deficiency at the time of the last feeding The lower bowel may be cleared by simple enemata. The final physical checkup of heart and lungs, fluid balance and relief from fatigue should be made the morning of the operation.

5—The internist or other who makes this physical survey should have a voice in fixing the time of operation, selection of anesthetic and scope of the procedure, the operation being understood to be one of choice

By experience we know that the following of this simple routine brings about the result and the saving to which we have already referred

Following a complete physical examination of those supposedly fit, there will be revealed a small percentage in whom notable defects are found and all such are, at least for the time being, to be considered unfit They must be specially prepared if still to be operated upon We can but suggest who some of these may be There is the child for tonsillectomy who has albumin or sugar in the urine, who has a pronlonged bleeding time, or who suggests status lymphaticus There is the robust appearing business man who has a weak and rapid heart, or a high blood pressure, or albumin in his urine, or is just dead tired There is the woman with pelvic symptoms who has hyperthyroidism and the woman with symptoms of hyperthyroidism who has pelvic disease, and many others who have distinctly one thing and also something else which either is a bar, temporarily at least, to surgical procedure or might need separate attention

There will remain a larger number in whom the physical examination shows no important defect. The supposedly fit remains supposedly fit But physical diagnosis has limitations Even if no important defects are revealed, it is not fair to the human organism, fair to surgical technique, fair to the anesthetist, or fair to the hospital in which the operative treatment is to be exhibited to have a man leave his office in the afternoon to enter a hospital for an operation the next morning, or for a child to go from the schoolroom to the operating room for tonsillectomy The so-called surgical accidents among this class are sometimes due to an effort to save a few hours or a few dollars in the preliminary, thereby sacrificing many days, many dollars or even life in the postoperative period

We therefore say that adults supposedly fit who have had a thorough physical examination which reveals no excluding defect, should have rest in bed and accommodation to hospital environment, varying from a day for minor operations to at least three or four days for the major ones The preliminary rest for the child for tonsillectomy can be obtained at home with intelligent cooperation of the parent and perhaps better so For the adult even there may be a rest period at home but there is benefit for all to be acquired by residence in hospital where diagnostic procedures may be reviewed, where diet may be measured and fully controlled and the patient become accustomed to hospital life before the most trying period has arrived

It is of great importance that a sufficient amount of carbohydrate be fed previous to operation whenever possible A goodly percentage of postoperative ketosis is due to starvation or carbo-

varying the drugs to be administered under the infinitely shifting conditions of the disease, better keyed to the subtleties pertaining to the length, quality and quantity of the treatment He is, in a word, an expert artisan ready to cooperate with any other general or special physician into whose domain the outstanding features of the particular case brings it To escape being merely mechanical he must also possess that breadth of understanding of the disease that will place him on an easy footing with the others He must be able to function intellectually as any of the others function, but not necessarily as to diagnostic minutiae Should the patient consult him first he must know when to confer with such or all of the others as may have to be called upon to fill in the gaps his limitations would otherwise leave open

The range of the arsenicals, mercurials, bismuth preparations, the use of the iodides, that of the malaria treatment, how to perform the lumbar or cisternic puncture, how to administer treatment, whether by mouth, intravenously, intramuscularly, hypodermically, subdurally, and when, and how, and how often, and for how long Such decisions require first rate understanding and no little skill If he is only an artisan he is considerably short of the optimum If he is everything he should be he is a physician of rare temper But he is not occult. Almost anyone can be such a physician if his talents, taste and training are so directed If there is such a thing as a syphilologist, this is he, provided his clinical attainments thereunto added are sufficient to endow him with the greatest sum possible of general as well as technical knowledge

There are a great many men of this type in the world, and it goes without saying that these are the ones best qualified to handle the disease not only as to the welfare of the syphilitic, but also as to that of the community But are there enough to meet the community's demands? The answer clearly is no In the United States, for example, there must be between three and five million syphilitics There are roughly about a hundred and fifty thousand physicians, and, of these, not more than a thousand are experts in the sense indicated The ratio of such experts to syphilitics is roughly estimable at one to five thousand, but assuming the figures to be incorrect, and that the ratio be one to two thousand, a syphilitic paying fifty calls a year, each specialist would have an annual number of a hundred thousand office visits, or three hundred a working day The utmost a single individual could treat daily would be fifty patients, thus twenty times the number of physicians hypothetically available, or from twenty to forty thousand physicians are necessary to treat our syphilitics, that is, roughly an eighth to a fourth of our medical population

On the face of it, then, syphilis cannot be treated only by specialists, but likewise, on the face of it there should be more syphilologists And by this I mean men adequately trained in syphilis to treat the disease under ordinary circumstances, in the same way that average physicians are equipped in midwifery well enough to take their place side by side with obstetricians This can be encompassed The commonwealth needs a minimum of twenty thousand physicians properly trained to meet the situation at all and to meet it effectively, all physicians should be so trained How to do this is an educational problem

Syphilis is no respecter of districts It is present in the largest cities and the tiniest hamlets, in the first with its highly trained specialists and numerous well trained general practitioners, in the second with its combination physicians and surgeons who must be prepared to diagnosticate and treat everything These frontiersmen who live and die unsung are the "mute inglorious Miltons" of medicine They merit none of the condescension bestowed upon them, whatever their delinquencies, when they are compared with their urban cousins They are doing the best they can under circumstances so arduous that no metropolitan practitioner can grasp them Further than this their clientele is unsophisticated if not ignorant, thus an infectious syphilitic in a rural community is a greater menace than one in a town or city

In cities patients are divided into two groups, those whose material circumstances determine institutional, and those whose material circumstances determine private treatment, whatever the disease, including syphilis The same qualified physicians tend to treat both of these groups There is a subdivision of the second group, however, the moderately well to do who privately consult physicians whose fees are within their means Without reflection on physicians commanding lower fees it remains a fact, nevertheless, that economic exigencies impel them often to treat patients who would be better treated either if they were in the wealthier or in the institutional class It is an economic misfortune that patients in this group are ground, together with the physicians they consult, between the upper and lower millstone If there is any condemnation herein implied it is of society rather than of individuals, nor is the economic solution apparent.

In rural districts the quality of medicine practiced is often high, but often no higher than that among poor but not indigent city dwellers This, too, may be a matter of economics, but it is just as much one of harried, overburdened practitioners limited by having to serve a public isolated from enlightenment The fact is stated with admiration for the first, and sorrow and sympathy for the second So far as the treatment of syphilis is concerned, fortunately our popula-

Perhaps first should be stated what he is not then, what he is He is not the elect of the gods He is not, withal, a demigod capable of supernal flight He is not a superman, or even a plain man with extraordinary talents He has not acquired secrets or skill out of reach of anyone else willing to concentrate upon getting them He is merely a man with as complete understanding of syphilis as may be had A specialist in syphilis may become so endowed even if he be only persevering, for his field is reduced to the mastery of one disease Any physician may master one disease among several, but the abler he is the more diseases is it possible for him to master Individuality is the determining factor A brilliant man focusing upon a single disease should outstrip the other two types Nevertheless, all three are syphilologists, and the second is quite as justified in treating syphilis as the two examples of specialist

But this is not the whole story If Osler's aphorism is true, that to know syphilis is to know medicine, it is conversely true that not to know syphilis is not to know medicine It is assumed that physicians know medicine, at least such a guaranty is implied to the public when universities confer the practitioner's degree, and commonwealths the practitioner's license Hence it follows that licensed doctors of medicine are expected to possess a working knowledge of syphilis, that is, they are expected to be elementary syphilologists If this conclusion is justified, the present essay should end here

The present essay, however, will not end here It will, on the contrary, point out what syphilologists actually should be, and attempt to prove that none other should treat syphilis, save under exceptional circumstances Syphilologists should know what is known of syphilis, and should have mastered the technique of treating it It may be desirable to include in the theoretical phase of such knowledge conversance with the history and the voluminous literature of the subject, but this is not mandatory What is mandatory is thorough familiarity with the practical aspects of the symptoms and signs of the disease, so that, within human bounds, accuracy will be approached in diagnosis, treatment, and prognosis It is this with which medical schools should feel bound to equip students, not abstractions and test tube sophistication

Syphilis involves all tissues and its symptomatology inevitably includes manifestations that are in part general and in part referable to the special organs involved A perfect syphilologist would be perfect in his knowledge of diseases of the skin, eye, ear, nervous system, thorax, abdomen, skeleton, muscles and visible orifices He would be an embryologist in order to master congenital syphilis, a serologist and parasitologist in order to master the laboratory aspects of the disease In short, he would be medically omniscient It is safe to state that that man remains to be born. Nor, for practical human needs, does he have to be born But who is the syphilologist? The expert in skin diseases, the expert in diseases of the eye, or of the nervous system, or one of the others? The correct answer is not ready My own would be anyone of these who, together with his special knowledge in his field has an equal knowledge of syphilis, in its related aspects If he has this latitude he is a syphilologist, in fact as to syphilis he is virtually a specialist

Further analysis is here desirable Recognition of the presence of syphilis depends first upon ability to appreciate its general and special manifestations, secondly upon interpretations of laboratory findings The significance, both diagnostic and prognostic, of laboratory findings is here included A sound conception of the nature, application and flaws in laboratory tests is implied The laboratory and clinical findings must be coordinated Whether it may be the neurologist and internist who first meet the case, and for further enlightenment consult the dermatologist and ophthalmologist, or whether the sequence is another one, one man alone, except in early disseminated syphilis, is inadequate to assemble all the data, and any one of these, or all of them together, must resort to the laboratory to gain more abstruse information To me the group is not visualized as a phalanx with one specialist at the apex, but as a circle with all specialists representing equally important points on the circumference Thus, it appears to me, that the concept of a syphilologist, per se, is absurd, as that of a specialist in any other one disease would be absurd Medicine cannot be so narrow If it could be, it would imply as a truth a patent intellectual error, namely that each disease could be identified without reference to other diseases Such identity can be established only through the process of differentiation, but if this process is necessary at once ultimate specialism collapses, and general medical knowledge is acknowledged as the only intellectual fundamental Admitting this quashes the case for the syphilologist as such

With reference to the treatment of syphilis, practical considerations differ materially from diagnosis and prognosis thereof in the same way that the surgeon's role differs from the internist's in operative conditions The surgeon is introduced upon the scene mainly for a technical skill which depends upon infinite repetition The therapist in syphilis plays an analogous part. He is more adept in the technique of treatment than his fellows, more experienced in combining and

heat in a body by the absorption of radiation is fluorescence if the heat is immediately radiated as infra red

The theories of fluorescence are too numerous and too complicated for the present consideration

The observations recorded herewith were made using a mercury vapor arc in quartz as a source of radiation, and a special filter G986A, made by Corning Glass Works, which permits the passage of ultraviolet to 2400 Angstrom units, and yet bars the visible radiation except for a modicum of visible violet To all intents and purposes, we have "black light."

In a dark room, the radiation of filtered ultraviolet striking the surface of the exposed body may result in

a The dark surface may suddenly appear very vivid in the dark room
b Some part of the dark surface may appear dark in contrast with the lighting up of the surrounding areas
c Nothing may appear to happen

Normal nails fluoresce in a vivid white in the dark room when placed in the range of the filtered ultraviolet. All horny processes give this pearl white fluorescence The teeth, if natural teeth, likewise give a singularly chalky white appearance The palms and soles of adults show this fluorescence, indicative of thickening of the horny layer Lesions such as warts, epidermal scales, fringes of scaly lesions, give the characteristic fluorescence of the horny layer Gray hair (canities) is very evident, as the depigmented hairs fluoresce very beautifully as extreme white The gray hairs show with startling vividness, in persons with beginning canities, whose greying hairs are few in number, and masked in ordinary light by the profusion of pigmented hairs

The exfoliation of exfoliative dermatitis demonstrates the fluorescence of the scales Follicular keratosis gives the typical keratin reaction

Blonde hair, if natural blonde, shows a multiplicity of colors in the dark of filtered ultraviolet, although in ordinary white light such a head of blonde hair might appear as one shade. Bleached blondes do not give the multiplicity of colors of their natural blonde sisters

Keratosis palmaris et plantaris, as is to be expected, shows as white under fluorescence

Leucoderma areas show even more startling white under filtered ultraviolet than in ordinary daylight The contrast between the leucoderma areas and the surrounding skin is very marked.

Hairs of the scalp infested with one or another variety of ringworm fungus fluoresce in the dark It is very easy to distinguish the infested hairs from the others Even if the hairs are removed from the scalp, the character of fluorescence persists We have also examined a number of cultures of ringworm organisms and others under filtered ultraviolet, and at some future time may be enabled to report some new characteristics

Microsporom furfur lesions of the skin (Pityriasis versi-color) glow with a dull golden yellow Scabs, scales, and crusts give the reaction of white, characteristic of epidermic reaction In the scalp this may be somewhat modified Greasy scales may appear yellowish

Verruca of all kinds shine glistening white

Acne lesions are seen as dark minute patches Scars of acne (as well as other scars) appear either violet, if very old scars, or as dark brown, if recent scars

Angiomas either flat or raised, appear very dark against the normal fluorescence of ordinary skin

Blebs and blisters with serous content appear grey in filtered ultraviolet

Carbuncle is seen as a dark patch against the already dark fluorescence of the surrounding normal skin

The conditions we call dermatitis, and those we call eczema both give dark smudge against the skin in fluorescence This inhibition of fluorescence of inflammatory reactions is constant

Erythema, likewise, gives a dark appearance

Freckles appear very dark indeed Persons who may show no freckles in ordinary light shows the same monotone dark as other inflammatory lesions

Melanoma is pitch dark under fluorescence. One patient showed fifty lesions of which two, indistinguishable in ordinary white light, were different under the filter in that they appeared to fluoresce vivid white Remember that they were dark as the others in daylight

Molluscum contagiosum is one of the lesions which inhibits fluorescence It appears dark in the filtered ultraviolet, except for the umbilication which gives the white of keratin

Nevus linearis, which is warty and pigmented, gives the discoloration of pigment, not the fluorescence of keratin

The marked limitations of the areas of recent or old sunburn from the adjacent unsunburned skin may be easily seen The sunburned areas stand out as uncompromisingly dark.

Urticaria, toxic eruptions, and others which go under similar names show the reaction of inflammatory disease The formation of a wheal was observed under fluorescence but other than the appearance of a dark streak under the successive points of pressure, nothing was gleaned

Xanthoma palpebrarum appears brown under fluorescence

tion is mainly urban, and to most of it first rate treatment is available, either in institutions or in private practice The other urban syphilitic population, together with that of rural districts, is less well situated as to treatment

We are now ready to dismiss part of the question raised in this paper In larger centres syphilitics should be treated by specialists, either privately or in institutions, whenever possible, but the term specialist is not used narrowly, and for it the word syphilologist should be substituted This arbitrary statement is ventured because an approximately sufficient number of adequately qualified physicians whatever they may be called, exists

Among the urban indigent, and in rural districts there is no possibility of finding the necessary number of syphilologists What then is to be done? Syphilitics must be treated, and who is to treat them if not the nearest physician? Certainly there are not enough Fourniers, Neissers and Wechselmanns to go round, but it becomes the duty of medical schools to see to it that syphilis is properly and simply taught to all students so that they may face even frontier practice with a working knowledge of the disease

New York State is sincerely straining itself to augment the pedantry of medical schools with practical sense, and something similar is within the scope of every commonwealth For the moment this is all that is needed It is foolish to fulminate about ethics as prophylaxis The truth involved is obvious, but human nature is still more obvious Syphilis cannot be encountered by retrospective moralizing, but can be met by physicians sufficiently prepared at least to draw its fangs

Nor should the fangs be too apocalyptically pictured It is enough for the patient to have the disease, and enough for the man in the street among physicians to be able to do the important immediate things necessary for its treatment Little as standardization appeals, standard instruction should be given where it is needed Gradually the problem will then be solved Befuddling physicians with recondite technicalities as to the recognition and treatment of the disease, a characteristic of much of the recent literature and oratory dealing with the theme, may exalt the already exalted, but brings no nearer to solution a pressing public problem

A specialist in syphilis is something too diaphanous for me to attempt to define My felicitations are extended to those syphilitics who can be treated by one A syphilologist is a being easier to describe He is a physician whose training qualifies him to grapple with syphilis He may be, but need not be, a specialist His ability may exist side by side with like ability respecting other diseases A syphilitic may safely entrust himself to one of these In addition there must be many other physicians, perhaps less favored, but still possessing sufficient knowledge of this one disease, together with their knowledge of others, to be serviceable therapists with regard to syphilis They may even resemble syphilologists more than mist resembles rain Finally there are many physicians who have not enough experience to justify their treating syphilis, just as many should not treat tuberculosis, or typhoid, or confine a woman or remove an appendix. Probably, save in emergencies, they rarely perpetrate such a delinquency

Should syphilis be treated only by specialists? Yes, when possible By well trained syphilologists when the first and academically higher order are not at hand By the next best group of practitioners if only such are available, provided they understand the essentials of the matter Never by those who have too little training In the final analysis the only consideration involvtd is that of the physician's conscience, and the public notwithstanding, this is usually of higher quality than is generally imagined No disease should be treated by any physician who does not feel reasonably qualified to undertake the enterprise This includes syphilis With relatively few syphilologists in the world, and with even fewer of the more exalted order called specialists in syphilis, the disease must be treated by physicians outside either category, even though it may be said of them as was said of the charging Light Brigade at Balaclava, "c'est magnifique, mais ce n'est pas la guerre?"

FLUORESCENCE CLINICAL AND BIOLOGICAL SIGNIFICANCE IN DEMATOLOGY *

By HERMAN GOODMAN, B S, M D., NEW YORK CITY

PHYSICISTS have given many definitions for fluorescence It suffices for us to recognize that fluorescence is the phenomenon associated with the absorption of light of one wave length, and its immediate emission at another wave length It is not essential that the exciting light be of shorter wave length than the emitting light, although such is usually the case It is possible for a substance to fluoresce in both shorter and longer wave lengths than the activating light radiation The short wave lengths of invisible ultraviolet may be detected by fluorescence of a substance in its path which becomes visible by reason of its longer wave length radiation in the visible zone On the other hand, the production of

SOME OBSERVATIONS ON THE NATURAL HISTORY OF ASTHMA IN CHILDHOOD*

By STEARNS S BULLEN, M D, ROCHESTER, N Y

FOR the purpose of this paper, I have considered a group of two hundred and thirty-five patients who began to have asthma at the ages of fifteen years and under They form part of a group of five hundred patients whose asthma began at all ages, and who were studied under the same conditions It seems fair, therefore, to compare this group of two hundred and thirty-five who had the onset in childhood with the remainder, two hundred and sixty-five, whose asthma occurred first in adult life

These patients were seen, in part, in private practice and, in part, in the Asthma Clinic in the Rochester General Hospital They, therefore, represent a cross-section of the social and economic life of the city of Rochester Only patients who have been followed for at least one year have been included Most of them have been followed for from two to five years

Those who had their first asthma in childhood consisted of 52 3% males and 47 7% females Those with the onset in adult life, 49 4% males, and 50 6% females Therefore, the whole group of five hundred were almost exactly divided between the sexes

Among the two hundred and thirty-five patients who had the onset of their asthma in childhood, 50 7% gave a definite family history of atopy Of the two hundred and sixty-five who had their first asthma in adult life only 28% gave such a family history

Spain and Cooke (1) studied a group of four hundred and sixty-two patients with asthma and hay fever, who presented positive skin reactions, and found that 58 4% gave a family history of atopy, while only 7% of a group of normal controls presented such a family history They show that in families in which there is a bi-lateral history of hyper-sensitiveness nearly three-fourths (71 6%) will eventually develop some form of atopy, and, in those families in which there is a unilateral history, more than one-half (56 1%) will develop such symptoms It would seem wise to keep this fact in mind when treating infants in families in which hyper-sensitiveness exists It is deserving of emphasis that the manifestations of hyper-sensitiveness in the offspring do not necessarily take the same form as that in which they appear in the ancestors

In the group of patients who had their first symptoms in childhood, 10 6% gave a history of antecedent eczema, and in the older group, less than 1% It is a well recognized fact that many children who have eczema in infancy later develop asthma I feel sure that these figures represent only about one-half of the number who actually had eczema This is probably accounted for by the fact that many of these patients were first seen after they had reached adult life, and did not know whether they had had eczema or not

These patients well illustrate the fact that asthma is essentially a long-drawn out condition Almost half (41%) had had recurring attacks for more than ten years at the time when first seen, and more than one-tenth (11 9%) had suffered intermittently for more than thirty years

There is no striking peculiarity as to race, except that individuals coming from the warm southern European countries tend to develop more respiratory tract infections than do the native born patients This seems especially true of the Italians, of whom Rochester has a large number Asthma, in these patients, is more liable to be on an infectious basis than that of hyper-sensitiveness to proteins

Many patients date their first attack of asthma from some one of the acute infectious diseases, such as whooping-cough or measles However, careful questioning will usually reveal the fact that the asthmatic attacks occurred some weeks or months after the acute infection I have been repeatedly impressed by the fact that asthmatic attacks seldom accompany the acute infection, and, indeed, they are apt to be less frequent for some weeks or months after such an acute infection.

Parents often state that their children have asthmatic attacks only when they "catch cold" However, these so-called "colds" almost invariably represent an upper respiratory tract manifestation of hyper-sensitiveness, in the same way that the hay fever syndrome presents its manifestations in the membrane of the nose and eyes

In many patients, the removal of diseased tonsils and adenoids has been liable to decrease the frequency of the attacks for a few weeks or months, but has had little permanent benefit This does not mean, of course, that patients presenting grossly diseased tonsils and adenoids should not have them removed, even though one cannot usually expect permanent relief from asthma by such operations

Infection of the para-nasal sinuses does occur, even in young children, and the treatment of such infections is important In this group, there have been only thirteen recognized cases of such infection. I believe that some cases of sinusitis were undiagnosed and that a more careful search would reveal evidence of such infection in a somewhat larger number

Parents often ask if their children who suffer

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y, May 23 1928

The skin of the colored person does not fluoresce, but inhibits fluorescence

The appearance of the skin of the colored person does not suggest the lack of fluorescence observed in areas of pigmented skin in white people

The skin of persons with well marked radiodermatitis, altered by the application of either radium or x-ray, is markedly fluorescent in patches and dark in others Examination of a number of persons under radiation therapy with either radium or x-ray discloses that it is possible to determine the time and amount of such radiation, and we believe that overdosage is detectable The following case (seen with Dr R Lewis) at the New York Skin and Cancer Hospital seems important

A child had a nevus on one side of the face including the ear Radium had been applied This was followed by a number of ulcerations resulting in scarring The resulting clinical appearance some time later was such as to lead to the conclusion that parts of the scarring were due to an excess dosage of radium Other parts were thought to be due to spontaneous ulcerations Examination under filtered ultraviolet radiation gave evidence that no part of the scarring was due to the application of radium, and that it was safe to proceed with its use

A young man was examined clinically, and it seemed evident that he had telangiectasia and scarring resulting from overexposure to roentgen ray applied for the removal of excessive hairs on the chest Examined under the filtered ultraviolet, no such reaction was visible as one gets with overdosage of x-radiation It was learned subsequenly that the scars were due to efforts at effacement of the telangiectasis with galvanic current

The results of erythema doses administered in the past may be made visible under filtered ultraviolet Thus, one of our roentgenologists was enabled to determine the extent of incipient roentgen ray changes in the dorsum of his hand, and was convinced that he should double his precautionary measures Another physician who has used the roentgen ray extensively, and with what he thought were adequate precautions, was enabled to see a keratotic lesion on his hand the existence of which he had never previously suspected

It appears that it should be possible to determine the upper limit of safe radium and x-ray dosage, and to foretell which patients may be exposed without undesired sequelae

It is possible to demonstrate the erythema (which will be evident in ordinary light some hours later) immediately after exposing the skin to the action of the radiation from the water cooled (clinical model) mercury vapor arc in quartz If a piece of glass is interposed which cuts off the erythema producing wave lengths, no erythema ensues, and examination under the filtered ultraviolet discloses no change Curiously, if the skin of a colored person is exposed to this radiation the area of skin so exposed fluoresces under the filtered ultraviolet radiation, which is the opposite of what happens to the skin of white persons It will soon be possible to determine accurately, within the limits of clinical observation, just how much exposure each patient requires for erythema production from any effective ultraviolet emanator

The presence of the normal pigment in the skin or in the hairs inhibits the fluorescence, as evidenced by the lack of fluorescence in the skin of colored persons, and in the pigmented blemishes of white people

If the pigment is absent as in canities, or in luecoderma, one gets vivid fluorescence Also if there is over-activity of the keratin layer, as in warts But if the pigment granules are present, they may inhibit even the excess fluorescence of keratin over-growth, as witness the lack of fluorescence of pigmented warty nevus

If pigment is present in normal white skin, it is possible to get a clinical sunburn, and under filtered ultraviolet, the area of sunburn is dark The skin of the colored person fluoresces at the site of erythema producing radiation from the mercury vapor arc in quartz, therapeutic model of water cooled apparatus

On the other hand, it is not possible to sunburn an area of skin from which all the pigment has been lost as, leucoderma Yet leucoderma is a lesion which fluoresces vividly

It seems difficult if not impossible to sunburn an area already sunburned Is the pigment a protective mechanism by accident of the ability to absorb radiation? Does leucoderma refuse to sunburn because all the radiation is immediately emitted as white light?

Is the upset of pigment forces marshalled as the result of overdosage of x-radiation responsible for the instability of overradiated skin?

It seems that as yet we have not sufficient material on which to speculate with any hope of reasonable success Experiments with filtered radiation from various sources must yet be carried on The chapter on Filtered Ultraviolet Radiation in my book, "Basis of Light in Therapy," may be consulted by the interested reader Some day finished experiments in the use of chemical sensitizers may be perfected, or hopefully, clinical sources of monochromatic radiation will be available so that we may no longer have to bombard the cutaneous envelope with a gunshot mixture of energies of various velocities

I close with the expression that the study of the skin under filtered ultraviolet radiation stimulates, and occasionally, aids the student of dermatology, and dermatopathology

first symptoms after the age of fifteen

The demonstration of one or more positive skin reactions does not mean, of course, that nothing else about the patient must be considered in bringing about relief It does, however, present a means of making a specific diagnosis, and, when considered in connection with all other factors, offers a definite, specific method for the treatment of this distressing condition

Number of Positive Skin Reactions to substances used in tests

The one hundred and eighty-eight patients presented four hundred and sixty-five positive skin reactions, many reacting with several different substances The greatest number of reactions occurred with foods (220) or almost 50% of the total The animal epidermal preparations came next, with the pollens in third place Of the foods, egg, wheat and peanut top the list. Milk was not a very common offender in this group

Of the epidermals, horse dander and goose feathers were the most frequent offenders Patients may come in contact with horse hair and dander, not only from the animal itself, but in hair mattresses, and on the clothing of members of the family who may happen to be in contact with horses Feathers are used in pillows, feather beds, down quilts, etc

Orris powder deserves special mention, because it is used in so many cosmetic preparations It was shown to be of importance in only two boys The remainder of the positive reactions occurred in girls who used liberal quantities of face powder Orris is used especially in the violet scented preparations Because it comes into such close contact with the upper respiratory tract and is used so continuously, the amount inhaled may reach considerable proportions

Cottonseed was not a frequent offender, but in the two cases in which it caused symptoms, it was found in the cotton mattresses used in the cribs of infants The improvements, after the replacement of the cotton mattresses with some stuffed with silk floss, was quite dramatic

The pollens do not usually cause symptoms throughout the year But occasionally asthma, starting in the pollen season, will continue for weeks or months after the air is free from the pollen grains

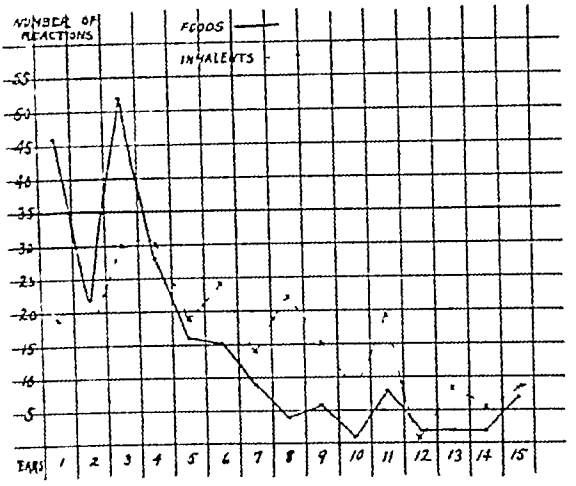

CHART 4

Number of reactions with Foods and Inhalants by one year groups, the years representing ages of Onset

Chart No 4 shows the number of reactions which occurred in these one hundred and eighty-eight patients by years, the years representing the ages of onset of asthma The curve for the food reactions parallels the percentage curve for the age of onset for the first three years, with a high peak (45) in the first year, a moderate fall in the second year and the highest peak (52) of all in the third year Thereafter the fall is very rapid, and only a small number of these patients who began to have asthma in later childhood present evidence of food hyper-sensitiveness The curve for the inhalants starts at half the height (19) of the food curve, and reaches its peak (30) in

from asthma are liable to develop tuberculosis In this group of patients, many of whom have suffered from asthma for many years, only four present definite evidence of tuberculosis, and, in these, the tuberculous involvement has been of the non-active, or very slowly progressing fibrotic type

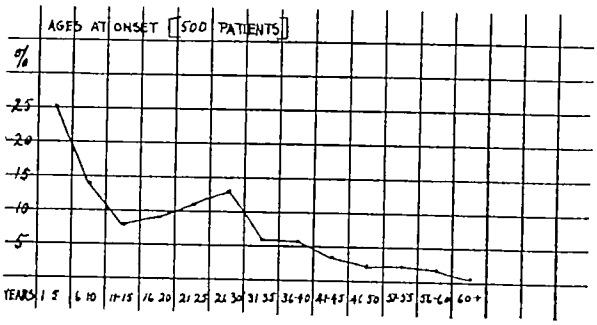

CHART 1
Ages of Onset by years, showing the percentages in each year group

Chart No 1 shows the ages of onset of asthmatic symptoms in the group of patients who had their first asthma in childhood It presents the percentage of patients in each year group Eleven percent had their first asthmatic attack in the first year of life The peak occurs in the third year with 15 3% From this point there is a steady decrease in the yearly incidence until the twelfth year, with a slight rise thereafter

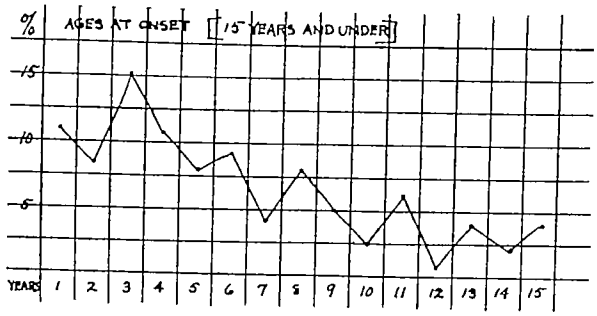

CHART 2
Ages of Onset by five year groups, with the percentages in each

For comparison, a chart, showing the age of onset of the whole group of five hundred patients is presented This is arranged by five year groups, with the percentages in each It will be noted that the number in the first five year group is double that in any other similar period In this group of five-hundred patients, one-quarter had their first asthma within the first five years The slight rise in later childhood is continued, and reaches its height in the latter half of the third decade However, this peak between twenty-six and thirty is only one-half (13%) that of the first five years (25%)

These patients were all tested for hypersensitiveness by means of the scratch test. Commercially prepared proteins were used From forty to eighty tests were made on each patient No test (with certain exceptions which will be described presently) was considered positive unless it presented a wheal distinctly larger than the control, usually with one or more pseudopods extending from the periphery of the wheal, and the whole surrounded by an erythematous area. The tests were read after one-half hour One hundred eighty-five, or 80% of the two hundred thirty-five patients who had their first asthma in childhood, presented positive skin reactions with one or more types of substances, whereas one hundred fifty-nine, or only 60% of the two hundred sixty-five patients who had the onset after the age of fifteen, gave such reactions.

These figures may be subject to criticism, because, included in the positive results, are some reactions with bacterial proteins which do not conform to the ordinary type of skin reactions, and about which there is some controversy I have considered as positive two types of reaction with the bacterial proteins first, that which resembles the reaction described above, presenting a wheal with pseudopods and surrounded by an area of erythema. These have been rare, only two occurring in the whole group of five hundred patients Secondly, the type in which there is no reaction at the end of one-half hour, but which presents a definite area of erythema, one-half to two cm , in diameter about the site of the scratch at the end of twenty-four hours This is not raised above the level of the surrounding skin. Often the scratch itself contains some sterile pus

I am convinced that such reactions are of significance because, (1) patients who present them often show striking improvement when treated with vaccine containing the organisms giving the reaction, such improvement occurring after all other methods had failed, (2) in a few cases extremely small doses of the appropriate vaccines have produced striking local reactions about the sites of the injections, resembling the local reaction produced by a moderate over-dose of pollen extract, and (3) in two cases so treated, mild asthmatic attacks followed within a few minutes after the administration of the vaccine, in the same way that asthma may be induced by fairly large overdoses of pollen extract

If these reactions with the bacterial proteins, about which there may be some doubt, are subtracted from the total number, 68% of the two hundred and thirty-five patients who had the onset in childhood presented positive reactions, as compared with 54 4% of the two hundred and sixty-five patients who had their

first symptoms after the age of fifteen

The demonstration of one or more positive skin reactions does not mean, of course, that nothing else about the patient must be considered in bringing about relief It does, however, present a means of making a specific diagnosis, and, when considered in connection with all other factors, offers a definite specific method for the treatment of this distressing condition

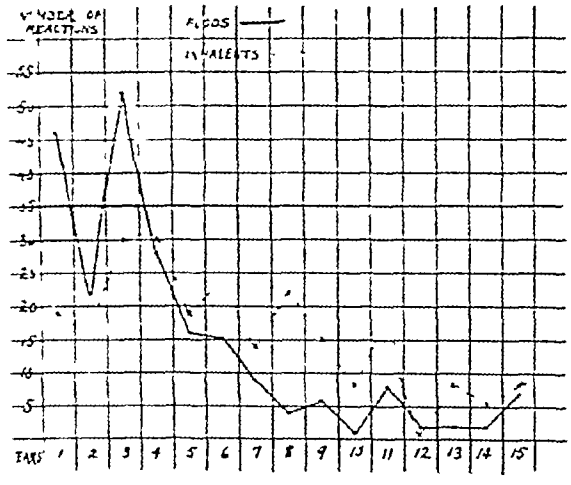

CHART 4

Number of reactions with Foods and Inhalants by one year groups, the years representing ages of Onset

Chart No 4 shows the number of reactions which occurred in these one hundred and eighty-eight patients by years, the years representing the ages of onset of asthma The curve for the food reactions parallels the percentage curve for the age of onset for the first three years, with a high peak (45) in the first year, a moderate fall in the second year and the highest peak (52) of all in the third year Thereafter the fall is very rapid, and only a small number of these patients who began to have asthma in later childhood present evidence of food hyper-sensitiveness The curve for the inhalants starts at half the height (19) of the food curve, and reaches its peak (30) in

the third and fourth years, and then falls more gradually, but remains consistently higher throughout later childhood

Stuart and Farnham (2) have made a study of the comparative frequency of food and inhalant sensitization Their curve for the cases of food hyper-sensitiveness parallels closely the one shown here However, they found very few positive reactions with the inhalants in the first two years, with a rapid rise for the next three or four years It may be that the curve that I am presenting would more nearly resemble theirs for the inhalants if all my patients had been tested at as early ages as were theirs, because at the time these tests were made, several patients reacted to both the foods and inhalants Nevertheless, I am sure the high point in the curve for this group would remain in the very early years, because so many children, tested in the first four years of life, have reacted to these substances

The fact that the high points in these curves occur so early, suggests that the first exposures of these hyper-sensitive children to these substances caused symptoms It would seem wise, therefore, to add with great care, new food substances to the diet of children from families in which there is a history of hyper-sensitiveness This applies especially to such substances as egg, wheat and peanuts, the latter so frequently used in the form of peanut butter Care should also be exercised in the exposure of these children to the epidermals in mattresses or pillows, or to pet animals, such as cats and dogs

Treatment These patients were treated during the acute attacks of asthma by having them inhale the smoke from some one of the various asthma powders, by the subcutaneous injection of Adrenalin, or by the oral administration of Ephedrin Occasionally morphine was necessary It is worthy of emphasis that children often require doses of Adrenalin which are relatively much larger than would be necessary for adults, that is, a child of one, or two years of age, may need fully two-thirds of the usual adult dose before he gets relief

The treatment between the attacks consisted of the usual hygienic measures to promote the general health of the individual An attempt was made to clear up any foci of infection, to assure proper function of the digestive tract etc

EGG FREE DIET

Things Which May Be Eaten

BEVERAGES	Milk, cocoa, chocolate flavored malted milk.
CEREALS	Well cooked cereals, oatmeal, wheatena, hominy grits, farina Prepared cereals served with plenty of milk or cream
BREAD	Whole wheat, white, graham, zwieback, crackers
FRUITS	Apple sauce, baked apple, stewed prunes or peaches, baked banana.
RAW FRUITS	Peaches, apple, oranges, figs, dates, raisins
VEGETABLES	Baked, plain boiled or mashed potatoes, spinach peas carrots, asparagus.
SOUPS	Made with milk and vegetable juice or pulp
DESSERTS	Junket, rice, tapioca or other cereal puddings prepared *without eggs* Lemon or orange sherbet, cocoa or junket ice cream.

DO NOT EAT ANYTHING WHICH CONTAINS EGG IN EVEN THE SMALLEST AMOUNT

Things Which Must Not Be Eaten

Avoid

Hot bread (muffins, popovers)
Cream sauce made with egg
Meat loaf, croquettes
Mayonnaise or cooked salad dressings
Cake, cookies, cream pie.
Custards, tapioca, fruit whips
Ice cream, unless made *without* eggs

The specific treatment varied somewhat as the causitive factors varied When an individual gave a positive skin reaction with one or more foods, these foods were removed from his diet. When the offending food happened to be one of the basic food-stuffs, such as egg, wheat or milk, which are used in so many forms, I have found it very helpful to have a diet sheet, presenting some suggestions as to foods which may be eaten with safety, and others which must be avoided After a prolonged period of abstinence, foods of this kind were added to the diet in extremely small amounts, and very slowly increased, to build up the patient's tolerance The less commonly used foods, such as cocoanut, etc, have been eliminated entirely

If the patient reacted to the epidermal proteins, the offending material was removed from his surroundings whenever possible When this could not be done, he was treated by subcutaneous injections of an extract of the substance

In cases presenting reactions with the bacterial substances, either autogenous or stock vaccines, containing the organisms which gave the reactions, were used In these cases, especially, foci of infection were sought for and removed whenever present

Orris powder was removed from contact with the patient by having her use cosmetic preparations which do not contain this substance An effort to make sure that other members of the family do not use harmful preparations is also necessary in these cases

Patients hyper-sensitive to pollens, were advised to spend the pollen season in some locality in which the pollen content of the air is at a minimum When this was impossible

they were treated in the usual way with the pollen extract.

I have compared the results in the patients with the onset at fifteen and under, with those whose first asthma began after that age By the term *well,* I mean free from asthmatic symptoms. *Much Improved* means relieved from two-thirds or more of their symptoms *Improved* means that occasional asthmatic attacks still occur, but the frequency and severity are reduced The other terms explain themselves

TABLE OF RESULTS

	235		265
Well	25—10.5%	Well	15— 5 6%
Much Improved	134—57 1%	Much Improved	141—52.8%
Improved	31—13 1%	Improved	36—13 5%
Unimproved	44—19 1%	Unimproved	70—26 4%
Died	1— 04%	Died	3— 1 1%

Of the group starting in childhood, slightly more than two-thirds (67 6%) gave very satisfactory results as compared with 58 4% of the older group Those showing slight to moderate improvement were almost identical Failures occurred in one-fifth (19 1%) of the younger group, and in one-quarter (26 4%) of the older group

When the results are analyzed from the viewpoint of positive or negative skin reactions, it will be seen that results in cases in which a specific diagnosis is possible are much better than when no positive skin reactions occur More than four-fifths of the patients presenting positive skin reactions gave very satisfactory results as against 13% of the non-reactors, while failures occurred in only 10% of those presenting positive reactions and in 53% of the non-reactors

Positive Skin Reactions		Negative Skin Reactions	
Well	13 %	Well	2 1%
Much Improved	69 %	Much Improved	10 6%
Improved	8.5%	Improved	32 %
Unimproved	10 %	Unimproved	53 %
Died	None	Died	2 %

SUMMARY

1 The records of two hundred thirty-five patients who had their first asthma at fifteen years and under, are compared with the records of two hundred sixty-five patients whose first asthma occurred after the age of fifteen years.

2 Both groups are equally divided between the sexes.

3 In the younger group, there is a family history of atopy in 50 7 per cent. In the older group, 28 per cent

4 10 6 per cent of the younger group had antecedent eczema, and of the older group, 08 per cent.

5 41 per cent of the younger group had had asthma for ten or more years, and 12 per cent for more than thirty years

6 There is no special peculiarity as to race.

7 The acute infectious diseases rarely precipitate asthma.

8 The so-called "colds" which initiate asthmatic attacks are usually cases of allergic coryza.

9 Pulmonary tuberculosis was infrequent in this group

10 Definite paranasal sinusitis was found in only 13 of the group of two hundred thirty-five.

11 In the whole group of five hundred patients a larger number had their first asthmatic attack in the first five years of life than in any other similar period.

Of the group with the onset at fifteen years and under the peaks of this curve of onset occur in the third and first years

12. 80 per cent of the group of two hundred thirty-five presented positive skin reactions.

60 per cent of the group of two hundred sixty-five presented positive skin reactions

13 Positive reactions with the food proteins comprised 50 per cent of the total, the remainder being composed of inhaled substances.

14 The peaks of the curves for both food and inhalant reactors occurred in the early years, for the foods, in the first and third years, and for the inhalants, in the third and fourth years

15 The results were better with patients whose asthma started in childhood than with those who had the onset in adult life.

16 Deaths do occur during asthmatic attacks, altho they are rare.

17 The results were distinctly better in those patients in whom it was possible to make a specific diagnosis, by means of the skin test, than in the non-reactors

Next Annual Meeting in Utica, June 3-6, 1929

For list of officers of County Medical Societies, see April 15 issue, advertising page xxxii

PREPARATIONS FOR THE ANNUAL MEETING

The annual meeting of the Medical Society of the State of New York has three great features, the scientific, the administrative, and the social The last issue of this Journal announced the program of the two-day scientific sessions This issue contains the annual reports of the officers and committees, on whose basis the House of Delegates will form the administrative policy of the Society

There are also social features which will make the annual meeting interesting not only to the doctors, but also to their wives All who come to Utica will be interested in a description of the Historic Mohawk Valley which will be a special feature of the next issue of this Journal Doctors are urged to come to the meeting prepared to visit the numerous historic places in the vicinity of Utica

THE MEDICAL YEAR

When one reads the annual reports of a state medical society, such as are printed on page 505 of this JOURNAL, the questions arise, "Have its accomplishments kept pace with the ideals of last year? Are the items of work ephemeral or permanent in character? What is the effect of the activities of the state officers and committeemen on the practice of medicine by the physicians of the state?"

Annual reports are the result of the application of certain tangible yardsticks of measurement, such as the number of meetings held, the kind of activities promoted and the amount of money expended There are also certain intangible yardsticks whose measurements cannot be expressed in cold words and figures The average physician wishes to know wherein the Society touches him personally, to inspire him, and to interest him in the discharge of his professional duties His opinion is reflected in such tangible ways as the growth in membership of the medical society, and the respect with which his profession is held by the people and by governmental officials

The editor of a medical journal performs a dual duty In the first place he is a recorder and historian who fixes facts on a printed page as a phonograph records sound He must stick to facts and be sure that what he prints are really facts and not imaginations

In the second place an editor is an interpreter of facts, and a judge of their permanent value As a historian the editor deals principally with the past, and the nearer he gets to the present, the more uncertain is he of the permanent value of the facts which he records Yet every plan and aspiration announced in the annual reports has a value Anyone listening at a conference of medical men will be struck with the diversity of opinions that are expressed The timid officer will delay his own decision until the opinion becomes unanimous The over-active officer may hasten the application of his plans in the face of determined opposition But to try out a plan is far better than to condemn it on theoretical grounds Every good plan has some elements of undesirability, be they no more than the efforts required to put them into operation In fact, the way of all medical progress is as steep and thorny as that which leads to a moral and religious heaven Records of ineffective plans have the value of signboard warnings of the impassability of those routes It may be, too, that the value or uselessness of a measure may not be apparent for several years

The annual reports of officers and committeemen are filled with projects which have died aborning One reading the reports of twenty-five, or even five years ago will be discouraged or inspired largely according to his temperament He will be discouraged if he dwells on the failures of the plans, and he will be inspired if he traces the story of one or two successes amid the tangle of ineffective propositions A physician will be enthused when he realizes that the flame of medical progress which he is now feeding, began as a spark that was lighted years ago, and, has had sufficient vitality to remain alive until he assisted in fanning it into life and feeding it with the fuel supplied by modern resources

Pessimistic readers fail to take into account the new conditions of education and discovery, and the optimistic spirit which they bring They also fail to evaluate the willingness of physicians to put forth effort and money in the altruistic work of advancing the cause of scientific medicine There is a great reservoir of this spirit ready to be tapped by the medical prophets in societies and research laboratories

Any one reading the journals of the state societies will be struck with the universality and similarity of medical problems in all the states Nearly every month some state journal contains reports similar to those which are printed on page 505 of this JOURNAL The legislative problems of the several states, for example, are like those in New York State, and the arguments which fill the sections of the journals are exactly those which filled the pages of the *New York State Journal of Medicine* during the years 1924 and '25 when the Medical Practice Act was in process of enactment Several states are discussing the annual registration of physicians and warning the profession of its perils—which have not developed after three years of the operation of the law in New York State

Is the Medical Society of the State of New York making progress? The report of any one year may be insufficient to demonstrate the fact, for progress is indicated by a comparison of the reports of several years The report of this year gives the position of the Society on May first, 1929, but the position of the Society in 1928 and 1927 must be shown in order to determine the progress that has been made How many physicians take the trouble to ascertain the attitude of the State Medical Society five years ago toward such medical topics as the civic duties of medical societies, the anti-diphtheria campaign, courses of graduate education, and the correction of abuses of the Workmen's Compensation law? Only those who read the annual reports of former years can appreciate the immense progress made by the Medical Society of the State of New York

What is the present position of the New York State Society on the map of medical progress? While New York State has been the pioneer in sending forth many new ideas, yet it has not had a monopoly of the production of new projects Michigan, for example, is far ahead of New York in the organization for the education of the people in public health, and some societies of Ohio and New Jersey have been pioneers in medical

items in newspapers New York has not taken at all to the idea of Women's Auxiliaries Yet if all the state medical societies were scored by a system like that applied to the public health activities of cities, New York State would probably show the highest score

OUR ADVERTISING COLUMNS

Why do medical journals devote over one-third of their space to advertisements? Some doctors say they seldom look at the advertising pages This is especially true of New York doctors Advertisers recognize this fact, and say that the physicians of the Western States actually read the advertising pages of their journals Are the doctors of the East less commercially minded than those of the Western States? But the question is not sectional No doctors anywhere will show an eagerness to turn to the advertising department unless its pages carry messages which are new, informative, and appealing

An example of an appealing advertisement is that used in the last issue of this Journal by a pharmaceutical house It consists of a full page announcement entitled "A boy's Idealism and its Result" It carries a picture of the Good Samaritan, and tells the reason why the founder of the house took up the study of pharmacy That advertisement will attract the interest of doctors far better than a formal list of the products of the house would do

Another advertisement is the announcement of a well-known maker of preparations of digitales who based his advertisement on the "Cat units" described on page 485 of the Department of Medical Wares of the same journal

Advertisements written in the style of the two just described would entice the doctors of New York State to scan the advertising pages of the Journal as eagerly as they do those of the scientific department

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

State Society Journals—Twenty-five years ago when the two State Medical Societies were in process of consolidation the question arose whether the amalgamated society should continue the monthly journal started by the Association in 1901, or should publish annual volumes of Transactions as had been done by the Society for nearly one hundred years This JOURNAL of May, 1904, quotes the *California State Journal of Medicine* as discussing the situation in New York and says

"The Society has published its transactions for nearly a hundred years, and this seems to be the principal argument for continuing to do so, and ceasing to publish the journal It is also claimed that copies of a journal become lost or destroyed and then members have not a complete record The further question of greater expense is about the only other argument adduced to support the plea for discontinuing the journal, when the Society shall have absorbed the Association How puerile these arguments seem, when compared with the reasons for a State Society publishing a journal! It is reasonably safe to say that the New York Association could not have attained nearly the size, and the influence which it has secured, without its journal It is also safe and conservative to prophesy that the profession in that State will not be well or fully organized if the journal is discontinued Twelve messages a year to each member are worth a whole lot more than one, more than twelve times as much as one delayed volume of 'Transactions' which nobody thinks of reading"

Time has justified the arguments for the publication of a journal, as will be seen by reference to page 513 on which the JOURNAL is discussed in the annual report of the Executive Committee of the Council

MEDICAL PROGRESS

Sympathectomy for the Relief of Angina Pectoris.—Edward P Richardson and Paul D White, writing in the *American Journal of the Medical Sciences*, February, 1929, clxxvii, 2, compare the results of sympathectomy with those from paravertebral alcohol injection for the relief of angina pectoris, and raise the question whether these methods of treatment constitute good therapeusis In 11 operations performed on 8 patients with angina pectoris, from August, 1923, to December, 1926, the extent of the sympathectomy was varied There were two deaths in the series Lasting benefit followed the operation in 4 cases In only one case out of 5 did satisfactory relief follow the removal of the left superior cervical ganglion alone, although another patient was considerably improved On the whole these results were not considered very encouraging, and the advisability of a more extensive removal of the sympathetic connections to the heart as a primary procedure was being considered It was then decided to try the paravertebral injection of alcohol as advocated by Swetlow In 8 patients treated by this method symptomatic relief was more constantly obtained than in those treated by sympathectomy While there has been a tendency for pain to recur in one or two cases, the relief has generally lasted as long as the patients have been followed—up to eighteen months in one case Paravertebral injection is, in the authors' opinion, a safer procedure than sympathectomy, though there is a possibility of injury to the spinal cord by diffusion or misplaced injection Alcohol injection of the five left upper thoracic nerve-roots is justifiable in carefully selected patients who do not respond to other forms of treatment There is no other contraindication The injections may be made even after coronary thrombosis, and doubtless are much less of a risk than is cervical sympatheetomy It has been argued that the relief of pain or interruption of the nervous mechanism of the heart exerts a harmful effect on the disease, because it does away with a warning symptom useful to the patient This may be possible, but it has not been proved No lasting ill-effects have followed paravertebral injection

Treatment of Pneumonia in the Negro With Antidiphtheritic and Antivenomous Sera.—J Legendre and L Phiquepal d' Arusmond mentioned the murderous mortality of pneumonia among the black races, which obtains in certain portions of Africa the year around Nearly everything in the way of treatment has been tested. With antipneumococcus serum in a small material the mortality was 50 per cent and the old classical treatment plus electrargol is the only one which gave slightly better figures Some nonspecific sera were then tested In 15 patients treated with antidiphtheritic serum and 10 others treated with the snake-bite serum the combined mortality was but 3 cases, equal to twelve per cent More recently one of the authors (Phiquepal d'Arusmond) has treated 6 cases with the snake-bite serum with but one death The total treated by heteroserotherapy is thus far 31 with a mortality of four cases or about 13 per cent—a result far superior to that obtained by homoserotherapy with its mortality of 50 per cent Moreover the doses used were very much smaller, given intravenously These results are of course paradoxical, for symptomatic treatment shows itself far superior to specific treatment. The entire question of serum therapy seems to require overhauling Thus in these African cases there was no bacteriological examination and it might even be claimed that the bacillus of diphtheria was actually present in these patients, but this is far from likely, for the disease diphtheria is believed to be quite unknown among the negroes and resident whites as well The negroes had never left their native soil and a theory of latent diphtheria could not be maintained Even if there were some such explanation available in the cases treated by antitoxin there is no similar argument to account for the cures from snake-bite serum We therefore have to fall back on the usual hypothesis of protein shock, in which the active factors were the basic horse serum and the proteins of the antibodies formed by the two antigens.—*Bulletin de l'Academie de Medecine*, January 29, 1929

An Early Symptom of Tuberculous Meningitis.—K Ochsenius dwells on the importance of the recognition of early symptoms in general, which can hardly be taught by others but must be learned by personal experience at the bedside In many affections the outcome is due entirely to the presence or absence of this early diagnosis—notably if we have to depend on serum therapy In many affections, and particularly in tuberculous meningitis, the early clinical picture exhibits the greatest variety The author refers to a case in a child of 5, as yet without an actual disease process but sickly with a positive diagnostic tuberculin reaction, in whom tuberculous meningitis developed later, despite the statement of a well known clinician that there was nothing to worry over Repeated vomiting in a young child should awaken suspicions in the absence of an evident cause In one of the author's patients, aged 4½, but very tall for this age and considerably under-

weight, vomiting was occurring at about the same time every day A rontgenogram of the stomach showed nothing wrong while conditions pointed to a psychogenic factor Blood sedimentation and lumbar puncture had not been practised The child suddenly developed fatal tuberculous meningitis For the past 12 years the author's attention has been directed to another early symptom, namely an inability of the child to speak at will, the speech showing a sort of dysarthria with inversion of syllables or irrationality This may be transitory, it is far from constant, and present only in a minority In such cases rigidity of the neck, etc, might coexist and the Pirquet reaction be strongly positive Recent trauma of the cranium may be elicited in the history Judging from the examples of speech defect cited, this symptom may show the greatest variety—simple aphasia, various forms of dysarthria, and simple irrational sentences —*Deutsche medizinische Wochenschrift,* February 8, 1929

Uremia in Cases of Amyloid Kidney—E Zadek says that our knowledge of this subject is defective, decisive case reports being rare Autopsies may show that death has been due to intercurrent affections, even when there has been nitrogen retention The author has gone over all possible cases of the association of amyloidosis with uremia at Umber's medical clinic at the Charlottenburg Hospital, Berlin, since 1913 and found 15 cases of the type worth investigating The diagnosis included amyloid kidney and autopsies were obtained in all cases In only five was death surely due to uremia, but in 2 others dead of intercurrent disease there was defective concentration and nitrogen retention In the remaining 8 cases there was no evidence whatever of renal insufficiency This result agrees fairly well with those published some 13 years ago by Machwitz and Rosenberg Full histories are given of four cases of true uremia The first patient suffered from uncomplicated amyloid contracted kidneys but also presented an uncompensated mitral lesion which was accused of having been the primary factor in the disturbance of water excretion The second patient had a pure nephrosis with heart normal Death had been due to suddenly developing acidotic uremic coma, the result apparently of thrombosis of the renal veins on both sides The third case resembled the second in representing a pure nephrosis, with heart and blood pressure normal There is no mention of any determining factor like venous thrombosis Edema was absent throughout The fourth patient, unlike the two preceding, presented arteriosclerosis and high blood pressure Urinary and blood analyses showed that uremic death can occur in these patients while the excretory function of the kidneys is still intact In three cases complications played a role—decompensated heart, renal vein thrombosis, and probably arteriosclerosis, but the third patient showed no complication of any sort—*Klinische Wochenschrift,* February 5, 1929

Pulmonary Tuberculosis and Rontgenology—H Cramer of Berlin refers to the cumulative occurrence of diagnostic errors, both of omission and commission He cites in detail two cases The first patient came from the Nose and Throat Clinic with a request for diagnosis for or against pulmonary tubercle, the motive being suspicion of tubercle of the larynx. There were no clinical evidences pointing to this involvement of the lung and the laboratory finds had been negative too The röntgenogram of the lung was equivocal, but on the whole was interpreted negatively The patient went back to the throat clinic, but as the condition in his larynx seemed to progress, he was returned for the second time to the internal clinic, and the author to this surprise found on this occasion a well marked apical involvement, evidently bilateral At this period it would have been easy to diagnosticate the lesions without plates Apparently it is never wise to remain content with a single exposure and if this case had been followed up there need have been no conflict between two exposures The second patient came from Africa with plates of his lungs bearing in three languages the diagnosis of tuberculosis He suffered clinically from an intermittent fever which had therefore been regarded as tuberculosis The author when shown these films subjected them to tests and found no active lesions—nothing beyond a cicatrized and calcified condition of the regional lymphnodes, the lung fields being quite clear These two errors of diagnosis serve as types of what to expect in this field of endeavor, although they do not exhaust the subject—*Münchener medizinische Wochenschrift,* January 25, 1929

The Cause and Cure of Morning Sickness—While treating a pregnant patient for a vaginal condition for which he used, among other things, a tampon of glycerin and borax, Andrew Richmond found that she was entirely relieved of morning sickness In investigating the matter he concluded that the cure was due to the glycerin and borax tampons Since that time he has made it a constant practice to treat cases of morning sickness by this means, and has never had a failure In reading up the subject he found that successful cures had followed opening of the cervical canal In watching his cases he observed that the vulva and vagina were turgid, swollen, and discolored, and the cervical canal was also swollen and choked with secretions After the use of the tampons, the turgor and swelling subsided, there was the greatest improvement in the cervix, and the cervical canal became practically normal The reason choking and closure of the cervical canal cause nausea can be easily under-

stood by comparing it to other choked ducts such as the bile duct, or obstruction in strangulated hernia The technique of applying the tampon is as follows A piece of Gamgee tissue 2 by 4 inches is rolled up and tied with a length of soft crochet thread, two ends of the thread, about 8 or 10 inches long, are left, so that the patient may remove the pad herself The tampon impregnated with the glycerin-borax solution is then inserted in the pouch of Douglas, extending at least as far as the vault, and lying in contact with the cervix The pad is removed after being in position for two days, and another pad can be inserted Two pads are usually quite sufficient, only on two occasions has the writer found it necessary to use four In hyperemesis gravidarum four tampons may be required—*British Medical Journal*, February 23, 1929, 1, 3555

Fatal Case of Stokes-Adams Syndrome—E Geraudel, P L Brodin, and J Lereboullet report in great detail a case of fatal heart block in a woman of 72 The authors' own summary is as follows The case was a classical one of auriculo-ventricular dissociation with permanent bradycardia (ventricular bradyrhythmia), the artery of the ventriculonector having been found to be interrupted materially through its entire extent If the ventricle continued to beat after all excitation had ceased it was because of its automatism The tracings showed normal ventricular complexes save when a disturbance was produced during a crisis of extrasystoles, the identification being difficult The authors are unable to understand how with a block of both branches of the bundle of His the ventricular complex could remain normal—that is, if the classical theory is correct. One must admit that each branch above the section was the focus of origin of a stimulus and that the right and left stimuli reached the ventricles without any deformity of the ventricular complex through preponderance of either the dextrogram or the levogram. This might happen once in a while and occasion no surprise, but it is very unlikely that the phenomenon could be repeated with each beat of the heart But the persistence of the normal complex is quite natural if we can believe that the automatic contraction takes its origin in the ordinary myocardium and not in the specific myocardium The interruption of the ventriculonector was due in this patient to a transverse focus of necrosis, due in turn to a stenozing endarteritis of the artery of the ventriculonector It has also been shown that the same result (heart-block) may take place without a necrosis, due simply to functional arterial stenosis Arterial lesions then play an overwhelming role in the genesis of the Stokes-Adams syndrome and epecially should the latter be frequent in the aged with coronary lesions—*Archives des maladies du coeur*, January, 1929

Cause of Death in the Newborn.—W Klimke takes up this subject with particular reference to a recent article by Hook on the results of autopsies on newborn infants in which special attention was given to changes in the brain and lungs This author found that intracranial hemorrhage was not due necessarily to birth trauma. He even found this accident in undelivered dead fetuses when the os uteri was closed Hence to count a hemorrhage as traumatic there must be evidence of an external trauma Aspiration pneumonia was very common as an accident of delivery Following Hook and other writers on the subject, the author analyzes his personal statistics covering 1,111 autopsies on the newborn during the past 15 years Difficult labor accounted for not more than 20 per cent In 6 per cent survival would have been impossible, because of malformation Another 20 per cent set down to "infantile complications" comprised a variety of accidents but aspiration pneumonia seems to have played a small role In a few cases the pneumonia was clearly prenatal Congenital syphilis as a cause of death seems to have receded greatly in recent years until it hardly figures in the current mortalities Something over 20 per cent of all cases were set down to marasmus, and another fraction of about the same size was simply ascribed to "causes unknown" It seems obvious that little or no advance in our knowledge of the causes and mechanism of death in the newborn has accrued in the past quarter century It is one thing to find an alteration and quite another to make it responsible for death, thus aspiration of amniotic or other fluid into the lungs may or may not set up a reaction, and in the absence of such, one is hardly justified in speaking of death from aspiration—*Klinische Wochenschrift*, February 19, 1929

Treatment of Elbow and Ankle Sprain.—Frank Thomas Woodbury reports the case of a professional dancer who injured her ankle, so that she was unable to bear her weight upon that foot There was a sprain of the external lateral ligament with some contusion of the joint, considerable swelling and much tenderness Diathermy was given for thirty minutes from an electrode beneath the sole of the foot to a cuff electrode above the joint, maintaining a current volume to the heat tolerance of the patient. This was followed by forty minutes of the surging positive electrostatic charge (wave current) An electrode of florist's lead foil was wrapped about the entire joint and the spark gap was opened to tolerance, being increased as the treatment proceeded The following day the same procedure was repeated in the morning and the afternoon No further treatment was required. The patient was instructed not to rest the ankle but to return at once to her dancing practice. Seventeen days after the ankle treatment the patient gave her

right elbow a severe twist while dancing The elbow was greatly swollen, was being supported at an angle of less than 45 degrees, and any effort to extend the forearm was resisted The treatment employed for the ankle sprain was applied, and repeated daily for seven days, with the result that the elbow became absolutely normal The special feature of the treatment of sprains is to remove exudates and to forbid all attempts to rest or immobilize the part, as this is certain to result in more or less limitation of motion The method here described may be employed in conjunction with fracture after the fragments have been immobilized —*Physical Therapeutics*, February, 1929, xlvii, 2

A Departure from the Usual Methods in Treating Obesity —Frank A Evans and James M Strang emphasize the importance of metabolic orientation in the treatment of the obese In these persons a diminished specific dynamic action of protein and also some abnormality of fat metabolism by which it becomes available for storage has been postulated If these disorders of metabolism in the obese do exist they are, possibly, dependent upon an endocrine cause, but this cannot be treated by any rational endocrine therapy No special article of food has any merit for the reduction of weight Total calories must be reduced The authors have found that "endocrine obesity," as well as that of alimentary type, can be effectively treated on a diet as low as 600 calories a day, and that the result is in sharp contrast to the irritability and cachexia seen with more generous diets not carefully planned on metabolic principles The method used has been to calculate the correct diet for the ideal weight or whatever weight is desired With a gram of protein per kilogram, enough carbohydrate and fat was calculated to give 25 calories per kilogram, the antiketogenic ratio of carbohydrate to fat being 1½ to 1 The menu was made to fit the figures for protein and carbohydrate, and then as much of the fat was omitted as could be, while the patient was receiving the desired amount of protein A sample menu consisted of the following *Breakfast* 1 egg, 1 ounce of bread toasted *Lunch* 1 egg, 4 ounces of vegetables as listed *Dinner* 1 cup of bouillon (if desired), 3 ounces of lean meat (after cooking), 4 ounces of vegetables Accepted vegetables include lettuce, cucumbers, spinach, asparagus, endive, celery, mushrooms, tomatoes, brussels sprouts, watercress, cauliflower, radishes, cabbage, and onions (sparingly) The bread is toasted No fried foods are allowed, and no butter or lard is used in cooking Water may be taken as desired It is just as important that all this be eaten as that nothing not on the list be taken. A level teaspoonful of soda in a half a glass of water is taken twice daily In a series of 111 patients dieted on this plan, there was an average loss of 6 14 pounds per patient by the end of the first week These patients were not hungry Headaches were relieved and elevated blood pressures were reduced As the diet was continued other symptoms, especially menstrual disorders, were corrected A tuberculous lesion is undoubtedly a contraindication to the treatment, but patients with minor grades of myocardial damage bore it well— *American Journal of the Medical Sciences*, March, 1929, clxxvii, 3

Extract of Liver in the Treatment of Hypertension —T L Althausen, W J Kerr, and T C Burnett, writing in the *American Journal of the Medical Sciences*, March, 1929, clxxvii, 3, point to the fact that life insurance statistics demonstrate the importance of hypertension in connection with high mortality due to cardiovascular-renal disease The symptomatic treatment of hypertension in the present state of our knowledge is justified The work of a number of investigators shows that liver extract is capable of lowering blood pressure, though the active ingredient of the extract responsible for its depressor effect and its mode of action are unknown The authors treated 27 cases of hypertension with intramuscular injections of a commercial liver extract with the result that an average reduction of 32 7 mm in the systolic blood pressure took place in 63 per cent of all cases Lowering of the diastolic pressure was generally in proportion to that of the systolic, and averaged 18 9 mm Symptomatic relief was experienced in 76 per cent of all cases However, reduction of hypertension and symptomatic relief did not always go together Age, sex, and the degree of hypertension proved to be immaterial in determining the success of liver extract therapy The duration of hypertension prior to treatment was found to affect very markedly the result of therapy The urinary findings and the various kidney function tests were found to have unequal bearing on the success of the treatment Hypertension cases of known duration under two years, without marked arteriosclerosis, and showing no fixation of specific gravity in the Mosenthal test, offered the best prognosis The presence or amount of cardiac damage was of no significance, so far as the success of the treatment was concerned The dosage for the average case was, to start with, three injections a week, beginning with 0 5 c c , then 1 c c , and so on, until at the end of two weeks 5 c.c were reached By this time the value of the treatment in the individual case can usually be determined, and in the successful case injections can be given once a week for a month, and then discontinued until the pressure begins to go up or the patient complains of a return of symptoms In 8 successful cases the effect of the treatment extended over periods of between one month and two and a half months No undesirable symptoms referable to reduction of hypertension were observed in any case.

LEGAL

By LLOYD PAUL STRYKER, ESQ
Counsel Medical Society of the State of New York

INDIVIDUAL LIABILITY OF PHYSICIANS FOR ACTS COMMITTED IN HOSPITALS

From many inquiries received, as well as from statements made to us by a number of physicians, we believe that many doctors are laboring under a misapprehension as to their individual liability for acts in the treatment of patients in the hospitals with which they are connected These inquiries have, for the most part, been specifically directed to the question as to whether or not the policy of insurance carried by the hospital would protect the individual physician who might be sued in a case which he had treated in the said hospital

Some physicians have told us that they have been informed by the hospital authorities that it is not necessary for them to carry individual insurance covering the cases which they treat in the hospital This is not the fact, and we believe that the profession generally should be informed as to the legal relationship existing between them and the hospitals to which they are attached and in which they operate upon and treat patients

Let us assume a typical case A, while in the X hospital (which carries a policy of insurance indemnifying it for the acts of physicians on its staff), is operated upon by B, an attending physician at said hospital A thereafter sues both the hospital and the physician, claiming negligence in the performance of the operation The hospital is covered by a policy of insurance, but the doctor is not On the trial of the action the plaintiff's complaint is dismissed as to the hospital, but a verdict in favor of the plaintiff is found against the physician. In such a case, the policy of insurance covering the hospital does not protect the individual physician, and the amount of the verdict would have to be met personally by the physician This would be so whether the case was a private case of the physician, or a ward case where the physician had received no compensation. The responsibility of a physician to his patient is exactly the same whether the physician is paid or not

In our typical case, we have assumed that when the case came to trial, it was dismissed against the defendant hospital This is a fair assumption since, except for private hospitals or sanitariums operated for profit, other hospitals, commonly known as charitable, not-for-profit hospitals, are not liable for the acts of their physicians, except for a failure to use due care in the selection of the individual physician who it is claimed caused the injury which forms the subject-matter of the action Your counsel has frequently defended actions where a charitable hospital and the individual physician were joined as parties defendant, and in every such case the complaint against the hospital was dismissed for the reason that the plaintiff was not able to offer any proof that the hospital had been negligent in the selection of the physician who treated the plaintiff

There is no relation of master and servant, or principal and agent, existing between a hospital and the resident or visiting physicians connected with the hospital The law regards the physicians as independent contractors, personally liable for their own wrongs In a leading case in the Court of Appeals of this State, in discussing this relationship it was said

"The hospital does not undertake to act through them (the physicians), but merely to procure them to act *upon their own responsibility* And so there is no such relation between the corporation (the hospital) and the physicians and surgeons who give their services at the hospital It is true the corporation has power to dismiss them, but it has this power not because they are its servants, but because of its control of the hospital where their services are rendered The wrong was not that of the hospital, it was that of physicians, who were not the defendant's servants, but were pursuing an independent calling, a profession sanctioned by a solemn oath, and safeguarded by stringent penalties If, in serving their patient, they violated her commands, the responsibility is not the defendant's (the hospital), it is theirs There is no distinction in that respect between the visiting and the resident physicians"

The standard policy of insurance covering hospitals indemnifies the hospitals against "actual loss or expense arising or resulting from claims upon the hospital for damages" This indemnifies the hospital against any tort for which it may be responsible, but does not indemnify or protect the physician whose diagnosis, care, treatment or operation is complained of

Even if we were to assume a case where a hospital and an individual physician were joined as parties defendant, and where the plaintiff were able to offer proof that the defendant hospital had in fact been negligent in the selection of the particular physician, and a verdict were rendered against both the hospital and the doctor, the policy of insurance covering the hospital would not cover the individual physician

As we have already said, the relationship between the hospital and the individual physician is not that of master and servant, or principal and agent, but the physician occupies the position with respect to the hospital of an independent contractor, personally liable for his own acts Physicians should recognize that while the hospital in which they work may be covered by a policy of insurance, the individual physician is not covered by that policy but remains personally liable

CLAIMED IMPROPER DIAGNOSIS AND NEGLIGENCE IN TREATMENT OF CHILD

In this case an action was brought by the mother of an infant child, about two years of age, claiming that she employed the defendant as a physician to treat a superficial rash on the child's buttock, and that the defendant negligently and unskillfully treated the rash and unnecessarily performed an operation thereon with the use of a knife, when the defendant knew or should have known that the operation was unnecessary, as a result of which the child was injured and erysipelas was caused to develop upon the child's buttock Damages were claimed in the infant's action in the sum of $10,000 and at the same time the mother began an action against the doctor for loss of services, praying for $2,500 damages

When the doctor was first called to see the infant plaintiff, she was in bed with a temperature of 103 The doctor made an examination of the child, but could find no objective symptoms of infection The doctor prescribed a fever mixture of aconite liquid ammonia and acetatis and water and ordered a cold sponge bath He called daily after this for about six days, and at this time the child was developing a swelling and tenderness on one thigh When the child's fever had subsided on the sixth day, he suggested that the child be brought to his office This was done and the doctor asked the mother if she would permit him to explore the seat of the soreness on the thigh The mother acquiesced in this course and the defendant, first sterilizing his instruments, under a cocaine local anaesthesia, made a small incision in the thigh, but found no pus He then bandaged the thigh with sterile dressings On that day after dressing the wound, he notified the mother that he was going out of town, but gave her the name of a competent physician who would take care of the case The mother consented to this course, but subsequently when the second physician attempted to see the child she refused to permit him to do so Subsequently the mother of the child called on the defendant, told him that the child had developed erysipelas and was being treated by another doctor She then demanded that the doctor pay her some money, which the doctor very properly refused to do, whereupon she began this action

As the case was coming on for trial, the plaintiff's attorney after fruitless negotiations to obtain a settlement, finally discontinued the action

REMOVAL OF FOREIGN BODY FROM EAR

In this case it was charged that the defendant doctor in the removal of a bead from the ear of a child about four years of age, so negligently and improperly conducted himself, particularly with respect to the instruments used in said operation, that the child developed a suppurative middle ear inflammation, and became deaf and cross-eyed

The child was brought to the doctor's office by the mother after the mother had first taken her to a hospital The mother gave the doctor a history that a bead had become lodged in the child's ear The doctor examined the ear and found a bruise on the lower third of the canal, blood was flowing from it and the doctor also found a small bead on the ear drum The doctor suggested that a general anaesthesia be given before he attempt to remove this bead The mother consented and she called the family physician who gave an ether anaesthesia The doctor then poured adrenalin into the ear and stopped the bleeding Then he reached into the ear with his forceps and lifted out the bead After the child came out of the ether he cleansed the ear with sterile dry gauze and the child was taken home She was brought back the next day and the doctor found that the ear was fairly clear, but still bleeding a little. He cleansed the ear with dry gauze on this occasion On the third day, when the child was brought to the office, the doctor found the condition of the ear about the same, except for a little discharge of blood and pus At this time he used sterile cotton and put in sterile gauze for a drain and advised syringing the ear with boric acid solution He told the mother to bring the child back, but she failed to do so and the doctor never saw the child again After the action was brought a physical examination of the child disclosed that she had measles a few months after the bead was extracted by the defendant and had developed otitis media

The case came on for trial and after the plaintiff had put in their case the court, on our motion, dismissed the complaint, thus terminating the action in the defendant's favor

NEWS NOTES

PUBLIC RELATIONS COUNTY SURVEY, No 5—ROCKLAND

Rockland is one of the smallest counties in the State of New York, when considered from the standpoint of its area It has a population of about 65,000 and less than 50 practicing physicians

The County Medical Society consisting of 47 active members and 22 honorary members is, as it should be, the guiding medical body from which emanate all lines of medical activities for the County and to which all medical interests are attracted The Society holds regular quarterly meetings, and prides itself not only on the conscientious attendance by its active members but also on the whole-hearted support at these meetings from its honorary members Three of the regular meetings consist of scientific and social sessions, while the fourth, the annual banquet, is devoted entirely to the development of good fellowship The scientific programs are arranged by the Comitia Minora early in the year

The Nyack Hospital located in Nyack is the largest and oldest hospital in the County, having been established in 1895 It has recently been enlarged by a $400,000 modern fireproof addition into an excellently equipped 75-bed hospital for the care of all acute diseases except contagious A special maternity pavilion, a separate operating pavilion, a completely equipped X-ray and electro-therapy department, a special dietetic department and a complete laboratory make up its integral units

The Good Samaritan Hospital in Suffern, established in 1902 and maintained by the Sisters of Charity, is a 35-bed hospital for all acute diseases except contagious

Summit Park Sanitorium in Pomona is maintained by the County This is a County tuberculosis hospital with 48 beds All county tuberculosis and anti-tuberculosis work centers in its Superintendent, Dr W J Ryan, who, with the cooperation of the County tuberculosis nurse, has built up and maintains a very effective service both for active case and follow-up case work

At West Haverstraw, the New York State Orthopedic Hospital for Children is maintained by the State with an active clinic available to the County

At Thiells is located Letchworth Village, which is a State institution for the feeble-minded

The Jewish Home for Convalescents in Grand View is a private sanitarium maintained by New York City organizations

At Congers is located a small cardiac clinic for children, a private charity, the children being sent out from New York City

In Nanuet is located a summer vacation home for crippled children, a charity maintained by private organizations The children are sent out from New York City

The State is now engaged in building a large hospital unit at Orangeburgh for the insane, but at this writing progress has not extended far enough to permit of its being occupied The State maintains a monthly mental clinic for the County, the clinics being held alternately in the hospitals at Nyack and Suffern

In addition to the above, there are various lay organizations that maintain either year-round or summer homes for children throughout the County These include the convents at Blauvelt, Sparkill, Nanuet and Spring Valley maintained by Catholic charities, the Christian Herald Home in Nyack, the Masonic summer camp for poor girls at Tallman, and the Gould Foundation for girls at Spring Valley and Pomona

The County Medical Society has advocated and sponsored anti-diphtheria campaigns, but has left the actual conduct of such work to the various individual health officers and health units As a result, toxin-antitoxin clinics have been held throughout the County and at this writing, clinics are again being held in Suffern, Spring Valley and Nyack

About ten public health nurses are employed throughout the County Most of these are school nurses, but they all adopt the role of community welfare workers and render most loyal support to the physicians throughout the County

Parent-Teacher Associations exist in all of the school districts These associations are frequently addressed by physicians and they have been most co-operative in a number of toxin-antitoxin campaigns and clinics that otherwise might not have been possible

The splendid spirit of good fellowship and fraternal co-operation maintained by the medical profession in Rockland County is largely responsible for the support given to the physicians and health officials by the lay organizations and the people in general

ALEXANDER N SELMAN, M D, *Chairman, Committee on Civic Policy, Rockland County Medical Society*

As we have already said, the relationship between the hospital and the individual physician is not that of master and servant, or principal and agent, but the physician occupies the position with respect to the hospital of an independent contractor, personally liable for his own acts Physicians should recognize that while the hospital in which they work may be covered by a policy of insurance, the individual physician is not covered by that policy but remains personally liable

CLAIMED IMPROPER DIAGNOSIS AND NEGLIGENCE IN TREATMENT OF CHILD

ALEXANDER N SELMAN, M D, *Chairman, Committee on Civic Policy, Rockland County Medical Society*

PUBLIC RELATIONS COUNTY SURVEY No 6—ORANGE

Orange County has a population of approximately one hundred and thirty thousand This population is divided roughly as truly rural fifty-five thousand, and urban as seventy-five thousand The rural population is being cared for by approximately thirty-five physicians while the urban population is cared for by ninety physicians

In this county we have one State Hospital for the Insane with a staff of sixteen physicians—the Middletown State Hospital for the Insane New York City maintains a Sanatorium for Tuberculosis at Otisville for the treatment of all forms of tuberculosis There are six general hospitals in the county situated at advantageous points so that no patient is more than twenty-five miles from adequate hospital service The total bed capacity of these general hospitals is three hundred and seventy-five beds These hospitals conduct out-patient departments as a part of their program A County Tuberculosis Sanatorium is maintained by the Board of Supervisors and, although far too small, its activities and usefulness are well demonstrated by the results shown in the reports of this institution The Board of Supervisors by their appropriations and active cooperation have aided greatly in maintaining the high standards of this hospital

The County Medical Society has a membership of one hundred and fourteen members The Society holds four meetings a year which are attended by approximately one half the members During the past two years the Society sponsored post graduate lectures, holding these at Middletown, Port Jervis, Goshen and Newburgh The County Society through its membership was responsible for instituting and assisting the Orange County Committee on Tuberculosis and Public Health in putting over a County wide anti-diphtheria program The Society is now working out a program of education to show the value of periodic health examinations, these examinations to be done by the physician himself, and not as a member of a group

In this county we have an active health organization, started in 1920 as the Orange County Committee on Tuberculosis and Public Health During the eight years from 1920 to 1928, this organization functioned admirably considering the funds at its disposal, but it was apparent that an incorporated organization was needed In 1928 the committee was incorporated as the Orange County Health Association with Dr B Krug as President, and a directorate of twenty-two members, of whom three were physicians The general membership of this Association numbers two hundred and eighty-two An executive Secretary and a nutritionist are employed as full time workers by this body The purposes of this body are

First, to utilize the resources of the Committee without profit to its members, in the discovery, control and prevention of tuberculosis, and the promotion of public health

Second, to support the constituted authorities in the institution, development and administration of all sound policies for the public health of the community

Third, to help coordinate and unify the various lines for work carried on by local public and private agencies that have points of contact with tuberculosis and health problems

Its aims are three namely, to cooperate with the health authorities in public health in the County, to maintain and operate the summer camp, and to further extend a nutritional campaign in the County so far as funds are available.

This Association, cooperating with the local Committee of Newburgh, has maintained for the past four years a health camp, and has now merged with the Middletown-Goshen Convalescent Home for the furthering of this most valuable work Children cared for at this camp are followed-up by the County Public Health nurses, thus enhancing the value of the work started at the camp

In 1926 the Orange County Committee on Public Health was formed by the Board of Supervisors, taking advantages of the State Aid Health law This Committee is composed of three Supervisors, three physicians (preferably Health Officers), and the District Health Officer This committee employs four trained public health nurses who are assisting the physicians in the various public health endeavors that are underway, such as toxin anti-toxin clinics, school examinations and clinics

The Parent-Teacher Associations of this County are working in harmony with the various health organizations and are aiding materially in matters of health education and anti-diphtheria programs

In one city in the County a well organized Child Welfare Committee is working in harmony with the physicians and doing excellent work

Service clubs and fraternal organizations, through committees headed by members of the medical profession, are doing a lot for the crippled and under privileged child These organizations are always ready to assist in any matter relating to public health

School examinations are being conducted throughout the County in a very thorough manner Great interest is being taken by the physicians doing this work, and they are assisted by the nurses employed by the Boards of Education, and by the nurses employed by the Orange County Committee With intensive follow-up by the nurses, defects are being corrected and better results obtained

Health Officers are for the most part co-operating with the physicians, and putting over an active health program In a few instances the local

Boards of Health act in a perfunctory manner, and need to be educated by the Medical Profession to a more active interest in their work

This survey of the County Health activities brings out two outstanding facts First, we have no dearth of lay organizations working for improved health conditions, and willing to assist in any way possible Secondly, the members of the County Society are not fully awake to the responsibilities and their opportunities When we stop to analyze the membership of these lay organizations, we find about ten per cent of the members of this Society are actively identified with these organizations We should be leading in, and directing the activities of these lay groups, to the end that the physician assumes his natural place, that is, leading in matters pertaining to public health

EARL C WATERBURY, *Chairman,*
Committee on Public Relations

PRIZE ESSAYS

Essays to be entered in competition for the award of either the Merrit H Cash Prize or the Lucien Howe Prize must be received by May 20th

Essays must be directed to the Medical Society of the State of New York Prize Committee A sealed envelope containing the name of the author must accompany the essay The name on the outside of the envelope must give no suggestion as to the author of the article If any identification marks are made on the thesis it will be barred from the competition

The details of these competitions appeared in the *Journal* March 15th, page 351

ARTHUR J BEDELL, *Chairman*

DUTCHESS—PUTNAM

A regular meeting of the Dutchess—Putnam Medical Society was held at the Hudson River State Hospital, Poughkeepsie, N Y, Wednesday evening, April 10, 1929 Due to last minute changes in the place of meeting it was necessary to call each member of the Society on the telephone the afternoon of the meeting Apparently this worked wonders for there was an attendance of sixty-five or over half of our total membership Dr John A Card presented a comprehensive report of the demands of the legislative committee

Doctor Clarence O Cheney offered the following resolution

Whereas The Dutchess—Putnam Medical Society is informed that the Governor today signed a legislative bill naming the new state hospital to be erected on Long Island the Pilgrim State Hospital after Dr Charles W Pilgrim, a member and former president of this Society

BE IT RESOLVED That the Society express to Dr Pilgrim its congratulation on this signal richly deserved recognition of his service to the state, and extend to him its heartiest wishes for a continued enjoyment of the respect and esteem, not only of the medical profession of the state, but of the thousands of others who have benefited from his wise advice and counsel, and

BE IT FURTHER RESOLVED That the Secretary be instructed to transmit to Dr Pilgrim a copy of this resolution

Drs Sadlier, LeRoy and Jacobus were named committee to take proper recognition of the death of Dr D H MacKenzie

Doctor Eastman Sheehan of the Post Graduate Hospital, New York City, read a paper illustrated with colored motion pictures

Mr George Lane of New York City demonstrated apparatus and color motion pictures shown at the Pan-American Congress at Havana

H P CARPENTER, *Secretary*

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at Eagle Palace, Jamaica, L I, March 26th, 1929, at 8 30 P M, with Dr W J Lavelle in the chair and 71 physicians present.

The following reports were presented For the Comitia Minora by Dr E E Smith, for the Board of Trustees by Dr T C Chalmers, for the Censors by Dr Harry Mencken The following physicians were elected to membership

Leon A Beardsley, M D, 20905 111th Avenue, St Albans

Lawrence Breitbar, M D, 16418 43rd Avenue, Flushing

William R Carson, M D, 2769 Central Avenue, Glendale

Julius Cogan, M D, Eighth Avenue and 21st Street, Whitestone

Joseph J Drago, M D, 44 Woolsey Street, Astoria

Henry William Ephraim, M D, 4260 Bowne Street, Flushing

John Gibson Hill, M D, 3760 82nd Street, Jackson Heights

Murray Kalkin, M D, 6807 Clyde Street Forest Hills

Joseph V Lanza, M D, 376 Ninth Avenue, Long Island City

Michael Pollack, M D, 420 Fifth Avenue, Astoria

Paul S Rosenberg, M D, 3215 30th Street, Long Island City

Joseph H Schwab, M D, 9118 Woodhaven Boulevard, Woodhaven

Report of Legislative Committee by Dr F G Riley, discussion by Dr Chalmers, Committee on Publicity by Dr E E Smith, Committee on Public Health and Public Relations by Dr Carl Boettiger, Committee on Graduate Medical Education by Dr Veprovsky, Committee on Medical Economics by Dr Rohr

The Committee on Medical Economics presented the following resolution received form the Committee on Medical Economics of the Medical Society of the County of New York and moved its adoption, seconded by Dr Friedman, discussion by Drs Mencken and Frey

"The Committee on Medical Economics having noted the widely divergent and frequently inadequate salaries paid physicians by Boards of Health, Charity Organizations, Welfare Organizations and other Societies, recommends that the Society go on record as in favor of a minimum hourly renumeration of $5 00 The Committee further recommends that some means be taken to call this resolution to the attention of all these organizations, such as Health Boards, Welfare, Charity Organizations and other Societies"

Adopted, ayes 24, nays 2

Dr Friedman spoke on taking up the matter of Workmen's Compensation with the Trade Unions by sending members of the Society to address them on the subject No action was taken

MEDICAL WARES

POLLEN EXTRACTS

Hay fever is an irritation of the nose, throat and eyes, caused by pollen grains falling on the mucous membrane of a person who is sensitized to that particular pollen The irritation is a local effect similar to that of a solution of the grains injected into the skin, as in the test for sensitization to pollen or other foreign protein It comes on within a few minutes after pollen grains are inhaled, and it passes off within a few hours The continuation of the symtoms for days or weeks requires the continued inhalation of the pollen Hay fever victims become well within a few hours after leaving a district in which the pollen is produced

The pollen which produces hay fever is that which is borne by the air Bright, showy blossoms produce pollen which is carried from flower to flower by bees or other insects, for it is somewhat sticky and is not borne away by the wind The pollen of flowers which are inconspicuous, such as those of grasses and ragweed, is produced in great quantities, and it is extremely light and is readily carried by the wind Although the pollens of roses and goldenrod are insect borne, yet a person applying his nose to a bouquet of either flower, and sniffling forcibly, may inhale some of the pollen and so may induce an attack of hay fever, but the attack will last only a few hours because he will not inhale any more pollen under ordinary conditions

A person may live free from hay fever in a locality in which pollen is produced, provided he lives in a room from which the pollen is excluded by a suitable air filter A practical device for screening and filtering pollen from the air is sold for the benefit of invalids who cannot be removed from an infested locality the pollens which are the cause of nearly all cases of hay fever are of three groups, (1) trees in early spring, (2) grasses in early summer, and (3) ragweeds in late summer and early fall

The principal trees which produce hay fever in New York State are those whose blossoms are borne in catkins, such as the poplars and oaks, and the walnuts The earliest grass to produce hay fever is usually the sweet vernal grass which grows wild in fields and woodlands Later come the cultivated grasses The greatest cause of hay fever in New York State is probably the ragweed

A hay fever victim is usually extremely sensitive to only one kind of pollen, although he may also be somewhat sensitive to the pollen of a closely related plant The identity of the guilty pollen may be determined by skin tests made with extracts of the pollen A drop of the extract is placed on the forearm and the skin beneath it is very lightly broken or scarified, so that a slight amount of the extract is carried into the skin If the person is sensitive to that particular extract a white wheal surrounded by a red area will appear in about twenty minutes When a test is made, a series of different pollens are usually applied in a row down the arm An extremely small amount of the pollen extract will produce noticeable results when it is introduced into the skin of a sensitive person A pollen unit is one-millionth of a gram of pollen

The prevention of hay fever consists in the production of immunity to the pollen by the subcutaneous injections of increasing doses of an extract of the suitable pollen beginning with two and a half pollen units and giving it daily for fifteen days in increasing doses until the last dose consists of three thousand units Immunity will be produced in about three weeks, but it lasts for only a few weeks, and must be repeated each year, beginning a month or two before the usual time of appearance of the attack of hay fever

Pollen is prepared for testing and for immunizing by extracting it with two parts of glycerine and one part of a saturated sodium chloride solution The pollen is wet with the extracting solution and is ground in a mortar with ground glass for hours in order to break up the grains and cause them to go into solution

The extract is tested and its strength standardized by complement fixation tests with the blood of rabbits which have been immunized by the injection of the extract The standard solution is put up in capillary tubes for making skin tests and in vials for treatment. Directions for giving the tests and treatments are supplied by the manufacturers

Collecting pollens is properly the work of an educated expert Bunches of the flowering parts of the plants are collected with care and are suspended over sheets of paper which catch the pollen as it falls The pollen is sifted through a fine sieve and is dried over calcium chloride The last process of the storage is the extracting of the air from the storage bottles in order to withdraw all traces of moisture Pollen kept dry will remain unchanged for years, but in the presence of only a trace of moisture it becomes disorganized The production of pollen extract which is reliable under all conditions requires the use of a well equipped biological laboratory and the exercise of technical skill equal to that of the best laboratories of medical schools and institutes of research

THE DAILY PRESS

THE GORGAS LABORATORY OF TROPICAL RESEARCH

The New York *Times* of April 3rd carries the following account of the Gorgas Laboratory which was dedicated on April 2nd

"The site of the Gorgas laboratory is just outside the city of Panama in the region of Bella Vista on the seashore It was donated by the republic of Panama, which also will build the laboratory at an estimated cost of $750,000 This will cover only the cost of the building

"Assurances have been given by many Latin American Governments that they will contribute to the permanent maintenance of the laboratory The purpose of the laboratory is to make studies of tropical diseases not only a protection to life and property in the Canal Zone, but also a protection to the United States against the influx of diseases which might become indigenous there

"The building which houses the laboratory was built by the Panama Government as a medical school, but was never used It has been lent to the laboratory until permanent quarters can be obtained

"The American Congress last year appropriated $50,000 annually to support the work in which all Latin-American countries were invited to participate"

IMMORTALITY AND ETERNAL LIFE

The New York newspapers of April 1st carried pages of reports of Easter sermons The New York *Herald Tribune* featured one by the Rev Harry Emerson Fosdick on the difference between immortality and eternal life which will appeal especially to physicians Dr Fosdick said

"Immortality is going endlessly on Eternal life is entering into a kind of experience so full of meaning that it is worth going on with, and is a quality of experience There is only one condition under which immortality is desirable, namely, that one shall have also eternal life—a quality of experience so full of meaning that it makes going on worth while

"The practical upshot of this distinction is clear—quit postponing eternal life That is something which begins here Now is the time to go to Heaven Do not wait! Heaven is a quality of experience which begins here. I deeply believe in immortality I have as many unanswered questions as anybody about what lies beyond death, but I am confident that life lies beyond death

"What gives me concern, however, for myself and everybody else, is not immortality, but eternal life To have a quality of experience, which beginning here is worth going on with because there is meaning in it—that is the supremely important matter"

RATS AND DUMPHEAPS

A real health menace of dumpheaps containing garbage is the rats which always inhabit them How to get rid of the rats is a grave problem The President of Queens Borough has called in consultation a professional rat exterminator because the animals are attacking children

The *New York Times* of April 10 describes the rats on the thirty-five City dumps in the Borough, and says

"The modern piped piper explained the manner in which he hoped to exterminate the rodents He said that the rat holes will be sought out and a particularly strong solution of virus will be poured into each nest In many of the dumps now boys find considerable sport in shooting rats with rifles, but this practice is frowned upon by both the police and the borough authorities as dangerous because of the likelihood of stray slugs passing over highways or carrying through windows of houses near the dumps"

The rat virus which the exterminator proposes to use, belongs to the typhoid group, and is dangerous to man as well as to rats Rat and mouse typhoid is not always fatal to the animals, but sick ones and carriers may place the germs in food Newspapers frequently have accounts of outbreaks of diarrhoea caused by food infected by rats and mice It would seem that the virus is more dangerous than lead shot But the most effective way to get rid of rats is to build incinerators for burning the garbage and rubbish on which the rats feed

COSMIC RAYS

When a new force of nature is announced the newspapers speculate on its effects on mankind, for that is the standard by which the daily press judges news values The cosmic rays of Professor Millikan have existed as long as the stars, but their existence was not suspected until the Professor devised the means of making their effects apparent to the human senses The rays which were described in the daily press department of this Journal of April 1, 1928, are similar to the X-rays, but of very much shorter length, and it is presumed that they are also more dangerous to living things

The *New York Times* of March 31 discusses editorially the effects of the atmosphere in excluding the greater part of the cosmic rays and says

"In gigantic celestial crucibles, where temperatures and pressures prevail that can be measured only mathematically, matter is being torn apart and re-created Cosmic rays are released in the process

"Here is a cosmic radiation which easily penetrates over 120 feet of water, or more than a dozen feet of lead The most piercing X-rays and the still more potent gamma rays of radium, both easily stopped by a thin sheet of lead, are innocuous by comparison If we live, it is because of the blanket of oxygen in which the earth is wrapped, he assures us As the powerful cosmic rays pass through they are lengthened into heat waves, oxygen being converted into ozone in the process Thus nature shields us by changing one form of energy into another less deadly, and leaves just a detectable amount for science to wonder whence it comes

"Man acquires a new importance in the light of this new theory of the constitution of stars and of Kuehl's explanation of why the first bit of primordial protoplasm was not instantly killed In the vast interplay of universal forces life perpetually hangs in the balance

"Man must be safeguarded by devices numberless for all we know In the plan of the universe the effect of inundating him with the terrible effulgence of Canopus, Sirius and hundreds of millions of other stars and nebulae was so admirably considered that he lives and evolves in an invisible and impalpable casing which shields him as if it were thick lead"

YELLOW FEVER IN BRAZIL

Physicians generally have thought that yellow fever was extinct on account of news items to the effect that Dr Naguchi could not find cases on which to conduct researches But the newspapers have recently stated the disease has appeared in various parts of Brazil The *New York Sun* of March 25 says editorially

"That yellow jack should be the cause of international ill feeling in 1929 comes as a shock to those who have regarded this scourge as one from which science has freed the world A generation ago quarantines against it were commonplace necessaries of health protection Mosquito extermination was supposed to have rendered them obsolete That it has not succeeded in so doing gives testimony to the fact that in any campaign against disease and disease carriers there is no final victory The fight must be kept up

DUST IN NEW YORK CITY AIR

How much dust is in the air of New York City? The *New York Times* describing the purification of the air in Roxy's Theatre, says

"At the Roxy Theatre, 62,500 cubic feet of air a minute is purified During a week, figuring on the basis of seven thirteen-hour days, 341,250,000 cubic feet of air is cleaned In the chambers at the theatre where the air is cleaned, there is an area of 180 square feet, which is covered to a depth of three-quarters of an inch with dust and cinders The purifying device is about 96 per cent efficient, so we calculate that the air sent through in a week actually contains 11 72 cubic feet of dust and dirt At the Paramount the dust and cinder content averaged almost the same"

"On a basis of New York's square mileage and taking a perpendicular distance of 200 feet as the immediate atmosphere of the city, the total is one thrillion square feet. If the 341,250,000 cubic feet of air examined at the theatre contain 11 72 cubic feet of particles, one trillion cubic feet would contain about 3,000 times as much, or about 35,160 cubic feet, which would weigh 2,100 tons"

OUR NEIGHBORS

SECRETARIES' CONFERENCE IN NEW JERSEY

The *Journal* of the Medical Society of New Jersey devotes seventeen pages to a stenographic report of the conference of county secretaries and reporters which was held in Trenton on January 26, 1929 One of the topics considered was county society reports in the *State Journal* Dr H O Reik, Editor of the *State Journal* said

"Your Journal gives more space to the publication of county society reports than does any other medical journal in the United States On the whole, the subject matter of those reports is noteworthy for its good quality We have often stated that the scientific matter published in that section of your Journal is quite as good as that usually presented in the Original Articles section, and a goodly number of our readers have endorsed that opinion We also find occasion for pride in the fact that we publish now during the year a report of practically every county society meeting held in the state and that we do it in each instance within a month of the date of the meeting"

Dr Reik also commented on the failure of secretaries and reporters to send him the news promptly He also laid down some rules as to the form of articles, but Dr Reik evidently accepts items regardless of the form in which they are written, on the ground that poorly written ones are better than none at all

Newspaper publicity of county society activities was discussed by Dr J B Morrison, Secretary of the State Society, who referred to the medical advertisements inserted in the newspapers of Bergen County by the County Society Dr S T Snedecor, Secretary of the Bergen County Medical Society, described the ten advertisements which have already appeared, the last one reading as follows

WEEKLY HEALTH BULLETIN
WE WANT YOUR OPINION!

For the past nine weeks in this space, the Bergen County Medical Society has published information on current medical subjects such as Diphtheria, Smallpox, Influenza, Health Examinations, Pneumonia, Coughs-Colds, Tuberculosis and Cancer

What do you think of these articles? Have they been helpful? Are there any particular diseases you would like discussed? Any ideas or suggestions?

We need your active interest to help us further the work of this organization designed solely to guard your health and your pocketbook

Your health is *our* business *Your* business is to keep your health

Cooperate with us—your personal opinion is valuable

Please write today to the Bergen County Medical Society at Hackensack, N J

Bergen County Medical Society is composed of 155 qualified physicians who have been licensed by the State Board of Medical Examiners after careful consideration of their training and ability

Before a physician is accepted by this Society he is carefullly investigated as to character and professional status

The fact that your physician is a member of the Bergen County Medical Society stamps him as an honest and qualified practitioner of medicine who has met the high standard required by law for your protection

This is the tenth of a series of articles sponsored by the Bergen County Medical Society
BERGEN COUNTY MEDICAL SOCIETY

OHIO STATE MEETING

The April issue of the *Ohio State Medical Journal* contains the following editorial account of the annual meeting of the State Medical Society

"The program for the Eighty-third Annual Meeting of the Ohio State Medical Association to be held Tuesday, Wednesday and Thursday, May 7, 8 and 9, at the Public Auditorium, Cleveland, will be found elsewhere in this issue of the JOURNAL.

"Unofficially, the meeting opens Monday, May 6, with the annual golf tournament, which will terminate in the evening with a banquet and awarding of the cups to the winners The Cleveland Academy of Medicine has arranged an extensive program of medical and surgical clinics for Monday afternoon and Tuesday morning at the various Cleveland hospitals Schedules for these clinics will be posted at the Public Auditorium, at The Hollenden, the headquarters hotel, and other Cleveland hotels on Sunday and Monday

"The annual meeting will open officially at 9 30

90 FIFTH AVENUE NEW YORK CITY

(*Continued from page 566*)

A M, Tuesday, May 7, with the first general session in Club Room A, middle of the second floor of the North Wing This will be followed immediately by the first meeting of the House of Delegates

"The six scientific sections will hold their first meetings Tuesday afternoon in various meeting rooms of the spacious auditorium as indicated in the program

"On Tuesday evening, the second general session will be held in the Ball Room, third floor, North Wing The annual addresses of Dr C W Stone, Cleveland, president, and Dr A H Freiberg, Cincinnati, president-elect, will be delivered at this session, and a humorous discussion of a newspaperman's view of doctors will be presented by Thurman (Dusty) Miller, editor of the Wilmington *News Journal* and nationally known as a humorous lecturer (Dusty Miller spoke at the annual dinner of the Medical Society of the State of New York in Syracuse on May 12, 1925 Concerning the talk the New York State Journal of Medicine for June, 1925, said "Miller talked on the theme 'I do' at the rate of three hundred words a minute to the accompaniment of apt stories that flowed like a rippling brook")

"The second day, Wednesday, May 8, will open with meetings of the scientific sections occupying the entire morning After the annual organization luncheon at noon for officers and legislative and medical defense committeemen, motion pictures will be shown in the Auditorium Ball Room, the feature film dealing with Harvey's experimental work in studying the circulation of the blood

"While the motion picture is being exhibited, the second and last session of the House of Delegates will convene in Club Room A During this session officers will be elected, resolutions considered and the place for the next annual meeting chosen

"At 3 30 P M, Wednesday, the annual orations will be delivered by Dr W L Keller, Washington, D C, and Dr James S McLester, Birmingham, Alabama

"Dr M L Harris, president-elect of the American Medical Association, will speak at the fourth general session, Wednesday evening, and an address will be made by Dr James J Walsh, New York, professor of neurology at Fordham University and author of numerous books on medical history and scientific medicine

"The eighty-third annual meeting will close Thursday noon at the termination of the last general scientific session under the joint auspices of the medical and surgical section

"Annual reports of the State Association standing and special committees to be presented to the House of Delegates will be published in the May issue of the Journal and should receive the care-

ful consideration of every member, as they discuss many of the vital problems faced by scientific medicine and the profession in Ohio"

LEGISLATION IN THE STATE OF WASHINGTON

The March issue of *Northwest Medicine* contains the following editorial comments on Medical Legislation in Washington State

"The Antivaccination - inoculation - medication Bill, which was originally referred to the Educational Committee of the House, came on the calendar for its second reading On motion of Dr Durant it was rereferred to the Committee on Medicine and later to the House Rules Committee It was considered this would probably be the end of the measure

"The antihospital Bill, which would open the hospitals of the state to patients of all varieties of cults, has been supported by a large and active cultist lobby It passed from committee to the House and an attempt was made to rerefer it to the Committee on Medicine, which was defeated by cultist vote At present it rests with the Rules Committee and its opponents are quite confident that it will die there and not come again to a vote before the House

"Two osteopath bills have received strong support from a vigorous lobby One gives the osteopaths the right to advertise, the other would classify them as physicians These bills were reported out of the Senate Committee on Medicine, with five members opposed and two favoring their passage At this time they are with the Rules Committee and are likely to remain there, unless their supporters muster sufficient strength to present them again before the Senate

"The Senate bill, which would require a jury trial for all insanity cases by the prosecuting attorney, has not been reported from the Senate Judiciary Committee It does not seem possible that such a bill could be favored by legislators to whom was explained the circumstances surrounding commitment of insane people

"A sterilization bill has passed the Senate, providing for the appointment by the governor of a state eugenicist and for the compulsory sterilization of socially inadequate potential parents, whether such persons are in the population at large or in the custody of state institutions Its fate will be awaited with interest"

AVENZOAR
(1075 1162)

Spanish physician. One of the few of his time who had the courage to tilt against Galenism

CALLED "The Wise and Illustrious," Avenzoar realized that palatability in the medicines he was using was a very desirable attribute In the Latin translation of his treatise, "Al Teisir,' it is recorded that when the Caliph needed a purgative, Avenzoar conceived the idea of spraying a grape vine with a purgative solution, and feeding the grapes to his royal patient.

Its agreeable taste makes Agarol, the modern mineral oil emulsion with phenolphthalein, acceptable to the most fastidious patient Because it softens the intestinal contents and *gently stimulates* the peristaltic action, Agarol accomplishes the two most desirable results in the treatment of constipation

Liberal trial quantities at the disposal of physicians upon request.

THE NEW BEDFORD HEALTH CO OPERATIVE PLAN

The New England Journal of Medicine for March 14 contains the following editorial on a new cooperative Health Service experiment

"New Bedford, after three years of study by labor leaders, the Welfare Federation and others, is about to put into effect a community health insurance plan by the establishment of The New Bedford Health Association Annual dues, amounting to $6 a year for adults and $3 for children under 14, will entitle members to a definite amount of hospital care at a minimum cost to themselves

"Two plans are offered, Plan A permitting members to receive hospital treatment for 30 days in any membership year up to a cost of $4 a day, and Plan B entitling members to medical service up to a maximum cost to the association of $200 in any membership year, provided the member pays the first $30 and provided such maximum cost to the association in a case not involving a surgical operation shall be $100

"Three principal objects, it is felt, will be served by the association 1 Persons of limited means will have a way of assuring themselves of hospital care at a moderate cost 2 If the plan works as expected, St Luke's Hospital will have fewer patients to care for below cost and will be able to reduce its deficit and perhaps within a few years to wipe it out. 3 Physicians who now do a large amount of free work in the wards at St. Luke's Hospital will be compensated for their services

"The association, which will get under way with a $2,500 underwriting from the Thompson estate, left for charitable work outside the City of Boston, is to carry on for a period of two years unless its resources become so depleted that the trustees decide to liquidate it earlier At the end of two years it may be continued for four years at the discretion of the trustees, after which its future will be decided by the Welfare Federation, of which it is a bureau

"The medical profession, as well as the laity, will watch with interest any experiment which has a direct bearing on the cost of medical care, a subject which is receiving much merited interest at the present time The establishment of the New Bedford Health Association, as The Evening Standard of New Bedford notes, marks the beginning of a social experiment which is without a counterpart in this country, and which may lead the way to a solution of the difficult problem of hospital and medical care for persons of moderate means"

DOG DISTEMPER CONTROL

The *New England Journal of Medicine* of February 21, has a brief editorial comment on the

(*Continued on page 573—adv xxiii*)

(*Continued from page 572—adv xvii*)

cause of distemper on dogs and says

"Important advances, according to the *London Times*, have been made by the Distemper Research Committee as a result of its labors during the last five years on the causation and prevention of this scourge of dog life In fact, if the report is to be credited, lines of research have been opened up which will have a wide value in the study and control of virus diseases in general, not only in other animals but in men as well

"The most important fact given out in the present announcement is that a point has been reached where it is possible to render dogs resistant to infection by distemper, a fact that has apparently been proved beyond dispute once and for all The investigators, accepting Carvie's conclusion that the agent causing the disease is a filterable virus, have succeeded in immunizing animals against infection by a double inoculation, first with a vaccine which is the sterilized virus of distemper, and then with an attenuated strain of living virus

"England is fortunate that in that country distemper is the most serious disease of dogs that has ordinarily to be dealt with If in this country the layman took rabies as seriously as his English cousin does distemper, we might have hope eventually of stamping out the disease"

X-RAY WARNING

The March issue of the *Journal* of the Michigan State Medical Society contains the following editorial on the need for X-ray pictures

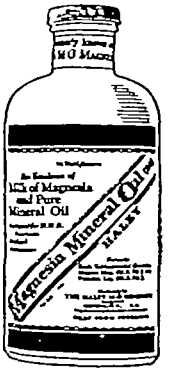
"During February two suits of malpractice were settled In one payment of $2,325 was made for the failure of the doctor to take an X-ray during the treatment of a fracture, and the poor end result was blamed to that negligence In the second case $3,250 was paid in settlement for the doctor who treated a fractured hip without an X-ray

"In the light of these two cases in one month, our attorney urges that a warning be sounded to our members Our attorney advises that the doctor insist on an X-ray in every fracture or suspected fracture If the patient refuses then decline to treat the case

"One becomes grossly liable if he fails to heed this advice, and is headed for legal trouble and an adverse verdict. The courts have gone so far as to rule that in view of present day transportation facilities one is not excusable because in your town you do not have an X-ray The burden is upon you to secure an X-ray of all fractures

"The warning is repeated Decline to treat a fracture or suspected fracture if your patient refuses to have an X-ray Withdraw entirely from the case Unless a doctor follows this advice he may confidently expect a damage suit in his fracture cases where in the X-ray was not used"

Lubricant Laxative Antacid



Uniform, permanent, unflavored emulsion of Liquid Petrolatum (U S P), and Milk of Magnesia (U S P), palatable, non-irritating, does not disturb digestion.

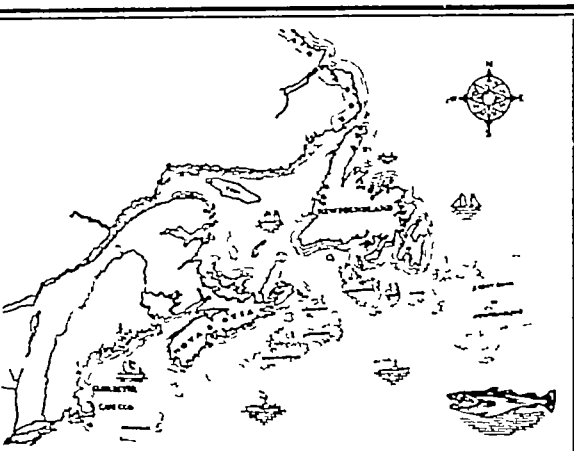
member of their profession without delay But all of them, if the emergency warrants, will be found answering the call for aid from suffering humanity no matter how great the sacrifice they must make themselves"

Less is heard about the problem of securing a physician in the cities, but in certain sections of Brooklyn, the most populous Borough of Greater New York, the people often call an ambulance from a city hospital on the ground that the local doctors refuse to go out at night Moreover, it frequently happens that a city person lies sick for days or weeks without medical attendance, even in the presence of doctors, public health nurses, and social workers Tales of suffering from lack of medical attendance in rural districts can be matched in any city Locating a doctor in every hamlet will not solve the problem of rural medical service



QUESTION AND ANSWER COLUMN

The April issue of Minnesota Medicine contains an announcement by Dr N O Pearce, Chairman of the Committee on Medical Education, that the JOURNAL will conduct a Consultation Bureau for answering questions directly to inquiring doctors and also a "Question and Answer" column in the JOURNAL The announcement says

"For some time we have wished that a Question and Answer column could be run in the Journal for the benefit of our readers Almost daily some question in connection with practice arises in the mind of every practitioner If he has close association with other members of the profession, he is likely to put the question in his mind to someone and get some sort of answer Many of us, however, might appreciate an opportunity to obtain answers from authoritative sources

"The function of this Bureau is to furnish the members of this Association with prompt and confidential information of any subject relating to the practice of medicine The resources of a staff of the most competent consultants in every line of medical endeavor will assist Dr O'Brien in obtaining for you the information desired No question is too trivial and no problem too large for you to submit to this Bureau for an opinion

"The Bureau in addition to furnishing medical consultation will conduct the Question and Answer column for the Journal each month, and its interest will depend on the use made of the Bureau Questions should be sent to the Consultation Bureau at the Association office. There need be no fear of publicity in the matter as all communications will be considered confidential"

The American Cod Liver Oil Map

THERE was a time, not so very long ago, when the fallacy existed that America could not produce good cod liver oil

The Patch workers exploded that theory and helped to revive an old American industry This required a combination of research work and the development of new methods for making oil.

The results have been noteworthy An American Oil of the highest vitamin potency and—by improving the method of production—an oil of pleasant taste

Along the shore line, from Cape Cod to Labrador, are the Patch plants—where the oil is obtained from the fresh livers Out on the Banks are the steam trawlers equipped with the Patch cooker, where the oil is made soon after the fish come out of the water

To increase resistance against disease and to build up energy after influenza and similar conditions—Patch's Flavored Cod Liver Oil, with its high Vitamin A content, is particularly valuable

You should taste this fine American product, so send for a sample, and with the sample we will send you the whole story of how Patch put America on the cod liver oil map

RURAL DOCTORS

The problem of securing a doctor in country districts is nation-wide, and exists in Wisconsin as well as New York, as is shown by the following editorial first printed in the Fond du Lac *Commonwealth-Reporter* and reprinted in the April issue of the *Wisconsin Medical Journal*

"Senator Cashman has warned the medical profession in the state that if doctors in the cities refuse to respond to sick calls from rural districts he will seek special legislation to have their licenses revoked

"In all justice to the doctors and rural folk alike we're wondering whether there isn't some misunderstanding in the matter

"While it may be that there are some physicians in the cities who would refuse to make a call in the rural zones under any conditions, they are the exception, not the rule

"Doctors, of necessity, must endeavor to maintain certain office hours and limitations on the extent of their field of practice if they would serve their patients to the best of their ability But even so, there are few physicians who will not respond to the call of suffering humanity no matter when and from what source received

"Senator Cashman says that the patient in the country can not always go to the city for medical aid That's true But neither can the doctor always get to the rural patient

'During the recent snow blockades it seems a rather significant fact that the only travelers over some of the blocked highways were the doctors They got through where mail men, even farmers, could not, doing so in response to the call of the afflicted Let's consider those instances before condemning the medical men as a whole because of the acts of a few

"Furthermore, it is a recognized fact that the number of country practitioners is steadily decreasing The rural neighborhood doctor has moved to the city where facilities for the proper treatment of patients in the way of hospitalization and so on are not lacking His move in this respect has been the result of the natural trend of rural folk to the urban communities in quest of medical service because of the added advantages the latter provide And what's more natural than that the doctor should follow his patients in this respect?

"This change has been due principally to the steady improvement of transportation conditions especially the use of the motor car And it's when such transportation is lacking or impeded that some of the cases of which Senator Cashman says he has heard have probably occurred

"There are some doctors who will not respond to an ordinary sick call in the country, but even so when such calls are received they usually see to it that the summons is responded to by some other

NEW ENGLAND MEDICAL COUNCIL

The New England Medical Council consists of delegates from the six New England states The meeting of June 19 was reported by Dr B U Richards in the March issue of the *Rhode Island Medical Journal,* with considerable frankness as follows

"Being the only member of the New England Medical Council from Rhode Island attending the last meeting, I submit briefly a report of that meeting

"The program consisted of reading and discussion of papers dealing with the drugless cult problem

"It was voted that speakers be furnished to the Maine Medical Society for the purpose of combating an amendment to an osteopathic bill which will be presented in Maine early next year

"The object of the Council appears to be to do away with medical journals published in New England except the one published in Boston Our transactions are well presented in our own journal, and it is improving from year to year It is one of which we are all proud, and I am in favor of continuing its publication

"The other matter which the Council is much interested in is reciprocity This is an impossibility as Rhode Island has for many years and now maintains a higher standard for its candidates than is required in any of the other New England States Reciprocity under the present conditions cannot, therefore, be considered, except by the adoption and use of the individual endorsement certificate.

"I have reviewed very carefully the report of the two previous meetings of this Council, and was in attendance at this, its third meeting I fail to be convinced that it has resulted in very much benefit to any party It certainly has not to the medical profession in Rhode Island"

NEW YORK STATE JOURNAL of MEDICINE

PUBLISHED BY THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Vol 29, No 10 NEW YORK, N Y May 15, 1929

A FORUM ON THE PRACTICE OF MEDICINE BY ORGANIZATIONS

EDITORIAL FOREWORD

A forum on the practice of medicine by four of the most prominent organizations of New York City was conducted by the Medical Society of the County of New York at its stated meeting on March 25, 1929 The four organizations whose work was described by their own speakers were the Medical Center of Columbia University, the Cornell Pay Clinic, the Bellevue-Yorkville Health Demonstration, and the Life Extension Institute A discussion of these organizations from the standpoint of practicing physicians was then given by Dr Charles Gordon Heyd, Treasurer of the Medical Society of the State of New York

It was a happy coincidence that just before the Forum, Dr James Alexander Miller discussed the four organizations in a kindly, judicial manner, at a meeting of the Advisory Council of the Milbank Fund His article follows immediately after the Forum, and may be considered to be a contribution to it from the standpoint of an impartial observer

THE PROFESSION AND THE MEDICAL CENTER

By WILLIAM DARRACH, M D

DEAN, COLLEGE OF PHYSICIANS AND SURGEONS, COLUMBIA UNIVERSITY, N Y

ON behalf of the various institutions comprising the so-called Medical Center, I welcome this opportunity to explain what we are trying to do, and to hear from you at first hand just what it is that you object to The center is composed of the College of Physicians and Surgeons, The Presbyterian Hospital, The Sloane Hospital for Women, the Vanderbilt Clinic, the Neurological Institute and the Babies Hospital

These separate institutions have been active for a long period, and are now continuing the same kinds of work, but in a different environment The various institutions have simply rebuilt their homes practically under one roof and are cooperating more intimately than before

The clientele of these institutions in their former locations was not as localized as one might imagine A few years ago a study was made of where the patients of the Vanderbilt Clinic came from The city was divided into districts and the patients' homes separated accordingly The district bounded by Fifth Avenue, the Hudson River, 125th Street and 23rd Street contained approximately 14% of the total attendance Not only were all other districts of Manhattan strongly represented, but Brooklyn and the Bronx had almost as high percentages with a surprisingly large proportion coming from Long Island, New Jersey, and Westchester A similar study of the patients coming to Presbyterian showed very similar results I believe that similar conditions prevail in each New York hospital None of us are local institutions, as patients will go to the place where they think they can get what they want, irrespective of where it is The various institutions now working at the Medical Center have simply moved into a new district, and their former clientele continue to come to them for medical care

A good deal of the publicity which the newspapers have given to the Medical Center has been distressing to the staff, some of it humiliating and even nauseating But as most of you realize the press is rather difficult to control It was necessary for the Board of Managers of the institutions to go to the public for funds to complete their buildings Apparently any money raising campaign depends somewhat on publicity for its success When the Presbyterian, Neurological, and Babies' campaigns were on, an earnest effort was made to control the character of the propaganda material It was agreed by the Joint Adminis-

Practicing, to take an ethical interest, without investment in a high class therapeutic product of merit, as advisory correspondent. No interference with practice. Address Box 99 N Y STATE JOURNAL OF MEDICINE

IDEAL LOCATION FOR SALE for building Sanatarium or hospital. Will sell any number of acres up to 100 On State Road, altitude 2 140 feet, electricity, pure water, coal mines nearby Highest point on Susquehanna Trail For particulars, write Mrs R P Douglass, Mountain View Inn, Blossburg, Pa.

599 West 187th Street (corner St. Nicholas Avenue)—Parlor floor and basement, 5 rooms and 2 baths Southern exposure suitable for physician or medical institute. Can obtain balance of building, if desired for sanitarium. Ideal location. Low rents. Inquire on premises

DRYCO

An unrivalled record of results over a period of many years, has definitely established the fact that Dryco is ideal for infants deprived of breast milk and is of especial value in difficult feeding cases

It is significant that this milk has long maintained steadily increasing prestige with the medical profession and is prescribed by leading pediatrists all over the world See page XVII—*Adv*

AGAROL

Its agreeable taste makes Agarol, the modern mineral oil emulsion with phenolphthalein, acceptable to the most fastidious patient. Because it softens the intestinal contents and *gently stimulates* the peristaltic action, Agarol accomplishes the two most desirable results in the treatment of constipation See page XXI—*Adv*

PATCH'S COD LIVER OIL

An American Oil of the highest vitamin potency and—by improving the method of production—an oil of pleasant taste.

Along the shore line, from Cape Cod to Labrador, are the Patch plants—where the oil is obtained from the fresh livers Out on the Banks are the steam trawlers equipped with the Patch cooker, where the oil is made soon after the fish come out of the water

To increase resistance against disease and to build up energy after influenza and similar conditions—Patch's Flavored Cod Liver Oil, with its high Vitamin A content, is particularly valuable

You should taste this fine American product, so send for a sample, and with the sample we will send you the whole story of how Patch put America on the cod liver oil map—See page XXVI. —*Adv*

"COUNCIL PASSED"

Notification is being sent to the medical profession that the well known and deservedly popular Haley's M-O, Magnesia Oil has been accepted for N N.R. of the American Medical Association. Henceforth the product will be known as Magnesia-Mineral Oil (25) Haley It was certainly a happy thought to combine Liquid Petrolatum and Milk of Magnesia in the form of a permanent, uniform, unflavored emulsion. The taste is not at all unpleasant and the absence of any distinct flavor prevents the habitual user from growing tired of it.

The value of mineral oil as a lubricant and emollient for the treatment of certain forms of obstipation has been well established. In many cases, however, there is added to the need for lubrication the indication for the use of a mild laxative and antacid for which purpose years of clinical use have demonstrated Milk of Magnesia to be ideal

Practically, there exists in many cases of intestinal stasis and constipation a hyperacid condition which calls for the use of an antacid.

Magnesia-Mineral Oil (25) Haley has therefore a therapeutic field considerably broader and more diversified than is the case with either one of its ingredients considered singly

The little booklet, "A Gift from the Gods" has met with a very flattering reception and will be sent to physicians upon request, with a sample for clinical trial See page XXIII.—*Adv*

New York Post-Graduate Medical School and Hospital

The Dean 302 East Twentieth Street New York City

scious" The latest medical discoveries soon become known to the public People still like the magic of human sympathy and the mysticism of personality, but they want the art of medicine mixed with a little medical science. They know that modern medicine calls for costly technical tests, which cannot be made during a short office visit They want a better distribution of this kind of medical care, not as a dole on charity, but as a commodity for which they are willing to pay within their means They resent being subjected to under cover investigation or herded through dispensary corridors by unmannerly attendants, as if guilty of vagrancy

Dr M L Harris, President-Elect of the American Medical Association, deploring the decline of the American family physician, overspecialization of medicine, and invasion of medical practice by various voluntary and industrial organizations, has come to the conclusion that the only way for physicians to regain the confidence of the people is for medical men themselves to organize community medical centers In closing a recent address and referring to such medical center he states "It should keep the control of the sick within the confines of the profession and not allow it to drift into the hands of lay organizations"

In almost every respect the so-called "Cornell Pay Clinic" conforms to the plan suggested by Doctor Harris, with which you are no doubt familiar The Clinic is a medical organization whose control is entirely "within the confines of the medical profession Its procedures are initiated and executed only by doctors Members of its medical staff are paid for their services, and medical salaries have been increased as rapidly as the income of the clinic has permitted No pretense is made that this compensation is equivalent to what might be earned through seeing the same number of patients in private offices, but is it necessary to state that affiliation with a teaching institution, under stimulus of medical research, are advantages aside from the monetary return? Nor should it be a reflection on the quality of medical service to look at positions on the clinic staff in the light of part-time graduate fellowships" Osler once said "The medical work of an institution where teaching is not done, is seldom of the highest class" Academic environment makes for better medical service and raises the standard of the medical profession in the community It is a benefit not merely to members of the clinic staff

Conforming again to Dr Harris' proposed plan, patients taken by the Cornell Clinic pay at rates within their means, rates that are approximately one-third of those charged in private offices Those able to pay the regular charges of private physicians are asked to return to their own physician, or, if they have none or do not know of any, are given a list of four physicians, preferably located near their home, following the special branch of medicine called for by the apparent condition More than 1100 applicants were referred to outside specialists during the last year, while during the same period more than 500 applicants, known to have a family physician or to have been treated recently by an outside doctor were refused admission

Just what a given individual can or ought to pay for sickness is difficult to determine on any schematic basis Much depends upon sociological factors, character of illness, duration of disability, and unusual costs of long illnesses The statements of some who have been rejected because they were rated above the maximum income level, telling of savings depleted on account of hospital or medical care, often without benefit or relief, would be significant, were there time to relate that at length

A series of one thousand diagnostic cases, admitted during the year 1928, is now being subjected to critical study to find out for ourselves how we can make this service better It is hardly necessary to state that patients referred to the clinic for diagnosis are invariably referred back to the physician sending them and never accepted for treatment unless such request is made or confirmed by the physician himself Any failure to observe this rule, if brought to the attention of the Clinic and College authorities, would be acted upon immediately

The question has been raised as to how many of the patients admitted are actually used for teaching purposes While some patients are admitted especially for teaching at request of members of the Faculty, every patient admitted is available for teaching As a general procedure it would be hard to conceive of patients being selected at the door on the basis of suitability for teaching, without any history or physical examination. Medical teaching today is not limited to amphitheatre demonstration The best kind of clinical teaching is practical assigned work It is of no great advantage for students to be shown unusual or rare conditions Rather is it of practical value to have them obtain first hand knowledge of every-day conditions they will meet with in outside practice and learn to treat these

The important and relevant question whether the "Pay Clinic" experiment is seriously interfering with the practicing physician might be submitted to some body of disinterested investigators and perhaps will be included in the studies of the "Committee on Cost of Medical Care" It may be stated again that the authorities of the University and College who have directed this experiment, as well as mem-

trative Board that everything of a professional nature that was given out should first be submitted either to the Dean's office or to the department concerned But in spite of all our efforts certain uncensored articles were given out The great difficulty lay however not in what was given out to the press, but what was published by them Newspapers always feel that they must rewrite everything that comes to them and I need not explain to you what can happen to "rewrites" We realize that our earnest efforts were imperfectly successful and no one regrets more than the staff, some of the statements that did appear in the public press It may be of interest to know that the "department of public relations" of the Joint Administrative Board stopped functioning last December

The various hospitals at the Medical Center, have the same difficult problem that other hospitals have in preventing undeserving cases from using the out-patient and ward opportunities Here again our earnest efforts have been incompletely successful We have found a number of patients, both in ward and clinic, who should not have been admitted There undoubtedly have been others whom we did not discover The machinery set up to obviate this has been working more smoothly of late than it did at first It was necessary to open the out-patient department before either the buildings were completed or the administration staff entirely assembled and broken in Part of our difficulty was undoubtedly a back-fire from the undue publicity We had expected after two or three years that the Vanderbilt Clinic would be handling a thousand cases a day To our amazement the numbers have already passed thirteen hundred and it has been necessary to limit admission in most of the departments With such unexpected numbers it has been difficult to adjust the investigative and admitting machinery The number of cases who are referred back to their family physician is increasing steadily

For several years the Presbyterian Hospital has endeavored to keep the physician who sends his patient to the hospital in touch with what is going on A former member of the visiting staff, who was compelled by a crippling accident to give up his practice, has given his entire time to this work Letters are sent to the patient's physician describing the findings, diagnosis and proposed treatment and before the patient leaves another letter is sent out telling of his departure with further notes on progress and treatment We have been disappointed that so few physicians have acknowledged these letters Since we moved last April, 780 such letters have been sent I am afraid that patients will always do a certain amount of "shopping around" before they decide on where they will have their operation or their confinement It is annoying when we have spent time and energy on a case to learn later that they have preferred to go elsewhere for their treatment But surely we cannot begrudge this freedom of choice to the patient, nor should we blame the other physician who is probably quite ignorant of the former visit.

When an institution provides medical care free or for a nominal charge to patients who can afford to pay a private physician, they are in error unless they have made proper effort to find out the patients economic situation But only too often in such cases the blame should rest on the patient who has falsified his condition The fair thing for the patient's physician to do in such instances is to complain directly to the institution giving specific names and when possible dates We have repeatedly asked for such information but the complaints to the Board of Censors and others, far outnumber those received directly

---

THE PROFESSION AND THE "CORNELL PAY CLINIC"

By WALTER C KLOTZ, M D, DIRECTOR, NEW YORK, N Y

THE so-called "Cornell Pay Clinic" experiment was begun November 1921 Its purpose was to give good medical care to persons unable to pay private doctors but who did not belong in the free dispensary group

How about the patient who is not bedridden or totally disabled, the ambulant patient who seeks medical care before he has developed more serious illnesses? Must we not concede to him an equal right to seek medical care without sacrifice or self-respect and to pay for such care within his means? Appealed to by the committee on Dispensary Development, the President, Trustees and Medical Faculty of Cornell University undertook the experiment of providing ambulant medical care for persons in moderate circumstances, on a basis of approximate cost It was undertaken to meet a community problem with no idea of advantage to the College except the educational one of demonstrating to its students a better type of medical service than had been possible in the former teaching dispensary It was hoped also that through its diagnostic service the "Pay Clinic" might assist private physicians whose patients could not pay consultation fees of specialists

There is proof that an increasing number of the 65,000,000 of our population who have reached voting age are becoming "Health Con-

by the family physician any whom they know to have been exposed to contagion

Nor have these things been done secretly The independent societies, of which we have four in the area in which we carry on our activities, as well as the County Medical Society's Committee on periodical health examinations, have been kept fully informed, and as far as I am aware have been fully in accord with these educational activities

The goal of our efforts, the ideal which we would like to realize, if possible, and on the realization of which our demonstration would logically cry *quod erat demonstrandum* would be that every family in our area had come under the professional care of a qualified general practitioner, calling in specialists when advised by their physician to do so, and that vaccination against smallpox, immunization against diphtheria, and when exposure seemed likely, against typhoid and other epidemic diseases, should be administered in the course of such general professional care, while, of course, all acute illness would be dealt with in the same way whether at home or in a hospital

In our educational program, directed primarily towards the lay public, we have not ignored the necessity of post graduate courses for practicing physicians in the technique of the general physical examination Such courses, given by specialists, qualified technical experts of outstanding professional reputation, are, we think, an integral part of any sound program, and it is our purpose in consultation with organized medicine to extend such courses

A plan has been discussed favorably for offering to students and recent graduates of the medical schools some definite and supervised opportunities for field work in preventive medicine It is plausibly urged that unless our future practicing physicians are inoculated early with the notion of health supervision, preventive medicine, they are very likely never to become really at home with it. In our relations with the Health and Hospital Departments, with the Henry Street Nursing Service and the social agencies, and with the schools, there are opportunities which we think might be utilized for teaching purposes

We have a plan for trying to make the medical school inspection more useful and more economical Details of this plan are still to be formulated, but the Chairman of our Council, Dr Wynne, and the Director are agreed from the start to recommend that the children in our public and parochial schools shall be conceived as falling into three distinguishable groups First are those whose examinations will be made entirely by their own family physician and entirely at the expense of their own family

There are next, as we see it, a probably much larger number of children whose parents would be financially able to pay a moderate fee and, on responsible advice from the school, would really prefer to do so, provided, of course, the child would for such a fee come into the hands of a competent, conscientious physician

Our third and residual group would include those children whose parents either could not or would not pay for the examinations, even when fully advised of their value and urged to do so These children also would have to be examined at least once when they enter school and again when they leave—at least if they want working papers It might be twenty-five per cent of all It might be seventy-five per cent. For this residual group it may be better to continue the present plan of part time medical inspectors or an annual salary

It is true that in certain clinics and services in our building free treatment is given, for example, for venereal disease and for tuberculosis, and to babies and to pre-school children, and that in others a nominal charge is made such as would not provide adequate compensation for physicians in regular practice. What is significant, however, is not that such services are given in our building as they are elsewhere, and generally in fact as a part of a city-wide system What is of interest is the trend of development, the direction of change, the relative emphasis, and as to this I repeat what I have said already that the emphasis is put, the influence of the Demonstration is exerted, in the direction of the private practice Increasingly the clinics in our building are regarded as provisional, as transitional, as a means of supplementing private practice and increasing it, as a means of promoting the practice of preventive medicine by family physicians

Physicians will find the Bellevue-Yorkville Health Center ready to their hand as one among local available remedies for the falling off in the amount of curative medicine What their relation to it is to be, in view of our program as I understand and have tried to interpret it, depends upon them, upon you It would seem that it can be a very helpful one Here a wide open, hospitable door of opportunity invites you We have no traps, snares, ulterior motives, subtle schemes, overweening ambitions to complicate the opportunity You will not have to resort to detective methods to find out what we think or what is going on Our desire is that medical questions shall be decided by medical men, as financial questions should be decided by financiers, and political questions by statesmen, all, of course, subject to democratic discussion and control in the common interest

bers of the medical staff, have been guided by the policy of refraining from anything that might prejudice the interests of the medical profession They have endeavored to observe ethical principles more rigidly than is usually the case between physicians in private practice Effort is made to restore patients' confidence in their family physician and urge them to return to him

References have been made to unfortunate press notices which appeared at the time the experiment was inaugurated in 1921 None of these notices had been authorized by the College and they were suppressed as rapidly as possible In fact the Clinic has been most anxious to avoid any notice that would stimulate applications beyond existing physical limitations

Whether or not the experiment will terminate automatically with the completion of the plant of the New York Hospital-Cornell Medical College Association cannot be stated The physical limitations of the present building preclude any expansion The admission rate maintained during the last three years represents the ultimate limit of capacity There is no possibility that it will be increased and constitute any serious menace by reason of its volume

In the sense that any medical institution enters into competition with some of the medical profession, the Clinic may be considered a potential competition The question arises what probability is there that patients selected on the basis of present income levels would consult private practitioners in their offices? Is there not more likelihood that they would seek treatment in free dispensaries or those charging nominal fees, or that they may seek advice of irregular practitioners, quacks or cults? Under existing conditions it is not probable that the Clinic is competing seriously with the well-trained, competent, and conscientious practitioner, equipped to give the same quality of service, even at a reasonably higher fee

The Cornell Clinic represents a form of medical organization under medical leadership and control, and as such may hold in check or forestall the industrialization of medicine in this country, and help lay the ghost of "State Medicine"

Founded on medical and social ideals, with scientific aspirations in sympathy with medical traditions, the "Cornell Clinic" ought to be and some day will be appreciated not as a menace, but a benefit to the American Physician of similar ideals and aspirations, with whom it only wishes to cooperate in a spirit of professional respect and fraternal regard

---

THE PROFESSION AND THE BELLEVUE-YORKVILLE HEALTH DEMONSTRATION

By EDWARD T DEVINE, PH D, NEW YORK, N Y

I CAN imagine no happier fate for one who is not himself a physician in general practice than to be a social economist, associated with representative members of the medical profession in the promotion of public health measures and in the care of the sick

Since receiving the invitation to speak here, I have somewhat carefully studied the declared objectives, the developing programs, and the documentary reports of progress of the Bellevue-Yorkville Health Center, of which, as you know, I have only recently become director, and I fail to find in them any hint of objective, program, or activity which is inconsistent with the fundamental principles that both the healing of the sick and the keeping fit of the well is the legitimate work of physicians, and that in such professional labor, as in all honorable labor, the laborer is worthy of his hire

Apparently my predecessors and associates have consistently worked to stimulate cooperation with the local medical profession and have consistently responded when the initiative has come from the other direction Apparently they have steadfastly kept in view the mutual interests of the private physician and of those who need education, examination or treatment Our own efforts have been mainly directed toward research and experiment, co-ordination of organized agencies, the application on a larger scale of accepted public health principles and practices, and the carrying out of the actual program of the American Medical Association and the State and County Medical Societies in the periodical health examination of children and adults We appreciate the approval given within the past few weeks by your Society of the temporary emergency service which we have had to create because of the unexpected success of our propaganda on this subject among school children

We have tried to interest people in their own health—one of our five principal objectives as originally formulated seven years ago—and a large fraction of that effort has taken the form of urging people to go to their family physician when they become aware of disturbing symptoms, to remain under treatment if their condition calls for it, instead of being content with the disappearance of such premonitory symptoms, and to marshall in for examination

alone applies a sufficient brake upon any excessive profits on the part of the stockholders and directors As a matter of fact no dividends at all have been paid on the common stock and there are no prospects of any being paid for years to come It is only fair to keep in mind that had the president of this organization received a reasonable salary, such as is usually paid to an executive who holds together and builds up an institution of this kind breaking into a new field as a pioneer, the Institute now would show a deficit and no dividends of any kind would have been paid

Is this the picture of an ordinary commercial organization?

During the fifteen years that the Institute has been in existence, however, it has paid in medical fees to physicians conducting this examination work, $1,400,000 Also it has made contributions to philanthropic public health work of more than $40,000—most of this before the Institute assumed the payment of dividends to its stockholders It has, since its organization, paid in cash dividends on its preferred stock less than savings bank interest of approximately 2 per cent on the money invested All royalties from our books, one of which has reached a sale of more than 220,000 copies, are devoted wholly to philanthropic public health work (for example, contributions to such organizations as the Academy of Medicine and the National Health Council)

Another term that has served unfairly to discredit the Institute is "advertising" These three terms—"lay organization," "commercial organization," and "advertising"—constitute probably ninety per cent of the ground of misunderstanding between the Institute and the profession

What ethical warrant is there for the Institute's advertising? In this field of preclinical medicine the great task is to arouse the interest and enthusiasm of people for keeping well, and for seeing their doctors before disease is manifest. This is going contrary to human nature. It is the hardest thing in the world to sell The practice of periodic health examinations cannot grow through a static and merely receptive attitude on the part of the medical profession It is the business of someone to educate the public and teach them that they must take the time and be willing to spend their money if they expect to get thorough examinations

The Institute does not see itself as monopolizing service of this kind It conceives its destiny to be that of a great demonstration center, accomplishing, through publicity and advertising, what the individual physician or even the medical society cannot hope to do In its service to life insurance companies it has a special function and may justly hope for an even greater development In that field it is more than a demonstration center—it is a great health service institution benefiting the people generally and also the medical profession

In January of last year a meeting on the subject of periodic health examinations was held at the New York Academy of Medicine under the auspices of the public health education committee of the Medical Society of the County of New York When I say that among the speakers were Dr Wendell C Phillips, Dr Samuel W Lambert, Dr C Ward Crampton, and Dr Louis I Dublin, it will be apparent that a very rich feast was offered both to the profession and to the public on this subject

When I entered the hall I found the speakers were all there but there was no audience—unless you call half a dozen people an audience Perhaps twelve people were assembled by the time the speakers got into action I asked Dr Lambert what he thought of the situation He said, The thing they ought to be most interested in they are least interested in I then asked, What is the further lesson? Is it not that it is someone's business to carry this message far and wide and arouse both the public and the profession to the importance of this preclinical work?

That explains and justifies the Institute's advertising The majority of those who come to the Institute through our advertising would not seek an examination unless thus prodded They would not go to the family physician or anyone else for these examinations, but they might well fall into the hands of quacks and charlatans or cults and isms The Institute is advertising for the whole medical profession We believe that for every person induced to come to the Institute, a hundred have gone to their family physicians as a result of the money we have spent in advertising In the year 1928 approximately 100,000 people were advised after examination to go to the practicing profession for treatment.

At a meeting in 1923 of the Committee on Civic Policy of the Medical Society of the County of New York, where I presented in detail the organization of the Institute for the committee's consideration and explained the conduct of our work, it was agreed between the committee and myself that certain paragraphs should be included in the advertisements of the Institute, as follows

"Do not neglect to have these periodic health examinations by your physician or by the Institute or any other accredited scientific agency where the work can be competently done."

"The Institute renders no treatment, performs no operations, but makes a scientific survey of your life and body and submits a report that assists your physician in making final diagnosis and applying the necessary treatment or correction of your physical defects"

It was also agreed that the following instruction should be stamped on every report issued

THE PROFESSION AND THE LIFE EXTENSION INSTITUTE

By EUGENE LYMAN FISK, M D, MEDICAL DIRECTOR LIFE EXTENSION INSTITUTE, NEW YORK, N Y

IT IS not an easy task to clear up the misunderstandings of fifteen years in fifteen minutes I can only tell you the simple truth about the Institute and leave you to judge as to the bearing of the evidence

The terms in which men think are often responsible for differences of opinion, friction, and mutual misunderstanding One of the terms that has given rise to much misunderstanding is that of "lay organization" Another is "commercial organization"

I am sure that no one has ever thought of calling the Harvard Medical School, the Cornell Medical School, the Yale Medical School, The College of Physicians and Surgeons, the medical departments of the United States Army and Navy, or the United States Public Health Service, "lay organizations" Yet I maintain that they are just as much, and in some respects very much more lay organizations than is the Life Extension Institute Every one of them is under the ultimate control of a lay president and of lay boards

The Life Extension Institute is organized as follows There is a president—a layman—serving without salary, there is a vice-president and medical director—a physician, of course, and there is a lay secretary The president is also treasurer of the organization The board of directors is composed of thirteen laymen and two physicians—Dr Haven Emerson and myself Every one of the directors—except the physicians, of course—is a man of wealth and business power who has no need to seek profit from a medical organization, and most of them have given generously of their time and money to such service in other fields Robert W de Forest, Horace A Moses, and Professor Irving Fisher are outstanding examples There are also department heads, secretaries, statisticians, technicians, and clerks numbering approximately 175 The lay officers and board of directors of the Institute have nothing at all to do with the direction of its scientific policy or its strictly medical work This is wholly in the hands of the medical director and his aides

To what extent is the Life Extension Institute a medical organization? There is, as I have stated, a medical director There are also an associate medical director, two assistant medical directors, a medical director of the Boston Office, a medical director of the Chicago Office, and, in these three centers, a medical staff composed of whole-time and part-time physicians numbering sixty-nine Throughout the country the Institute has listed 9,500 physicians, the majority of whom are members of the American Medical Association, serving on a fee basis Two thousand of these physicians have been added in the past two years

Back of this operative medical organization concerned chiefly with the fundamental work of physical examination, there is the Hygiene Reference Board of the Institute, composed of some seventy-five members, all of whom are eminent in the field of medical education or health work The members of this board have never received any compensation It is to this board that the medical management of the Institute appeals for counsel on mooted questions of health education and medical policy

To call such an organization a "lay organization" is distinctly misleading in practice as well as in theory This brings us to the second misleading term I have mentioned—that of "commercial organization" The Institute was organized deliberately and advisedly on a semi-commercial basis, with capital stock, in accordance with the best judgment of its founders, including Mr Taft, Robert W de Forest, and other public-spirited men who believed that was the best way in which to insure its growth Only as a business organization could it serve life insurance companies and perpetuate its work, without passing the hat or depending on charitable contributions

However, seeking to safeguard the distant future of the Institute, not long ago all the directors and stockholders signed an agreement to turn the stock control over to a group of large universities Before taking the plunge, several men eminent in medicine and public health work were consulted, including Dr Ray Lyman Wilbur

How does the Life Extension Institute respond to the usual business touchstones applied to commercial organizations? I have informed you that the president of the Institute, who is also chief stockholder, has served without salary since he was elected to that office some twelve years ago Not only has he served without salary, but for ten years no dividends were paid on the stock of the Institute Therefore the time devoted to its organization and the money invested in it returned nothing at all and represented a serious loss through the business waste of time and earning power and the failure of a fairly large investment to return anything at all in the way of interest

After ten years of operation, the Institute, through its wide publicity, was able to earn, intermittently, dividends on its preferred stock It has been repeatedly explained to the profession and to the public that for every dollar paid on the common stock two dollars must be paid to a board of trustees—composed of Mr de Forest, Dr Emerson, and Professor Fisher—to be used for philanthropic health work This provision

most strongly that all information derived from the examination of these policyholders is held as strictly confidential at the office of the Institute Any reports to the contrary are utterly false The Institute does not reveal to any insurance company the facts derived from these examinations No insurance company has any financial interest in the Institute or any voice in its management.

The Institute now serves about forty insurance companies, and the privilege of this free examination extended by these companies covers about seven million lives This is what carries our work all over the United States and Canada In this service we are now examining more than 100,000 people annually The mortality in these groups has been reduced 18 to 23 per cent as compared to the expected death rate.

In our individual service, which is more intensive and is graded according to its scope, we serve about 15,000 people annually In our industrial service, which is extended to employees of industrial and commercial concerns, we examine about 10,000 people annually

It will be observed that our work in the individual field is comparatively small It is not the huge menace that haunts the dreams of some nervous physicians in this city As a matter of fact, our private work is of great significance to the medical profession It is chiefly among fairly well-to-do people who are ready and anxious to seek the right kind of medical aid that will place them in the best possible condition

This covers the main points at issue as I see them, but if any member of this society is not satisfied either as to the verity of this statement or as to the interpretation of the facts I have presented, and he desires any further information regarding the operation of the Institute, he is welcome to call It would be a real pleasure to show him through our various departments and let him judge for himself

---

THE STANDPOINT OF THE PROFESSION

By CHARLES GORDON HEYD, M D., NEW YORK, N Y

ORGANIZED medicine is concerned primarily with the well being and health of the community The keystone of this whole question is what is best for the sick individual The doctors' economic position is associated with that idea only in quite a secondary capacity But whatever improves medical practice, whether it be for the individual or for the benefit of the general community, improves the social order, and an improvement in the social order as the result of medical services invariably improves the financial status of the doctor There can be no question that there is a very definite economic problem before us It is not, however, a problem of medical politics It is economic, not political, and the situation should be canvassed without emotionalism or passion

It would seem unwise to believe that the present trend of medicine is anything different than an evolutionary process It would also be absurd to look upon the practice of medicine as a static profession and one not capable of growth The tendency of medicine today is dynamic, and it should be the policy of the County Medical Society to direct, to control, and to influence the forces working upon medicine, rather than to deny their existence

Everyone must recognize that the profession of medicine has lost prestige, and that at the present time organized medicine speaks with no commanding or authoritative voice in public affairs The regular medical profession of today is imperilled by the encroachment of lay organizations and lay control of medical matters as is indicated by —(a) an increasing establishment of cults, (b) the extension of insurance companies wherein doctors are fulfilling the functions of paid medical technicians, (c) lay organizations practicing medicine, (d) the idea that Centers are the solution of our medical problems, (e) commercialism, exorbitant fees, fee splitting and bad medical practice, (f) the fact that organized medicine has in the beginning opposed almost every step taken in the field of preventive medicine and public health propaganda

Medicine originally was a personal contact in which the doctor comprehended all of the available information of his time, and his visit, consultation and examination, with the elementary laboratory work that was then carried out, represented a completed transaction Into this contact there intruded other collateral matters, such as the social position of the patient, and the fact that the doctor was many times an adviser in social, ethical, and religious matters He was tried by a thousand secrets, and represented the final voice in the internal administration of many homes

With the development of the technical side of medicine and the huge array of diagnostic procedures that depended upon the labor of others, there was developed in medicine as in any industry, a marked *division of labor* The result of this was an increase in the precision and effectiveness of the physician It also became more expensive Subsidiary doctors and

by the Institute where conditions were disclosed requiring medical supervision, follow-up, or treatment

"Submit this report to your physician and ask him to consider and follow up the defects and disabilities noted"

Dr Stetten, in his presidential address, stated that "The Life Extension Institute may be a purely commercial proposition, which advertises and is competing unfairly with the practicing physician, and which is making cursory examinations and rendering undependable service to the public"

I interpret that as simply recognizing a question that has been raised, rather than a charge against the Institute However, I have heard such reports and I have found that they usually emanate from people who know nothing at all about the personnel of the Institute or its equipment

First, as to equipment We have invested in our Head Office equipment about $128,000—$100,000 for medical equipment

Second, as to personnel We have at the Head Office of the Institute a staff of forty-two whole-time and part-time physicians We have been told that we employ inexperienced young men at the Institute Of course "young" is a relative term There are eight physicians—three women and five men—on the Head Office Staff between the ages of 28 and 30 There are some very "young" physicians much older than this on the staff, the average age being 35 There is no justification for the assertion that we employ inexperienced young physicians, and anyone who circulates a statement of this kind without seeking some information as to the actual facts is, in my opinion, guilty of a gross breach of medical ethics There is nothing in medical ethics worth having that is not grounded in human ethics, and one of the first principles in human ethics is to tell the truth and not to circulate false statements about one's neighbor, especially when one's neighbor happens to be a fellow member of this society

As our examinations are conducted a man is ushered into a well-equipped room, is stripped to the skin, and examined by a well-trained physician, with the privilege of consultation with other experienced men regarding doubtful points The results of his examination are considered by a highly trained reviewing board who have behind them the collective experience of fifteen years in the examination of nearly a million people, as well as the usual scientific data available to such a board What probability is there of "cursory examinations" or "undependable" reports being given to those who patronize such an institution?

Whatever weaknesses there may be in such a system, inasmuch as those with any apparent disability are urged to go to the treating profession, it lies entirely in the hands of the treating profession, the clinical group, to discover what they can beyond the facts elicited in our service, and finally determine the individual's needs and correct his disabilities

As to unfair competition with the general practitioner—as a matter of fact, the influence of the Institute's work is exactly the reverse. I am not here to claim that the existence of the Life Extension Institute is justified merely because it increases the income of physicians Unless that increased income brings increased health and longevity to the people served, this would be contrary to the public interest, and anything that is contrary to the public interest is not fundamentally in the interest of the medical profession, whatever might be the immediate financial advantage

I have an interesting exhibit along this line in the case of an insurance policyholder who recently was reexamined at the Institute This policyholder stated

"It may be of interest to you to know that the result of my Life Extension Institute examination in January, 1927, has benefited the medical profession—9 M D's, $517, 2 dentists, $132, laboratory service, $70, drugs, $20 (much of this at reduced rates)"

The Institute received $5 for the service rendered This is not an exception but a common experience Our records show that 50 per cent of the disabilities found on the first examination have been cleared up by the time of the third examination This could only be possible through the cooperation of the clinical profession Inasmuch as approximately 100,000 people were advised, in 1928, to seek medical treatment, you can figure for yourselves what that means to the medical profession

One fertile source of misunderstanding between the profession and the Institute is the failure on the part of the profession to recognize that this preclinical service is a *preliminary* service We do not make final diagnoses nor do we administer treatment. We open up the problems of the individual and urge him to go to his own doctor or some doctor of his own choice, who assumes the responsibility of final diagnosis—who follows up, perhaps, the trail disclosed by the Institute, and sometimes finds new trails—and assumes the responsibility for final reparative treatment. A full realization of this fact would dissolve into thin air most of the professional criticism brought against us

It should be explained that our work lies in three fields First and most important is the life insurance field We do not examine people who are applying for insurance, but life insurance companies arrange with the Institute to render these periodic health examinations to their policyholders, the company paying us a fee for this service. Right here I wish to emphasize

this time it is a limousine, with a chauffeur, perhaps a footman, there emerges from this limousine the doctor, his nurse, his pathologist The trinity of talent enters the sick room, the doctor has his five senses, less clinical intuition, the stethoscope perhaps, the nurse has the thermometer, the pathologist surely the empty bottle, the picture is approximately the same, even the sixty horsepower is present, but it is in the limousine

Endowed and organized charities can obtain statistical data on the treatment and prevention of disease They can provide excellent physical surroundings for the practice of medicine in institutions They can modify the environment of the individual doctors of the community They can provide means for hospital and private home medical service, but they cannot either by that wealth or their organization supplant the individual, personal contact of physician and patient This intimate personal contact must remain the foundation of the health of the individual, and basically it demands an economic consideration The failure of foundations to recognize the economic background, or to pass lightly over the economic position of the doctor in applying medical charity does not make for the best in social betterment.

The publicity of the Medical Center was founded upon a meritricious misconception It made invidious distinctions, it extolled problematic virtues, and made suggestive discrimination by prefacing much of its advertising copy in such a way as for the casual reader to assume that the Medical Center had a monopoly on brains, talent, and equipment The Medical Center does not need to do this It has the respect, the cooperation, and the good wishes of organized medicine It is embarking upon a career of the most splendid altruism in medicine In return for this dower from organized medicine it should treat the profession with candor and fairness, because both parties must live in harmony in the same social environment.

In regard to the Cornell Clinic, it is our conviction that the Cornell Clinic is not "playing the game" fairly The Clinic charges an average fee of $2 41 per visit per patient according to its report of 1927 At times the charges for diagnosis amount to $40 00 Charging such fees is against the spirit of the present dispensary law which was passed for the aid of the indigent poor Less than 20 per cent of the work of the Clinic is diagnostic, many of the patients presenting themselves without medical reference and often without the need of a diagnostic study

As an endowed tax-exempt institution the Clinic enters into unfair competion with the practitioner Its clientele consists of persons of moderate means from whom the average physician's income is derived The motive of the college is to teach young men to practice among that very class with which the institution competes Certainly, for the first ten years of their practice this is true of their graduates The conclusion is that this Clinic organized for the purpose of providing teaching material for the Medical Department of Cornell University is in fact engaging in the practice of medicine, 20 per cent of its work being diagnostic, and over 60 per cent is devoted to the routine treatment of patients

We credit the Life Extension Institute for being the great exponent of periodic health examination We believe that the report of the Subcommittee investigating the Life Extension Institute is sound and that its judgment can be concurred in by all reasonable men

The Life Extension Institute and the Cornell Clinic carry no burden in regard to medical treatment for the sick and poor of the City That burden still is carried by the Hospitals on the one hand and by the unpaid practitioners on the other hand

The advertising by the Life Extension Institute is misleading The adjectives it employs in describing its service are discriminatory Its suggestions as embodied in its copy are not in consonance with the high talents of medicine For example, "for those desiring a most complete examination the Institute has arranged—unlimited examination—most comprehensive—searching examination" "An impartial report is rendered—the subscriber then knows his needs and can make his own decision" Is the patient qualified to interpret his needs? Can the Institute honestly believe that a patient knows his needs? Again, "for those who do not desire such an extensive examination—a service known as the Standard Examination" There are apparently two types of examination, an unlimited examination, "most comprehensive" and "searching", and another examination not so extensive, not so searching, the division into these two groups being based upon the ability or the willingness of the patient to pay for them This, I take it, is an example of fundamentally bad diagnostic policy

The Bellevue-Yorkville Health Demonstration represents the greatest opportunity in the City of New York for the cooperation and coordination of charitable endeavor and medical attention It stands alone as the most fruitful field for team work between organized medicine and organized charity

My own personal leanings are away from great emporia of medical practice, they are rather for the establishment of community or regional hospitals, dedicated to the care of the sick and alleviation of human suffering, where a patient can be treated and not discharged

laboratories were dependent upon the physician for their work, and he in turn was beholden to them for reports on certain special work This entailed a multiplicity of functions and took away from the doctor that full medical intelligence wherein he previously did all of the professional diagnostic procedures There came the building of large hospitals, the great development of health departments, the ever-increasing extension of health demonstrations, the creating of independent clinics, and the enlarging of the dispensary clientele Add to all these the huge sums of money, controlled and managed by foundations, which are available for public health work, for diagnosis, for treatment, and one must conclude that the role of organized medicine occupies quite a secondary position Moreover, commercial enterprises, professional or otherwise, grouped under the head of an outstanding personality or ranged under a corporation title, and run primarily for dividends or as an eleemosynary project, have developed and invaded the medical field

As a corollary to the division of labor in medical practice came *specialism* The development of specialism was undoubtedly accelerated by the increased remuneration that was possible to the doctor becoming a specialist, but it was not primarily responsible for it. Specialism was as natural a result of the division of labor in medicine as was specialism in industry The cost of a diagnosis is high because so many specialists must contribute to the final opinion To lessen this mounting expense and to keep the cost within the available means of the patient, *medical grouping* in some form was necessary and was the logical result Hospitals and clinics with all departments under one roof combined the feature of division of labor with a minimum cost in collecting all the necessary clinical information In short, it appears to be almost a physical impossibility for any practitioner to supply the needed data without devising a rather large plant of his own, or without allying himself in some measure with a diagnostic group

However, all of the patients do not need such an extensive study as now seems to be advertised Eighty per cent of the patients that come to the doctor's office are capable of receiving an opinion that is correct, and that indicates the proper therapy, without the most extensive and elaborate study of their entire body Foundations and pay clinics, to increase their admissions, have advertised a series of laboratory studies, which in the majority of cases is neither necessary nor indicated

The effect of medical centers, of pay clinics, of life insurance propaganda, of health department propaganda, of school propaganda, *is to give everybody a medical thought about themselves* The more people are interested in being fit and well, and the more people are thinking about their health in terms of longevity, the more medical practice there is to be distributed among the sum total of doctors in any community The more people can be encouraged to have periodic health examinations, the greater will be the number of diseased conditions that will be uncovered, all of which will necessitate medical care and treatment

The big institutions, the pay clinics, the hospitals, and the foundations have invaded a social class that heretofore have paid their family doctor for medical services, with the result that free service is given to an economic group that should pay for their medical service. The establishment of pay clinics and diagnostic clinics, in connection with medical schools and hospitals, have all restricted the field of the general practitioner

Medicine and medical institutions alike stand at the sharp division between two merging types of civilization,—an old system built up by individual contributions, and a new system made up of the contributions by organized efforts Medicine must take its choice and become a dynamic and integrating force for public well being and leadership in human affairs

There are certain features of the four units discussed this evening that are peculair to each one of them, and there are certain features that are common to all of them They all stand at the crossroads of medical progress and social betterment. They have tremendous responsibilities

The organization of medical centers, pay clinics, etc is complete and well nigh perfect. Owing to their almost illimitable financial resources they are able to purchase the most complete and up to date equipment, to surround their services with the armamentaria that apparently is necessary for a complete diagnostic workshop This means, in a large measure, a constant mounting cost for medical services The individual practitioner cannot compete with the centers in bricks or mortar, in doormen, in nursing force, in all the external equipment that goes with modern institutional practice The only thing that he can compete with is in the quality of his brains A fair and accurate comparison of the men associated with the big medical centers and the physician of equal mark on the outside will show that the physicians attached to these institutions represent no huge superiority in brain talent

A few years ago the physician drove up to the private house, he got out of a rather indifferent automobile, he entered the sick room, he carried a stethoscope, a thermometer and an empty bottle for the specimen, he had his five senses, plus a professional intuition, and a sixty horsepower brain

To-day, another type of physician drives up

14 The establishment of a Committee on Public Relations with representatives from all medical societies under the sponsorship of the County Medical Society, wherein the best constructive thought, economic, legislative, and medical, could be expressed for the general good of all the citizens of the State of New York

Organized medicine believes that the time was never so opportune for real, conscientious, sincere work upon the part of the individual practitioner as at the present time I am for the individual practitioner, but only when he becomes constructively articulate through duly authorized leadership Never has the demand been so insistent for medical leadership and medical statesmanship, backed by a solid organization of medical men as at the present time With our knowledge and experience, a reasonable objective can be reached and a noble purpose adequately and honorably accomplished

---

THE EFFECT OF THE PUBLIC HEALTH PROGRAMME UPON THE INTERESTS OF THE PRIVATE PHYSICIAN*

By JAMES ALEXANDER MILLER, M D, NEW YORK, N Y

Outline

The economics of medical practice balanced against community medical service

1 Community conditions discussed pro and con —
- Dispensaries and Hospitals
- Departments of Health
- Workmen's Compensation
- Industrial Medicine
- Life Extension Institute
- Health Demonstrations
- State Medicine

2 The Physician himself
- The decreased amount of sickness, balanced against unoccupied fields of practice
- Indifference, or preoccupation of the physician
- A broadening of medical interests, and an adaptation to new conditions

---

Controversy has thrown the economic interests of the physician into the foreground of this question In professional circles such discussion may seem unfortunate, but as it has been forced into the open, it must be frankly faced

There are, however, other broader and less material phases of this problem as it affects medical interests which we will later take the opportunity to discuss also

Economic Interests

Although the evidence is conflicting, it is perhaps fair to admit that with the changing conditions of modern medical practice, of which the development of preventive medicine forms an important part, the financial return to individual practitioners has probably diminished in not a few instances

If this represents merely a temporary period of readjustment to a situation which is essentially sound and beneficial to the community as a whole, it is not a matter of serious concern Similar instances in other phases of economic life are common enough in the rapid development of modern conditions

If, on the other hand, the conditions imposed are unfair and unjust to a group so essentially important in a public health program as is the medical profession, then the community should not only be interested but disturbed

Charges of such unfairness and injustice have been frequently made. Let us examine them

The rapid extension of the dispensary and hospital facilities has been a great boon to the poor It is charged that they are abused because of their frequent use by those well able to pay private physicians, thus depriving practitioners of legitimate sources of income, imposing upon the generosity of the public and private benefactors, and, moreover, lowering the self-respect of the beneficiaries themselves When, as not infrequenly occurs, these institutions have their facilities freely advertised in the public press with the object of attracting financial support from the public, the competition is all the more unfair because physicians as individuals, however confident they may be of their own ability, can not ethically advertise

Another grievance is the encroachment upon private practice on the part of the Department of Health It is charged that diagnostic and treatment clinics, free advice in the baby health

*An address delivered before the Advisory Council of the Milbank Fund on March 13, 1929

because "he is not sick enough to be in a hospital" Hospitals of this type for our immediate needs, erected in various parts of the City, with a local practitioner in the community having free access and in turn being controlled by the ethical and moral force of a hospital in the district,—these shall be the hospitals in the true sense of the word, and not clinical laboratories for research

Medical service is a matter of wise public policy, and like education it can be purchased We educate our children, we educate the community, we are taxed for it, and in the same way shall the rendering of medical service in our hospitals, in our public institutions be paid for on a basis of fairness and equitable remuneration I personally feel that at the present time we have laws and regulations which are sufficient if properly enforced, to eliminate 75 per cent of our medico-economic problems

The present day dispensary and hospital practice that permits a patient who is able to pay hospital expenses and then expects the attending physicians to give their services free, is ethically wrong and economically unsound Take the patient who is sent by a private physician from Connecticut, Pennsylvania or New Jersey, the patient comes to one of the recognized hospitals, pays the demanded ward rate of $4 50 per day, and is admitted into the wards of the hospital The hospital publishes a report that the maintenance rate is $5 21 a day Therefore, the benefactors of this hospital have contributed seventy-nine cents a day to carry a patient who pays no taxes to the State or City of New York In this same hospital the superintendent is paid, the cashiers are paid, the admission clerk, the cook and baker are paid, orderlies and hospital attendants are paid, the registered nurses are paid, and the doctors alone are uncompensated

Now, what load does the doctor carry in regard to this particular patient? (1) His medical expenses go on, his overhead continues, he must fortify his old age by adequate saving (2) He must carry malpractice insurance, I think it is a matter of record that members of the profession are sued more frequently by charity or ward patients than by their own private patients (3) He accepts a personal responsibility for the patient (4) The professional attendance many times involves personal disbursements in the way of taxi fares, etc

The discussion this evening would be futile if it were not possible to make certain suggestions that would make for improvement It would seem that the following are reasonable procedures, and if carried out in whole or in part, they would be of benefit to the doctor on the one hand and these institutions that are represented here this evening by those on the program

1 An aggressive and unqualified enforcement of the present dispensary laws

2 A discontinuance, in a large measure, of the treatment aspect of the Cornell Clinic. Furthermore, a sincere effort should be made by the executive officer of the Clinic to prevent the attendants from obtaining operative or medical material for their private practice

3 The consideration of the desirability of a central registration bureau that will list all dispensary patients applying for free service upon their claim that they are truly dispensary patients, thereby preventing reduplication and dispensary shopping

4 The limitation of dispensary facilities, except in the cases of emergencies or communicable diseases, or cases used for teaching in medical schools, to a more or less geographical area

5 To consider patients coming from outside of Greater New York, unless emergency cases, or cases with communicable diseases already in the City, as essentially pay dispensary patients, and to allow the attending physicians or surgeons to charge for services rendered

6 The elimination of treatment clinics by the Board of Health and its agencies, except those devoted to the treatment of addicts and communicable diseases

7 A consideration of the desirability of establishing regional or district hospitals, fully manned with a staff from the physicians in the neighborhood

8 A graduated scale of remuneration for all doctors working in dispensaries, and possibly the application of the same principle for attending physicians and surgeons in hospital service

9 A request that the Medical Centers and Institutes engaged in public health work avoid discriminatory advertising whereby the prestige and medical position of the practitioner is depreciated in the public's mind

10 The doctors engaged in public health demonstrations or in periodic health examinations to be paid a fair remuneration by the organizations conducting them

11 A consideration by the County Medical Society of the listing of all laboratories and every laboratory agency, for the purpose of permitting an individual practitioner to benefit by using a diagnostic group

12 To suggest ways and means whereby hospitals may make their services available to all ethical practitioners in their regional area

13 To increase the means for publicity and education, utilizing all ethical avenues for this purpose as a definite object for rendering service to the public

14 The establishment of a Committee on Public Relations with representatives from all medical societies under the sponsorship of the County Medical Society, wherein the best constructive thought, economic, legislative, and medical, could be expressed for the general good of all the citizens of the State of New York

Organized medicine believes that the time was never so opportune for real, conscientious, sincere work upon the part of the individual practitioner as at the present time I am for the individual practitioner, but only when he becomes constructively articulate through duly authorized leadership Never has the demand been so insistent for medical leadership and medical statesmanship, backed by a solid organization of medical men as at the present time With our knowledge and experience, a reasonable objective can be reached and a noble purpose adequately and honorably accomplished

THE EFFECT OF THE PUBLIC HEALTH PROGRAMME UPON THE INTERESTS OF THE PRIVATE PHYSICIAN*

By JAMES ALEXANDER MILLER, M D, NEW YORK, N Y

Outline

The economics of medical practice balanced against community medical service

1 Community conditions discussed pro and con —
- Dispensaries and Hospitals
- Departments of Health
- Workmen's Compensation
- Industrial Medicine
- Life Extension Institute
- Health Demonstrations
- State Medicine

2 The Physician himself
- The decreased amount of sickness, balanced against unoccupied fields of practice.
- Indifference, or preoccupation of the physician
- A broadening of medical interests, and an adaptation to new conditions

---

Controversy has thrown the economic interests of the physician into the foreground of this question In professional circles such discussion may seem unfortunate, but as it has been forced into the open, it must be frankly faced

There are, however, other broader and less material phases of this problem as it affects medical interests which we will later take the opportunity to discuss also

Economic Interests

Although the evidence is conflicting, it is perhaps fair to admit that with the changing conditions of modern medical practice, of which the development of preventive medicine forms an important part, the financial return to individual practitioners has probably diminished in not a few instances

If this represents merely a temporary period of readjustment to a situation which is essentially sound and beneficial to the community as a whole, it is not a matter of serious concern Similar instances in other phases of economic life are common enough in the rapid development of modern conditions

If, on the other hand, the conditions imposed are unfair and unjust to a group so essentially important in a public health program as is the medical profession, then the community should not only be interested but disturbed

Charges of such unfairness and injustice have been frequently made Let us examine them

The rapid extension of the dispensary and hospital facilities has been a great boon to the poor It is charged that they are abused because of their frequent use by those well able to pay private physicians, thus depriving practitioners of legitimate sources of income, imposing upon the generosity of the public and private benefactors, and, moreover, lowering the self-respect of the beneficiaries themselves When, as not infrequenly occurs, these institutions have their facilities freely advertised in the public press with the object of attracting financial support from the public, the competition is all the more unfair because physicians as individuals, however confident they may be of their own ability, can not ethically advertise

Another grievance is the encroachment upon private practice on the part of the Department of Health It is charged that diagnostic and treatment clinics, free advice in the baby health

*An address delivered before the Advisory Council of the Milbank Fund on March 13 1929

stations, free vaccination for smallpox and diphtheria, and free administration of antitoxin, are indiscriminately given, quite independent of the economic position of the patient and to the detriment of the general practitioner

Also, the operation of the Workman's Compensation laws is said to lead to the control of the medical and surgical care of these cases by the representatives of the insurance carriers, thus unfavorably affecting the general practitioners and tending to emphasize the interests of insurance companies rather than those of patients

The establishment of medical departments by many business and industrial concerns is also decried as again working against the interest of the patients in favor of the employer, as well as interfering with the practice of the family physician

The Life Extension Institute, the original organized effort to promote periodic health examinations, comes in for a particularly full measure of criticism on the ground that it is essentially a corporation practising medicine contrary to the spirit of the law, and that it has taken advantage of its opportunities for public advertising

Criticism of health demonstrations has become especially popular of late The Physicians Progressive League inveighs violently against "the socialization and industrialization of medicine at the hands of philanthropists and social reformers" The prestige of the medical profession is threatened Social workers are said to have usurped medical leadership and public health nurses by direct or implied criticisms have undermined the position of local practitioners Also, the fact that outside medical talent has been imported into the demonstration areas has been resented and that any demonstration at all is needed, implies that the physicians have been remiss in their duties Moreover, statistics are said to be juggled and widely broadcast so as to create a false impression as to how important and efficient the demonstration has been

Behind much of all of this dissatisfaction and resentment is the vague bugaboo of the danger of State Medicine I have never seen this term accurately defined, but in general I believe it to mean the organization and control of the practice of medicine into various groups operated by salaried physicians more or less dependent upon political or corporate interests, thus tending to deprive the practice of medicine of its essential individualistic characteristics and to degrade the practitioner from an independent entity to a time-serving hireling Examples of this tendency in medicine have already been indicated in the operation of modern industrial medicine and the Workman's Compensation Laws, and the extension of similar methods through State insurance, with ultimate political control, is feared

Now, all of the above activities are concrete examples of tendencies in modern medicine which many physicians decry The criticisms are important enough to deserve serious consideration They should not be lightly dismissed as simply the outcry of acquisitive individuals thwarted in their money-making designs, for these ideas are really seriously held by a considerable number of reputable physicians It is worth while to inquire why

The truth is that the life of a large proportion of practising physicians is very hard and very poorly compensated, especially when compared with the increased compensation accruing to other groups in the community and considered in the light of the increased cost of living If one excepts specialists, medical fees for general practitioners have not by any means increased in proportion to the increased cost of living

Modern medicine has eliminated or markedly diminished many diseases which used to support a large number of physicians, and as the more serious surgical and medical cases are more generally treated in hospitals out of the hands of the family physicians, their income correspondingly diminishes Now, the advantage to the community of this diminution of disease and increased hospital care is so obvious that one never hears any open complaint on this score from the physician, but the actual effect upon medical income is very real, nevertheless

Another factor is the better education in health measures on the part of the general public which has now made the intelligent mother the prescriber for multitudes of minor complaints in the family which a beneficient nature cures and the doctor is never called upon to see

In addition, the doctor is notoriously the last to be paid when illness makes circumstances difficult Fifteen to twenty per cent of unpaid accounts is the rule rather than the exception with most physicians Numerous examples to the contrary notwithstanding, the usual physician gives very largely and freely of his services when compensation is a hardship The additional burden of unacknowledged and often unwarranted charity implied in these unpaid medical accounts is a real imposition

In a Cape Cod cottage one summer I came across a couplet which tickled my fancy and is quaintly apt to the point under discussion. It runs as follows

"God and the doctor we alike adore,
In time of trouble, not before
The danger past, both are alike requited,
God is forgotten and the doctor slighted"

I have recited these actual conditions of modern medical life in order to show that if in addition to these basic conditions which are difficult in themselves, other factors enter in, which either actually or apparently in the minds of the physicians unfairly discriminate against them, the stage is set for discontent among a class whose struggle for existence, let alone a competence, is a very real one

In common fairness, therefore, we should make sure that in the operation of these activities which are intended for the common good, the legitimate and proper interests of the physician are safeguarded Let us go back over them briefly from this point of view

In dispensaries the law provides for the exclusion of all of those able to pay ordinary medical fees, but it is well known that there exists no adequate machinery to enforce this law In so-called pay clinics the fee for diagnosis appears entirely justified in order to provide expert and specialist advice to a group economically above the very poor, at rates within their means, but restrictions upon the activities of such clinics in the field of treatment appear to be justified

In hospitals no laws in this state provide for the exclusion of patients on account of their financial status, and no patient willing to go into a public ward is excluded on economic grounds alone. In justice to the community and the patient, as well as to the physician, better regulation of this situation in dispensaries and hospitals is desirable, although the amount of abuse of these institutions is probably exaggerated and there is little doubt that patients in general would prefer private treatment at a reasonable expense, provided they were assured the treatment afforded was comparably good, as unfortunately is not always the case.

As to Health Department activities, the official responsibility for the prevention of disease rests here, and the authorities undoubtedly have a legal right to employ any measures to attain that end In most communities there is no desire to undertake work which properly belongs to the private physician, on account of the expense involved, if for no other reason Encroachments when they occur are usually due to the lack of co-operation of the private physicians who are all too prone to overlook the importance of preventive measures Forward-looking health commissioners, however, recognize that the ideal program calls for continued efforts to enlist the medical profession in this work, rather than too impatiently set up an organization at public expense to perform the duties which physicians are slow to recognize It seems clear, however, that health department clinics should have little or nothing to do with treatment and that other preventive measures should aim to guide and supplement medical practice rather than to supplant it

In the operation of the Workman's Compensation Act much is to be said for the criticism leveled at the control of treatment by physicians identified with insurance companies To be sure, it is to the interest of these companies to get the patient well as fast as possible, but undoubtedly there often exists a bias in favor of the companies in the medical testimony laid before the commissioner which may operate against the interests of the beneficiary From personal experience I can not say too much in praise of the sympathetic and statesmanlike conduct of the commissioners in these cases, but the questions are often technically difficult, and the issues confused by conflict of medical testimony,—that for the beneficiary often being quite as biased as that of the representatives of the companies,—so that wise decision is often very difficult. It would appear that this problem is closely related to the broader one of expert medical testimony and that some method of advising the courts on medical matters in an unbiased manner should be devised

To a certain extent a similar problem arises in industrial medicine Full-time physicians in the employ of corporations or business concerns may not always see the patients' interests in an unbiased light, although one is impressed in general with the fact that their work is better done than that by the general run of private practitioners The danger of routine, stereotyped, hard-boiled service, however, is real, and if the system of industrial medicine is thoroughly developed in the future, one can visualize the increasing difficulties in obtaining occupation for people who are in any way physically handicapped Here, too, however, one can not but be impressed by the frequent generous attitude of employers to their sick employees who have real claim upon them

The true solution of these problems will probably be an extension of the system of mutual disability insurance in which justice to all, including the family physicians, must be assured

The case of the Life Extension Institute is extremely interesting One can not become too greatly concerned over the criticism of it as a corporation, for it is operated according to law As to its advertising, that is probably the only way in which the need and value of periodic health examinations can be gradually impressed upon the public One might criticise some of their methods, particularly the lack of the personal touch on the part of the medical officer responsible for the final report, and also the unfortunate psychological effect of placing a technical document into the hands of

the patients themselves who may, and frequently do, draw erroneous and unfortunate conclusions That the Institute, however, does great good in uncovering unsuspected diseases or defects there can be no doubt, and it is my strong impression that it increases rather than detracts from general practice, both by inculcating the habit of regular physical examination and by referring cases for treatment which would otherwise have been unrecognized

The criticism of Health Demonstrations seems to be directed against conditions which are more apparent than real They probably can only be understood when they are considered in their possible effect upon the physicians' prestige in a particular community.

It is quite probable that in some of these demonstrations the need of securing complete co-operation from the medical profession and of being very considerate of their rather touchy feelings have not been sufficiently emphasized It is quite possible also that in matters of technique the methods of conducting perfectly proper activities have not been as tactful as they might have been It is also quite true that in most instances the lack of a systematic effort to enlist the support of the medical profession in advance of the institution of the demonstration may have led to the impression that social workers have had more authority than is really the case

As to the complaints of the juggling of statistics, it is possible that there, too, over-enthusiasm has occasionally exaggerated the results obtained Not every demonstration has been fortunate enough to have a Sydenstricker at its elbow But, in general, it would seem that these reactions are not very serious provided the development of demonstrations is made slowly and that determined and persistent effort is exerted to have the physicians brought in to the demonstration work

As to State Medicine, as such, there is very little to be said because one does not note any very definite trend toward actual political control in this country

On the other hand, there is an increasing tendency for physicians to take full-time positions, whether they be for corporations or other business establishments or for insurance companies or for Health Departments or for other definite health enterprises There is a definite risk that something which is very valuable may be lost unless a determined effort is made to retain it By this I mean the sympathetic individual touch between physician and patient which has been the outstanding characteristic of private medical practice Unless this can be retained, at least to a degree, something very important both to patient and physician will be lost and the community will be the sufferer

As we go back over these various criticisms, they may appear rather petty and unimportant, but there are certain tendencies which it is important to recognize, and in the development of our programme it would really seem as though there were some injustices to the physician which might have been prevented and which in the future can be eliminated Certain it is that the general physician must be brought in as a part of any such programme, and if he is to do this or any other medical work efficiently, he must be adequately compensated

But when all is said and done it is evident to a fair-minded enquirer that these factors do not constitute the real explanation of the fact that undoubtedly for the physician trained and practising according to tradition there is less business than formerly The main fault lies with the physician himself,—his training and his lack of adaptation to changed conditions

Medical students have been and are trained to be individualists The care of the sick person is looked upon to be their chief, if not their only responsibility These students go into practice with no adequate conception of the function of the physician in the prevention of disease The opportunities for increased income which come from the application of modern preventive measures are very great and would surely more than make up for the loss which is sustained by the lack of the diseases which were common in a previous generation, but physicians are not alive to this The more general appreciation of the importance of periodic physical examinations, for example, would create a great deal of practice in itself and would uncover a great many defects and diseases otherwise undiscovered The dentists have been way ahead of the physicians in this matter No physician thinks of sending out cards to the patients on his list stating that the time has come for them to come in and be looked over again, and perhaps the public itself is not yet ready for that practice In some instances and in some localities it has been done with most gratifying effects, both to the health of the community and to the income of the physicians

The regular systematic application of preventive inoculations is uniformly ignored by physicians, and health authorities often are forced to come in and do this work themselves, simply because the physicians will not undertake it

An interest in and a knowledge of the environment of the patients having to do with the control of their habits, which is so important particularly in middle and advanced life, is often entirely neglected by physicians until disease actually presents itself

Moreover, this whole discussion of medical income puts the profession in a false position In the last analysis, one must recognize the

fact that the practice of medicine will never be a career for profit, but it should be rather one for service If this whole discussion will enlighten those who are contemplating the study of medicine to the fact that it is not a lucrative profession, it would be very helpful by keeping out of it men who are perhaps better fitted for success in commercial or other fields

There is no doubt that a great many physicians are both personally and professionally unfit for their job Bernard Shaw has defined a cad as "One who takes more out of the common pot than he is willing to put into it" I presume there is little doubt that, according to this definition, we have not a few medical cads If the hard times that they are having will lead to the diversion of their energies and those of their kind into other fields, it would be a real boon to the community

As a matter of fact, I think there is little doubt that a physician with the right personality and the proper training and honest methods in his work will ever have any difficulty in making a competent living, even though he may be slow in taking up the modern ideas of preventive medicine

In his inaugural address as President of the Academy of Medicine, Dr Hartwell has well expressed the general idea I wish to convey

"No brilliance of intellect, no accomplishment of mind, no accumulation of wealth, has ever elevated any physician to be the respected and beloved colleague of the profession or the idolized friend of his fellowmen, unless they have been associated with a devotion which places a desire to help above them all If we aggregate to ourselves the function of improving mankind individually and collectively, particularly in healthfulness, we must acknowledge that our fellow citizens have a right to demand that each one of them shall receive at our hands what is necessary that he may enjoy good health in so far as science and the art of medicine can give it."

But there are really a great many physicians who are practising medicine on a plane very much like this, but who are not particularly interested in public health programmes or preventive measures They are really the rank and file of the medical profession They are not so much indifferent as they are preoccupied with their own job, and a very real job it is For the busy practitioner, the needs of suffering humanity that are insistently coming to him make oftentimes the demand for practising preventive medicine seem much less important and certainly less interesting

I am not sure we are yet in a position intelligently to criticise this great body of physicians When we come to be sick, as, with all our passion for preventive medicine, we surely will be, or when we come to die, as surely we must, I am not sure we shall not be very happy to have by our side the skilled sympathetic physician who helps us because his life has been constantly devoted to helping the sick, in distinction from the well, and I am not sure that at that time we shall be inclined to ask how systematically that physician has given toxin-antitoxin to the children in his family practice, or to regret that he has not spent a goodly portion of his day at committee meetings discussing abstract policies of public health

In other words, we have a great need for a body of physicians of this type, and there always will be that need, and not every physician who is a successful skillful practitioner is capable of taking a commanding interest in preventive health measures

But on the other hand, we see astonishing exceptions stepping out from the mass These, too, are busy physicians, successful and skillful, but at the same time realizing that there is a broader field for medicine It is to them that we must look as a connecting link between the organized public health movement and the medical profession as a whole, for they are the real leaders in the profession and in time will be successful in moulding medical sentiment in the direction of wider spheres of usefulness

This leads us to a consideration of some of these broader interests as opposed to the more sordid economic interests that we have heretofore had under discussion

Broader Medical Interests

It does not take a physician, for any intelligent layman trained to a social outlook on life can see that preventive medicine is opening up the doors of opportunity to the medical profession, which it is as yet very slow to see

The whole horizon of medicine is enormously widened as soon as one looks behind the individual case itself to the conditions of life which surround it and which so often are operative in its causation From a consideration of mere physical signs and symptoms one can look behind to the family life, the industrial burdens and the community problems, which are so inextricably woven into the fabric of many diseases To treat these diseases as well as to prevent them, the physician must know more than simply the physiological and pathological conditions in the body We physicians in the past have been intensely self-centered, deeply interested in our own job, indeed, fascinated by it, so that we have not recognized as we should the points of contact which these very interesting diseases themselves have with the outside world For this reason, physicians as a class have held aloof from active participation in civic affairs Students, scientists and clinicians we must continue to be, but the call of

the future is for wider application of our special knowledge, expressed in public efforts on behalf of the common good

In the past our profession has commanded the devotion, enthusiasm and self-sacrific of its members, but its viewpoint has been more or less narrow The achievements of preventive medicine are not only tending to revolutionize our practice, but, better still, it has thrown open the gate of opportunity and responsibility for active participation in all the social and economic problems which are pressing for solution all over the world

It is my belief that the memorable traditions of our profession guarantee that it will not fail to grasp these developing opportunities, in fact, we are already beginning to see very definite evidence of such a change

In a memorable address on the occasion of his inauguaration as President of the New York County Medical Society, Dr DeWitt Stettin concludes as follows

"We pledge our unqualified support to any movement in the interest of public health and general welfare of the community We are convinced that in the long run such a movement will always react toward improving both the social and economic status of the physicians in that community, just as contrarywise we feel that any movement which is inimical to the profession is harmful to the public Much more vital than this, however, is the fact that, after all, prevention of disease as well as the cure of the patient is the basic idea and ultimate ideal of our calling and therefore the primary responsibility of our County Society"

It is not without significance that these words and those previously quoted from Dr Hartwell's address come not only from the presidents of the two most prominent medical organizations in New York City, but in both instances they come from surgeons Surely, if the surgeon, the most obvious exponent of the concrete job in the practice of medicine, is becoming the ardent proponent of social and preventive medicine, there is every reason for hope for the profession as a whole The ideals of such far-sighted leaders in medicine are bound to prevail but we must be patient as the profession gradually adapts itself to changing conditions and through education and experience after a time comes wholeheartedly into the public health movement

It is surely true that we can not do without the physicians Their training makes them the logical backbone of a public health programme. As we have already indicated, the leaven in this direction is already working from within the profession itself

Let us recognize and encourage this fact, rather than condemn the profession as a whole because of the attitude of the more loudly articulate minority

The result to be obtained is worth waiting for, for, after all, they are a good lot, these doctors, not to be impatiently pushed aside because they do not immediately come in enthusiastically with us as we move forward toward our goal of a healthier and happier world Let us, rather, be sympathetic and understanding toward them in their problems, and mayhap, who knows, when they do come in they may be all the more sure of their footing, more sound in their judgment and more helpful in their endeavor, by reason of the longer and slower way by which they have traveled

---

CONTROL OF CONCEPTION, PRESENT AND FUTURE*

By ROBERT L DICKINSON, M D, F A C S, NEW YORK, N Y

MY TEXT is a quotation from a student of population who once ran the largest of the world's pediatric clinics, and who is soon to become President of the United States As part of the "Child's Bill of Rights," he specifies that "There should be no child in America," first, "that has not the complete birthright of a sound mind in a sound body," and second, "that has not been born under proper conditions"

Toward carrying forward such a program, our business of the afternoon is the consideration of medical problems in the technique of human reproduction—the needs, efficacy, and after-effects of birth control methods

Size of the Birth Control Problem—Any health question calls for presentation under conspicuous medical auspices when it involves frequent decisions by a considerable part of the population, and when it influences the well-being of the body, the peace of mind, and the future physique of the race How large a proportion of our adults are affected? Nearly one-fourth. How frequently must a decision be made to procreate or not to procreate? About twice a week (3) There were in the United States in 1925 some ten million couples with both partners fertile, the wife neither pregnant nor

*Address delivered at Academy of Medicine, February 15 1929 The full text appears in the Bulletin of the Academy of Medicine of May, 1929, of which reprints will be available.

nursing, who constituted 62 per cent of all the married couples These twenty million persons represent one to every 4 3 individuals over 21 years of age (5) As to frequency, nearly two thousand case reports show coitus to be even oftener than twice a week among agriculturists (8) and the city poor (2)

New Urgency of the Problem—Of old, famine, pestilence and war, bad hygiene, and reckless feeding of infants wiped out surplus population We are interfering with these grim regulators, and doctors must face the results of interference with smallpox and plague and sepsis and their allies China and India complain that we have made their starvation problem worse England has a million unemployed, and industrialism can no longer take up the excess Japan and Italy breed a half million surplus babies each year, yet have not the coal and iron that altered Malthus' predictions The earliest device, infanticide, is no longer a way out Abortion we protest against We do not agree with Luther who, when told that incessant breeding killed women, retorted, "Let them die, that is what they are for" The Germany of twenty years ago could breed deliberately for conquest, but when Mussolini teaches the same doctrine today, the nations look askance As to situations in New York I shall defer these to the end of the hour

The Constructive Work of Birth Control—While striving to limit the propagation of mental defectives and others grossly unfit, and guarding mothers from dangerous or excessive childbearing, we physicians would be grievously remiss if we failed to follow the recommendation of the most impressive of the birth control conferences, the one held in New York in 1925 (9), that "persons whose progeny gives promise of being of decided value to the community should be encouraged to bear as large families as they feasibly can" We will protest against extravagance and selfishness that refuse childbearing We will urge decent salaries for missionaries, ministers and teachers, since it is their children that take the lead in *Who's Who* We will collaborate with church and school and college, and the American Social Hygiene Association in exalting marriage and monogamy, and in honoring honorable acts of love We will seek opportunities to do our part, as medical societies and as practitioners and specialists, in sex education of the young In other words, instead of *sidestepping*, we will share and lead

Action by the Profession—What action on this health question has the profession taken? It is only a hundred years since France began to restrict her birthrate, and a little more since Francis Place distributed tracts in England It is eighty-five years since Dr Knowlton's practical treatise was written in America, which was the cause of awakening England fifty years ago, and seventy-five since Dr Drysdale printed in London the first well-rounded presentation of the subject Fifty years ago Holland started contraception It is forty-eight years since, in our own state, the doctor who desires to postpone pregnancy to save lives obtained a statutory right to do so But this right had to be confirmed for him by a court decision after the prison term of a certain dignified, auburn-haired nurse, and her name was Margaret Sanger

Is this hundred years, or even fifty years, too soon to expect some organized medical society or public health body to investigate this problem?

Up to date, medical official action has taken this form The New York Obstetrical Society's questionnaire gave a vote for investigation of birth control in 1923 The New York Academy of Medicine approved a program of study in 1924 The American Gynecological Society in 1924 voted for cooperation in the study and in 1925 recommended changes in the law that would allow medical books and scientific journals containing birth control technique to be mailed

The Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association in 1925 passed a resolution recommending changes in the law wherever necessary to allow control of conception by the physician This was revived two years later, but was pigeonholed, although in Pennsylvania, Connecticut, and eight other states, the law expressly forbids physicians to give contraceptive advice One doctor in every eight in the country has written to the American Birth Control League for information, nearly two hundred county medical societies, covering every state, have asked for talks on birth control by its medical director, and the attendance, like this one, breaks the records Nine leading hospitals in Greater New York formally include birth-control advice in their outpatient service, and out-patient clinics for birth control are in nine other places

After the refusal of several medical bodies and public welfare organizations to study contraception, a self-constituted body, the Committee on Maternal Health, was organized under full medical control six years ago I am its Secretary, a volunteer worker on a nine-hour day, with five secretaries The Committee has three rooms in the Academy, but has no organic relation to it One of our first acts was a report on the medical situation, including the technique of contraception (4) I mailed 1,500 reprints on the day that the journal which contained this article was posted, and another 1,500 have been mailed since The Federal Law fathered by Comstock had, since 1873,

forbidden medical knowledge of this kind to be sent by post even to doctors Mine was the first extensive test of the attitude of the Post Office Since then, Dr Hannah Stone's able report on 1,465 well followed-up cases from the American Birth Control League (10) has been published in a medical journal and mailed as reprints, and Dr James M Cooper's large book, "The Technique of Contraception," (2) has gone out to 10,000 doctors Vaginal diaphragms are expressed without hindrance We may, therefore, infer that public opinion is such that interference with the necessary dissemination of medical knowledge or supplies will not be countenanced

Dangers and Objections—Free access to information and contraceptive materials will, it is said, foster widespread promiscuity in the unmarried and the married, favor gross sensuality in the married, and even safeguard sexual intercourse as a mere love relation between husband and wife Contraceptive practices will induce local inflammations—some say deadly ones, result in sterility if resorted to early in marriage, and increase childless marriages Furthermore, there is the fear that such knowledge will be put into practice only by the intelligent, and thus this class will become overwhelmed by the progeny of the reckless and incompetent Finally, the nation will stand naked to its enemies

Promiscuity—A sure contraceptive obtainable anywhere would indeed remove risk or fear of pregnancy, and might be effective against venereal disease Inasmuch as discovery of such a means is to be expected, and as present methods are reasonably secure and in part available, and as knowledge cannot be kept from men and women, restraint of coitus, if restraint is to become general, will have to lean upon a rigidly adverse public opinion, generally adopted, upon training in strength of character and perfection of self-control, upon religious and ethical ideals, and upon a single standard of continence and fidelity for men and women alike Sexual restraint has developed at an amazing rate from century to century He who despairs of progress in this matter has never read history

Physical Injury—There is no method of control of conception that has not been accused of causing bodily and mental damage Abstinence has been condemned as freely as have mechanical devices (though not always by the same objectors) Well-considered evidence is not extant in the way of large series of fairly complete histories followed up for long years, with observation of details of sex practices There are, however, numerous published records of various local and nervous disabilities which ceased as soon as the use of the condom or withdrawal or some other contraceptive ceased There is too much of this evidence to be disregarded The weakness of it is that other possible factors are not excluded Moreover, the cases in any series are few, and some of these are reported by statements so sweeping and with such evident bias as to lessen the weight of the evidence Our Committee is collecting records on more generally accepted lines

We have nearly twenty examples of injury from the intrauterine stem one death, two removals of the pelvic organs for disability and inflammation, and the rest infections There were also several pregnancies despite its use. Even the doctor who showed me over 1000 card records of use of the stem said it could only be counted on when removed every six or eight weeks, leaving the gutters cut by the wires to heal, and then replacing The German aluminum intrauterine rod with its mushroom cap outside the cervix, or the looped silkworm strands of Pust above the extracervical glass button, have a convincing record of trouble as great as the Y-shaped wire wishbone mentioned above The *original* method of Mensinga (1886) was to leave his soft rubber vaginal dome in place a month at a time which bred irritations and inflammations, but such retention has long since been condemned and abandoned The condom has been accused of producing nervous disturbances and prostatic enlargements

"Defrauding," originated by Onan of Old Testament fame, is charged with grievous penalties *Coitus interruptus* and *reservatus* have carried a great share of the obloquy directed against contraception Yet this is the only contraceptive method which has had prolonged clinical follow-up A community which grew to number 300 people, strongly religious and therefore presumably emotional and intense, practiced withdrawal without emission for thirty years as a religious rite, with a frequency and duration of indulgence unparalleled elsewhere, according to available records Yet physical examination near the end of the experiment showed singularly little nervous or other disturbance, an outstanding professor of gynecology reported favorably on the women, and as for the children then bred from carefully selected parents, there is no such average for general physical well-being and mental activity known to the Metropolitan Life Insurance Company The Oneida Community in 1876 swung around to rigid monogamy I can testify to their present culture and ideals as resembling those of the best Quaker and New England townships

Contraceptive Advice will Make Women Shirk Motherhood—On the average, applicants are treated in birth control clinics after four pregnancies and with three living children, nearly half have four or more living Few young

married women apply Reports from various clinics run curiously alike in these figures, whether for America, where there are twenty-eight clinics, or for England with an equal number, for Germany with its hundred marriage advice stations, for Sweden, or for Russia If this be shirking give us more of it!

Contraception Produces Sterility—When young people marry before they can afford children, and the wife works and saves till they can, it is alleged that prevention will have produced barrenness when they do desire a baby So says one British National Birthrate Commission report (7) When I read the galley, I challenged the two writers of such statements to produce case records of young people examined at marriage and found presumably fertile, and later examined and found sterile (6) They could give no instances For years our Committee has searched for such cases and found only those where the intrauterine stem has been used Of impressions and beliefs there are several, but good evidence,—not yet This is a serious matter, for gynecologists of note have given warnings that no couple should marry until ready to procreate Such advice fosters late marriage and extension of engagements over years, whereby the dangers of illicit intercourse are increased

"Natural" and "Unnatural" Methods of Control—You will be frequently asked by conscientious and puzzled people what the distinction is An able writer like Dr Arthur Giles is so sure that he knows, that he uses words like "natural" and "insult to Nature" eleven times in two pages, opening his chapter with these dreadful threats "Nature never forgives," and "Control is a violation of the law of Nature" (7)

One resounding pronouncement is that of the Anglican Bishops at Lambeth They sanctioned "natural" modes of control, but condemned all mechanical devices and chemical means And yet the Right Reverend gentlemen may have been at variance with nature that very day, they had slept in beds, not on the ground, they had bathed in tubs, not brooks, they had scraped their chins with knives, had cleaned artificial teeth, had dressed in clothes, donned spectacles, eaten cooked food (and not with their fingers), and then been driven to the palace across a bridge and sat in chairs in a warmed room behind glass under a roof! There, they proceeded to pronounce mechanical devices as against nature's laws! To be consistent, they should, after a meal of raw turnips, have swum the Thames to the meeting, and sat about a tree in conclave on the grass, robed in the dignity of Nature's tan!

*The medical aspect of the technique of control of conception was covered in detail with lantern slide illustrations giving indications advantages and disadvantages of each method. These are omitted here.—*Editor*

Though an Episcopalian and a lover of nature, my forty years as father confessor to human beings who love in fine honor force me to differ from Lambeth Abstinence is found to be no answer, and the bishops' safe period no solution Perhaps the patients of bishops all have opposite wings of palaces to retire to at night Mine sleep in the same bed

Urgency of the Problem in New York—"Does not everybody know?" asks Dr Simon Flexner "Does not any drugstore sell the wherewithal?" In answer let us give, not the sob-story of the propagandist, but fair examples from notable services in this city

A woman in convulsions enters Bellevue, the State's largest hospital, or the Lying-In, the country's largest maternity service The baby arrives dead, the mother is barely saved On discharge, the doctor warns the patient not to become pregnant again till her bad kidneys are well No, he cannot tell her how to protect herself Where is the advice to be had? He declines to inform her True, if she becomes pregnant again, she can come back, and if it is needed to save her life or her eyesight, an operative abortion will be done Indeed, she can be aborted every four or six months if her kidneys go on strike each time But she may not be told in either of these two great institutions how to avoid the jeopardy until well enough to carry on with a pregnancy

Though the law sanctions advice to prevent breakdowns, in our newest and tallest clinic to have had twelve children is not reason enough for giving birth control advice A woman with kidneys on strike is discovered by a social worker, who sees her through a third therapeutic abortion, and after the third medical warning with treatment refused, takes her to a hospital clinic or separate birth control clinic that will give her contraceptive advice (She happens to be a Protestant) Note what happens next Soon the head of the great charity in whose service the worker performed this act of ordinary humanity is officially notified that if word comes again that any worker refers any patient for birth control advice, all contributions from members of the particular denomination will be stopped This is general experience

A feebleminded woman, with children already in the institution, enters Letchworth Village pregnant The new baby joins the other children in the institution for life If, after a few years' training, this inmate is qualified to support herself, or her husband will support her, the superintendent has no sanction to sterilize her before release, however urgently she or her family may ask it We have not the sterilization law that nineteen other states enjoy, to back the doctors of asylums—and the doctors dare not give her contraceptive advice!

We can multiply case records of this kind from our files

The need of contraception is the greater in our city in that one-sixth of the population is instructed by its priests that if this mother whom we have used as an example has uremic convulsions early in pregnancy, she must not be saved by emptying the uterus This would be deliberate murder, because the two souls—that of the mother of four and that of the second-month embryo—are equal before God The more need of contraception!

The New Preventive Medicine—The question involves every mother after delivery who requires instruction in measures to take to avoid pregnancy until she is fit to bear another child, it includes every convalescent from operation or real illness and every woman worn down by imperative overwork And the doctor who does not help to prevent the start of a pregnancy that he is persuaded will run his patient down further—how does he excuse himself for a neglect of ordinary health protection? Shall his patient, mother of two or three, without means, and married to a chronic alcoholic, go on bearing? Or this worn-out wife of a hopeless incompetent, just because she has not *yet* gotten tuberculosis, or because her strained heart muscle still compensates?

We doctors are afraid of the words "social and economic grounds" for birth control advice But the father getting mean wages or long out of work or ill, the underpaid teacher with children, the young couple who would marry if the wife could go on working and postpone childbearing a year or two, the couple with all the children they can decently rear—are we to sidestep these problems?

The Organized Opposition—It is generally supposed that one of the greatest of the churches is completely, consistently and unalterably opposed to birth control This is only partly true This church makes exceptions It sanctions birth control of three sorts under certain conditions One method is by abstinence, one is the "safe period," and one is *coitus reservatus* As long ago as 1842, the proper authority directed that a woman committed no sin whose husband insisted on withdrawal, and quoted Liguori that the confessor is not usually called upon to make inquiry upon so delicate a matter as the conjugal debt, and if his opinion is not asked, he should be silent Among its greatest leaders in social work there is evidence of strong feeling that the confessor should have a chance to absolve a woman under certain conditions—as with the worn-out mother of thirty with five children, or our patient with Bright's disease Not to do so keeps people from the confessional

This wise church can be expected to increase the number of its exceptions Said a prominent writer and speaker of this faith "We are fighting a losing fight" But the fight is well organized and carried on all fronts with calmness, with judgment, and with reason

Medical Opinion and Action Changing—The last three years have seen great alterations In Philadelphia, leaders like George de Schweinitz, Alfred Stengel, B C Hirst, Floyd Keene, Anspach, and Vaux are members of the council of the Pennsylvania Birth Control Federation The Los Angeles County Health Department under Dr Pomeroy runs birth control clinics as part of its child hygiene service So does the state-supported Colorado General Hospital There are twenty-nine birth control clinics in the United States Out-patient departments in nine of the chief hospitals of New York City give this service, as in Sloan, the Woman's, and Mt Sinai

Even so, the need in New York City is such that, after investigation, the New York Academy of Medicine in 1926 endorsed a plan for a special demonstration clinic under responsible and representative medical control and state license Such a clinic is needed to test technique, to follow up patients, to study adaptation of a variety of methods to individual needs, and also to determine the medical indications for contraception, for therapeutic abortion and for sterilization Heretofore, the hospital staffs have shown a languid interest in protecting their patients Here is an example

In the largest hospital of its kind in this country, where the staff has known for four years that birth control treatment is skilfully given in the gynecological out-patient service, in some months there are as many as four cases referred for abortion, these abortions to be done for grave disease on patients who have been, mark you, many months in the care of the doctor referring Prevention of abortion is a neglected branch of preventive medicine

To meet the recommendation of the Academy for a special study, ten national figures in medicine have stood ready to incorporate and undertake responsibility for a demonstration clinic on the lines of these specifications Mrs Sanger has offered her Bureau for Clinical Research, an active clinic with fifteen sessions weekly, and 1,500 new cases a year, to be taken over for responsible medical control under the Academy plan

In 1923 application was made to the State Board of Charities for a license (1) The three standard requirements for license—to show the need, to have sufficient funds, and acceptable incorporators—were met, as the Board acknowledged, but it thereupon developed an extraordinary and new requirement, i e, that before this scientific investigation under the highest auspices could proceed, the chief church organizations must waive objections Waivers were available from the Jewish and Episcopal Churches and the Federal Council of Protestant sects, only one Church ignored all communications The plan

of the Academy, the fact that professors from Bellevue, Long Island Harvard, Johns Hopkins and the University of Illinois, and others well known, would be in control, availed nothing A scientific investigation having the highest professional endorsement must await ecclesiastical sanction Finally, after many months of effort in the fall of 1926, the Board declined to grant the license on the ground that it was against public policy to license further specialty clinics in New York City Consequently the only *extensive* clinical study of birth control in existence equipped with proper histories and follow-up, must continue to function behind the sign of a private practitioner and is still denied the character of medical supervision and the kind of recognition, inspection and affiliation it might otherwise secure

The Legal Tangle—The doctor asks nothing but freedom—clearly worded freedom—to do for his patients what he wants done for his own wife and daughters

But has he this freedom? Let us see

National Laws Taking first the United States as a whole, no doctor can without breaking the law use the United States mails or any common carrier to *receive* or to *send* information or material having to do with the control of conception directly or indirectly In 1873 the control of conception was legally described as *obscene, lewd, lascivious, filthy* and *indecent*, and therefore to aid and abet it was a criminal offense There are five articles in the Federal criminal code covering this 102, 211, 245, 305 and 312 These laws include scientific books, pamphlets, journals, and illustrations, as well as mechanical devices, drugs or prescriptions They are sweeping and explicit and apply to everybody alike with no exceptions or qualifications Successive serious attempts have found no loopholes for other interpretation and all efforts to secure amendments have failed *

Restrictive State Laws But, even if knowledge or the wherewithal for controlling conception is not transmissible by post or other carrier, surely the doctor in any given locality can practice preventive medicine in this field, with indigenous information and home grown material?

In fifteen states he cannot do so freely, because of restrictive state laws, and in six others he can only by exception This leaves twenty-eight states where, more or less unimpeded, he can give such advice as he can develop for himself or learn by word of mouth, and treat with such means as he can make or secure without help from the post office or other common carrier

The state restrictions vary, but most of them are patterned on the United States laws and were passed in the decade following the Comstock laws (1873)

In ten states no one may give contraceptive advice or material, or seek it, or tell anyone where it may be obtained Physicians are not exempt, either by statute or interpretation in Pennsylvania, the District of Columbia, Missouri, Nebraska, Kansas, Mississippi, Montana, Arizona, Idaho and Washington

To be sure, medical colleges and books are exempt in Nebraska, Missouri and Pennsylvania, and medical books in Kansas But whatever a doctor learns by these means must be kept to himself if the law is to be obeyed

In our neighboring state, Connecticut, no one may *'use* any drug, medical article, or instrument for the purpose of preventing conception" This is the only state where the *practice* is forbidden and where the title of the law specifies its purpose. This unenforced and unenforceable law has recently been upheld by the state assembly when confronted with a bill calling for its removal

Five other states, Maine, New Hampshire, Massachusetts, New Jersey and California, have general obscenity laws against advertisement or sale or possession of contraceptive information or material, which by implication may hamper clinical practice, because the medical profession is not specifically exempt, and the law has not been *formally* interpreted The New Jersey law has a provisory clause to the effect that contraceptive information and material may not be transmitted without "just cause." A clinic has been started in Newark with a notable group of physicians on its medical board In California there are several clinics, one under Government auspices, and in Massachusetts a Birth Control League with leading medical names has been started

State Laws Exempting Medicine In the states where the medical man is exempt from the legal penalties laid on the commoner, this is how the line is drawn

Physicians, medical books, medical colleges and *druggists* are exempt in Ohio, Indiana, Colorado and Wyoming, and *physicians* alone in Nevada and New York (In Colorado no 'knowledge" of contraception can be brought into the state!)

This brings us to our own state of New York where the doctor is in a unique position By a recent statute (1926) he risks losing his license if he gives contraceptive advice even for grave disease By an earlier law (1881) he is per-

*That information and material are sent without molestation by doctor to doctor or by doctor to patient is beside the point. The practice is bootlegging and is carried on by sufferance as no government agent has been willing to give any doctor a written assurance of non interference The Income Tax Bureau has just declared that a certain large contributor to the birth control movement must pay a tax on portions of his income for which he claimed exemption because the donations were made to an organization that broke the law The particular instance cited was the referring of a patient appealing by letter for birth control information to the Bureau for Contraceptive Advice run by Johns Hopkins physicians in Baltimore. No instruction was given the woman was merely directed to a clinic conducted openly but the law may be construed to include this direction as information 'calculated to lead another to use or apply it for preventing conception.'

mitted to give this advice To the unlegal mind it sounds like this "You may, but you must not"

The Medical Practice Act of 1926 provides (174,e) that the license of a practitioner may be revoked " if he undertakes in any manner or by any means to violate *Section* 1142" of the State Penal Law Section 1142, passed in 1873, deals with "indecent articles" and provides among other things that *any* person is guilty of a misdemeanor who furnishes or has in his possession any article or recipe for the prevention of conception, or leads another to use it or gives information where such can be obtained No exception for physicians is mentioned in this Section nor in the Medical Practice Act But, as an afterthought, in a section (1145) further on, hidden in verbiage, with careful avoidance of the crucial words, as it were by inference, doctor and patient are declared *not* guilty when acting to cure or prevent disease (Section 1145 was passed in 1881)

By the addition of a few words the ambiguity and obscurity could be done away with In the 1929 bill (Assembly Introductory No 35) it was proposed to amend Section 1145 so that "contraceptive treatment" should no longer be hidden or left to inference, but directly indicated and in addition be mentioned as "for married persons." (See appended text of New York State laws and the proposed amendment) This bill like several predecessors was not voted out of the Codes Committee

It is suggested that another year the amending bill be directed to Section 142 as well, or instead of, 1145 The simplest way of getting order would be to take control of conception out of the category of "indecent articles" But if restrictive legislation is deemed desirable then 1142 should carry an exempting clause, either excepting physicians, or calling attention to 1145 Also the amendment to 1145 should read "contraceptive advice" rather than treatment, as this implies a therapeutic usage, whereas economic and social reasons should be admissible in a reasonable program of preventive medicine

Summary and Conclusion—Histories which disprove many of the common accusations against birth control are in our hands These seem to show that

(1) *The usual methods are harmless* It is the little used intrauterine stem and an abandoned German practice that have done the damage

(2) *Production of sterility is not proved* Evidence is lacking, in our six-year hunt for case records, of sterility from methods other than the intrauterine stem

(3) *The methods are reasonably effective* Clinically approved methods show ninety-five per cent protection, which compares well with medical treatment of other sorts

(4) *Women do not shirk motherhood* They come to clinics usually after four pregnancies, with three living children, nearly half have four or more living This applies to England, Germany, Sweden and Russia, as well as to America

Three of the great strides of medicine are toward the

Control of pain in labor and operation
Control of infection in obstetrics and surgery
Control of communicable disease

These three, made in the face of opposition and indifference on the part of the organized profession, are now its common pride and glory

A fourth control, control of conception, needed to safeguard life and health and happiness, though now suspect and maligned, will take its place of honor with these others Courage and wisdom were required to restrain the forces of disease and death A greater courage and a higher wisdom are called for within our profession to undertake a guiding part in the control of life

THE WORK OF THE MEDICAL SOCIETY OF THE COUNTY OF NEW YORK*

By DeWITT STETTEN, NEW YORK

Abstract of the Inaugural Address of President DeWitt Stetten, January 28, 1929

In an association as large and as unwieldy as ours, with a membership of nearly four thousand, its actual machinery must be left in the hands of a comparatively small executive committee like our Comitia Minora It is further advantageous, nay essential, that the Comitia be, as it has been, relatively self-perpetuating, and that advancements be made from the lower to the higher positions of men, who have been trained in the workings of the organization We would have nothing but chaos in such a complicated outfit if untrained men, with no experience in the needs of the Society, with no knowledge of the technique of its management, were suddenly placed in positions of authority If men want to work and they show qualifications and capabilty for such work the Comitia is only too glad to welcome them to their midst, but they must start from the bottom rungs of the ladder, first on the Committees, then as chairmen of such Committees, then in lesser positions on the Comitia, and then they can finally advance to positions of seniority

I shall give you a brief recapitulation of the more important matters that have been handled by the various Committees under the supervision and control of the Comitia, reminding you at the same time that we have often been hampered by lack of jurisdiction or even by actual legal restriction

The Board of Censors has listened to numerous complaints and in an impartial and judicial manner has given its decisions Although there were no cases actually requiring discipline during the year, many of the cases investigated resulted in steering men whose behavior had been questionable along the proper paths by kindly advice and admonition, with a most salutary effect upon their future professional behavior

Your Counsel has worked untiringly with the Comitia, the Board of Censors, the Committee on Membership, and the Committee on Civic Policy He has been on the alert in bringing to the attention of the District Attorney's office all cases of illegal or fraudulent practice, and has made a thorough study of the Constitution and By-laws He has, with the co-operation of the Comitia, helped to organize an Insurance Bureau to assist the members with their insurance problems and eventually to obtain for them reduced rates by means of group insurance He has worked with the Grand Jurors Association of the City of New York and with representatives of the Citizens Committee against Fraudulent Claims to help suppress the "ambulance chasing doctor" He has further made an exhaustive study of the legal status of the Cornell Pay Clinic and has reached certain very pertinent conclusions on which further action on the part of the Society will be based, especially toward preventing the abuse of charity by patients who can afford to pay

Your Committee on Legislation has watched most vigilantly all medical legislative measures and has carefully analyzed no less than 93 State Legislature bills pertaining to the public health and the welfare of the medical profession

Your Committee on Membership has rigidly studied the applications for membership, admitting the desirable and excluding the undesirable With the cooperation of the Special Committee on New Members, which has issued a card outlining the advantages of membership in the organization, it has raised the membership from 3,700 to 3,830, or a net gain of 130 in the year

Your Committee on Civic Policy has made a thorough investigation of the Life Extension Institute, which the Committee has found to be operating within the law as now interpreted, in spite of all the objections that may be advanced against the activities of this organization The Committee had favored and urged the consolidation of all the municipal hospitals "Medical Week" has continued to function in a most efficient manner under the able editorship of the Chairman of the Committee Besides calling the attention of the profession in its well-chosen editorials to the live questions that are constantly arising, it has kept the profession informed of the various activities of the Society and of its Committees, and has also accurately reported the medical news of the week and the scientific programs of the various local medical societies

Your Special Committee on Hospitals has made an exhaustive study of the question of the "closed" versus the "open" hospital, and has reached the conclusion that in our community at least the "closed" hospital is the more desirable plan for the care of the sick and for the education of the medical student and the training of the interne and the nurse, but that certain modifications should be made toward extending wherever practicable the courtesy privileges to as many physicians as possible

Your Special Committee on Dispensaries has studied the problem of the Cornell Pay Clinic and has concluded that as a group diagnostic clinic for persons of moderate means

*Published in full in the *Medical Journal and Record* February 20 and March 6 1929

who rightfully come within the provisions of the Dispensary Law, and who are referred to the Clinic by their physicians, it is a desirable institution, but that it should not function as a treatment clinic, as it enters into unfair competition with the medical profession and encroaches upon the field of the practicing physician

Your Special Committee on Nursing has found that there is a need for educating the public to meet the legitimate cost of sickness, that serious thought must be given to what now seems inevitable, an eight hour nursing day and a six day working week for the nurse, that too great stress has been laid upon nursing education on a university basis, that greater encouragement should be given to the training of practical nurses by small hospitals and institutions for the treatment of chronic disease, that an effort should be made to increase the supply of foreign language nurses, and that the medical profession, through the State Society, should play a greater rôle in regulating the curricula in the schools of nursing

Your Special Committee on Radiological Laboratories has granted certificates to a considerable number of qualified radiological laboratories It has persistently fought the unqualified commercial laboratories because of their imperfect work and questionable practices, and has found that the primary reason for their continued existence is due largely to the patronage that has been given to them, in many instances, by the very men who cry out most loudly against their encroachment on the profession—the reason for this patronage being often of a purely selfish and material character

Your Special Committee on Clinical and Pathological Laboratories has approved of thirteen laboratories, and has found the identical problems in regard to the commercial clinical and pathological laboratories as has been found in the case of the commercial radiological laboratories just referred to

Your Special Committee on Physiotherapy has worked unceasingly for the enforcement of the physiotherapy clause in the new Medical Practice Act

Your Special Committee on Press and Publicity has co-operated with a similar committee of the New York Academy of Medicine This cooperation has resulted in the formation, under their joint auspices of the Medical Information Bureau

Your Special Committee on Economics has made a most intensive study of the fee-splitting evil, including an analysis of a questionnaire sent to all members of the Society It has concluded that fee-splitting in any form was to be condemned, and that an open division of fees at a fixed rate between the specialist and the general practitioner with the full knowledge of the patient would in no wise help the situation The Committee feels that the only way to combat this evil is by educating the public as to the value of the services of the general practitioner and as to the need of his association with the specialist, both by his attendance at operations and his co-operation in the post-operative treatment

Your Special Committee on Periodic Health Examination has continued to bring before the public the advantages of periodic health examinations, in which work it has had the generous financial aid and assistance of the New York Tuberculosis and Health Association and the Milbank Memorial Fund During the year it concentrated its activities on the Bellevue-Yorkville District co-operating with the Bellevue-Yorkville Health Demonstration It also co-operated with the Department of Health in having health examinations made of every school child in this district It has been working steadily toward the idea of educating the public not only to have this regular health examination made, but to have it performed by the family physician

Your Special Committee on Public Health Education has carried out its usual program in giving a course of free lectures to the public on the prevention of disease, and the Milk Commission has functionated with the same success in bringing pure milk to the City as in previous years

In addition to this, there have been held eight very profitable stated meetings of the Society, at which numerous papers, many of great scientific merit, were presented

Now what of the future—and particularly what program have we for the coming year? Let me briefly outline our plans for 1929, and let me suggest some of the more pressing and important problems that have arisen and some of the innovations we hope to introduce

The various Committees which have worked so faithfully and capably during the past year will be maintained, with the exception of the Special Committee on Public Health Education, which has been found to duplicate much of the work already so ably handled by the Academy Ignoring factions, your President has appointed to the membership of these Committees for the ensuing year men who he thinks will work diligently for the interests of the Society Further investigation of some of the problems which have been studied will be continued, as the conclusions in many instances have not been final—such as, for instance, in the case of the Cornell Pay Clinic, or in the question of the commercial laboratories

A new Special Committee on Loan and Relief has been created to help those of our

needy and deserving colleagues, whether he be a young beginner who is about to establish himself, or an old practitioner who, because of ill health or ill luck, finds himself in financial straits A considerable fund has already been pledged by a number of our members

To cope more efficiently with the manifold and complex activities of the Society it has been deemed wise to create a new office, namely, that of Drector of Activities This has been under consideration for several years, with the thought of appointing our able secretary, Dr Dougherty, to this position, and after much persuasion he finally agreed to accept the appointment, which became effective on January 1st.

An investigation will be made of the problems created by the large medical centers—particularly as they affect the private practitioners in their vicinity, and attempts will be made to adjust differences, so that both groups will work for their mutual benefit and for the good of the community Working along these lines, and as a preliminary step toward further study, your President and Director of Activities on January 11th had a very satisfactory conference with the Dean, the Assistant Dean, and the heads of the Departments of Surgery, Medicine, and Gynecology and Obstetrics of the College of Physicians and Surgeons, and the Executive Vice-President of the Presbyterian Hospital The results of this conference will be reported to you at some later and more appropriate time

Your Committee on Legislation has already studied Prof Lindsay Rogers' report on the Workmen's Compensation Act, and has noted the abuses which he has pointed out This matter has been referred by the Comitia to the Special Committee on Economics of the County Society and to the Committee on Economics of the State Society for further action toward ending these abuses

We propose to work energetically for the enforcement of the new Medical Practice Act, which has now put teeth into the law relating to the regulation of the practice of medicine. We hope eventually to suppress completely the practice of medicine by the chiropractor and other illegal practitioners, and through the new Grievance Committee of the Board of Regents of the Department of Education to bring about the revocation of the licenses of every fraudulent practitioner and advertising quack in the County

The County Society here is the representative of organized medicine, and as such should concern itself primarily with the problems of public health and with the economic and civic aspects of the practice of medicine The County Society should leave the scientific work largely to the smaller special societies and to the New York Academy of Medicine, and its twelve sections We therefore favor the gradual reduction of purely medical programs at our stated meetings and the substitution therefor of extra-scientific presentations on the live questions of public health and medical practice—such as we will have later this evening The County Society should and will co-operate with the Academy in all overlapping problems—particularly in the questions relative to the education of the profession and the public as we have done this year in the creation of the Medical Information Bureau

The City of New York is most fortunate in the recent appointment by the Mayor of the new Commissioner of Health, Dr Shirley W Wynne, a man of broad vision who is keenly alive to the public health needs of the community and to the problems of the practitioner With the aid of the County Societies of the five counties, comprising the Greater City, he has begun a program of preventive medicine whereby the services of the private physician will be utilized for the benefit of the community, the Department of Health, and the physician himself This program has been initiated by the establishment of two tuberculosis diagnostic stations, where patients referred by the family doctor are given a thorough examination including x-ray studies and then are referred back to the doctor for treatment with a complete diagnostic record, and in addition, the Department co-operates with the doctor in placing his tuberculous patients in appropriate institutions Other such stations will subsequently be established in various parts of the City and eventually all tuberculosis treatment clinics, now in existence, will be abolished This has been followed, as you know, by an intensive Diphtheria Prevention Campaign, under the joint auspices of the Department and the County Societies, in which the public have been urged to take their children in the susceptible age to their respective family doctor for diphtheria toxin-antitoxin immunization The Commissioner has further plans along similar lines in regard to cardiac and tuberculous cases, prenatal care, the examination of school children and food handlers, and finally, periodic health examination I shall not steal any more of his thunder, because he will give you the details of his scheme a little later in the evening, but I want to go on record here as stating that he shall have the wholehearted co-operation and support of the Medical Society of the County of New York, in this work in New York County

The Society is now also co-operating with the New York Tuberculosis and Health Association in making a study of Venereal Disease Prevalence in New York County

Now that our dues have been raised and

our finances are on a firmer basis, we believe that "Medical Week" should be purchased outright, so that this paper finally comes under our complete control and becomes what it really should be, the official organ and bulletin of the Society Its size and scope could be enlarged and in addition to the material it has carried, it could publish short papers on questions dealing with the public health and the various economic problems of medical practice It could thus be made a really potent and beneficent factor in the medico-sociological affairs of the City If the paper is owned by the Society, the advertising could be more effectively regulated and censored than is possible under our present arrangement with the publisher

We further are of the opinion that an investigation should be made into the violation of the Dispensary Law and to what extent hospitals are giving free professional service where it is not warranted, and that means should be devised to end these abuses of charity We feel certain that such a study will also show the need for an increase in moderate priced diagnostic facilities and semi-private hospital accommodations, which, as is well known, generally require partial philanthropic support The County Society may then become instrumental in diverting some of the moneys that are being misspent on free treatment for those who do not deserve it and can well afford to pay, toward this very worthy philanthropy

We favor many other things, among which might be mentioned the official retention of the services of the ex-presidents of the Society in some form or other, so that their training and experience may be utilized for the benefit of the organization We believe this might be accomplished by the formation of an Advisory Special Committee on General and Public Relations, on which all past presidents will serve ex-officio and to which could also be appointed leaders in the profession representing the various groups, specialties, hospitals, societies, and factions The duty of this Committee would be to study all problems involving the relations of the profession to the public and to bring the result of their deliberations before the Society via the Comitia for action

We favor the devising of some method whereby the County Societies of the five counties of Greater New York may work in closer harmony and co-operation, as they have recently done in the Diphtheria Prevention Campaign of the Department of Health, and in the Venereal Disease Prevalence Study that is now being made with the aid of the New York Tuberculosis and Health Association These Societies that are so closely linked geographically and politically, surely have similar ideals In many instances they also have almost identical problems If, instead of each County Society working independently, the combined weight of their united forces were brought to bear on these mutual problems, the chances of solving them satisfactorily would be greatly increased and the joint effort of the five County Societies would then exert a really vital influence on the medical and economic questions arising in the Greater City

We believe that the greatest encouragement should be given to the dissemination of reliable medical information to the public as the most rational way of combating cults and quackery This information should be given *in popular form and every possible medium* of publicity should be used, be it the newspaper, the magazine, the motion picture, the radio or the lecture platform We feel that much of this can be done through our Special Committee on Press and Publicity and through the recently established Medical Information Bureau of the Society and the Academy

We favor further the holding of open special meetings where all moot questions can be discussed and eventually referred to the Comitia as a reference committee for action We favor that the widest publicity be given to all these discussions, to educate not only the profession, but the public as well, as the surest means of solving the problems with which we are confronted We believe that all groups should be heard freely and all standpoints considered impartially We welcome constructive criticism but feel that every effort should be made to prevent petty political squabbling or obstructive parliamentary heckling

Finally, we shall pledge our unqualified support to any movement in the interest of the public health and of the general welfare of the community We are convinced that in the long run such a movement will always react toward improving both the social and economic status of the physician in that community, just as contrarywise, we feel that any movement which is inimicable to the profession is harmful to the public Much more vital than this, however, is the fact that, after all, prevention of disease and the cure of the patient is the basic ideal and ultimate aim of our calling, and therefore the primary responsibility of the County Society

With this responsibility of the organized medical profession always uppermost in our minds, I appeal to all the members for their whole-hearted assistance and sincere co-operation in carrying out this program of real progress—irrespective of the faction to which they may belong

SCIATICA A SYMPTOM IN RAPIDLY FATAL SARCOMA OF THE PELVIS

By C BURNS CRAIG M D, NEW YORK, N Y

THE following group of cases, which were observed during the past year, indicate the importance of considering the possibility of malignancy in the bones of the pelvis as the cause of sciatica in obstinate cases

Sciatica, due to involvement of the sciatic nerve or the lumbosacral plexus or its roots, by malignancy primarily in the uterus or adnexa is comparatively frequent in advanced cases Such a possibility is eliminated in the cases to be described, as they were all males And the prostate gland was negative in each case In view of the *x*-ray findings in the pelvic bones one is justified in designating them, as the primary site of the malignant process

Case I (A-13827-H) F H, a married man, 31 years of age, by occupation a confectioner, was admitted to the Neurological Institute November 26, 1926, complaining of pain in the right hip and right lower extremity

In the early part of August, 1926, the patient developed a slight pain in the upper part of the right hip anteriorly This disappeared after a few days but returned after two weeks with renewed intensity The pain continued intermittently He consulted various physicians and finally came to operation for infected ilium Oct 24 The pain at that time was very severe and the ilium was so tender that he could not stand even the slightest touch Following the operation patient not only failed to get relief but immediately became worse On coming out of the anaesthetic he noticed that he now had pain in the spine, in the lower region, and in the sacrum His recovery was surgically uneventful, the incision healed well after some drainage. The patient was told that an abscess had been found evidently involving the iliac periosteum

After a few weeks, the pain diminished in the hip and began in the right thigh and calf Severe shooting pains down the entire extremity developed Pain also seemed to go from the anterior to the posterior aspect of the thigh During all this time the patient was able to get about with considerable limping due to the pain rather than to any weakness

On admission, the patient had considerable pain in the right hip and buttocks radiating down the thigh, and in the lower vertebrae. There were no sphincteric disturbances and the genito-urinary history was entirely negative The patient did not believe he had muscular weakness He had recently experienced some numbness over the anterior aspect of the thigh Coughing and straining or sneezing did not exacerbate the pain in the hip or spine but did cause some discomfort in the right lower quadrant near the operative site

The patient had sustained no injury nor had he had any infectious disease since pertussis in childhood The family history was negative.

On examination, the patient appeared to be a well developed and well nourished male, except for a certain pallor of the skin, lying in obvious discomfort He was able to stand and walk, favoring the right side more than the left There was distinct atrophy of the right thigh and some general loss of weight There was severe pain and spasm in the right thigh and weakness in the posterior thigh muscles The reflexes in the upper extremities were active and equal The right patellar and Achilles jerks were slightly diminished as compared with the left. The upper abdominals were equal, the right lower being diminished and the cremasteric absent Plantar flexion was obtained on the left and a doubtful Babinski on the right, probably defensive activity

The cranial nerves were entirely negative

The heart, lungs and abdomen were negative except for induration in the right iliac area Rectal examination was negative

During several examinations, levels of sensory disorder were found At first a level at the tenth thoracic dermatome was found, below which all forms of sensation were diminished The level of this sensory disorder ascended gradually until it reached the upper thoracic segments Following lumbar puncture it disappeared and did not recur

Sensory examination of the two lower extremities showed no disparity

The laboratory reports were as follows The blood showed a hemoglobin of 65-70 per cent, R B C 2,800,000, W B C 8,000, neutrophiles 74 per cent, small lymphocytes 25 per cent, large mononuclears 1 per cent and transitionals 1 per cent The spinal fluid showed normal pressure, clear color, no cells and a one plus globulin The Wassermann was negative, the colloidal gold curve negative and the manometric study showed an almost complete block There was 37 mgs of protein

X-ray examination of the skull on November 29, 1926, showed the calvarium to be normal in outline and thickness The diploic channels were quite clearly visible Calcification in the pineal gland and a small deposit of calcium in the posterior commissure were present There was evidence of increased pressure The sella was of rather small capacity, clearly outlined and showed no evidence of atrophy Petro-clinoid bridging was in the process of formation on the left side. The frontal sinuses were practically absent. The basal angle was apparently normal There was no evidence of intracranial pathology It is, however, not infrequent to find the pineal gland as well calcified in a patient of this age

X-ray examination of the spine showed the cervical region to be comparatively normal No evidence of bony pathology was to be seen The cricothyroid cartilages were partly calcified The thoracic spines showed a right scoliosis but no evidence of angulation and very little evidence of compensatory twisting The intervertebral discs were even in thickness The lumbar vertebrae showed no definite variation from the normal except the spinous processes of the 5th lumbar vertebra was somewhat elongated and apparently extended into the space produced by a bifid 1st sacral vertebra The sacro-iliac joints were clear The pelvis showed some evidence suggesting bone absorption in the region of the anterior superior spine of the ilium on the right side which osteomyelitis might well have caused Elongated processes of the 5th lumbar and 1st sacral vertebræ were noted The bones of the legs showed no definite evidence of abnormality or pathology The bones of the right foot showed the outlines to be good, the terminal phalanges of the 3rd, 4th, and 5th toes had a tendency toward hammer formation The terminal phalanx of the 3rd toe of the left foot appeared to have suffered trauma The joint spaces all appeared clear

The finding of importance was the area of absorption in the right ilium suggestive of osteomyelitis

X-RAY PRINTS—LEGENDS

CASE I November 29, 1926 The right ilium in the region of the anterior superior spine presents a fan-shaped area of absorption. This porous appearance suggests osteomyelitis, but proved to be early malignancy The dark streak across the ilium is, of course, artifact in the film Other films taken at the same time showed the left ilium to be quite normal

During the patient's stay in the hospital the pain in the hips and down the sciatic distribution was intolerable Nothing, not even large doses of morphine, sufficed to give any considerable relief The patient was removed from the hospital by his family on December 20th, 1926

He was soon admitted to Bellevue Hospital, where x-rays taken December 30th, 1926, showed striated areas of absorption throughout the right side of the pelvis He was removed from Bellevue and died early in January of 1927

The cause of the sciatic symptoms—atrophy, muscle-spasm, reflex disorder, and intolerable pain, were due, obviously, to sarcoma of the bones of the right side of the pelvis The extraordinary feature was the rapidity with which the malignancy in the bone progressed In October the ilium was operated upon for osteomyelitis Possibly this procedure hastened the process In November the x-ray picture was still considered that of osteomyelitis By the last of December the bone showed a markedly degenerated state of malignancy, and the patient was dead within a month

Case 2 (A-2676-H) B P, a married man, aged 50 years, by occupation a salesman, was admitted to the Neurological Institute October 27th, 1925, complaining of pain in the left thigh and leg and pain in the right shoulder

In December, 1924, the patient suddenly experienced a sharp pain in the left calf About one week later a sharp pain developed in the region of the right scapula The pain was continuous up to April, 1925, and was confined to the left lower extremity and the right shoulder except for one occasion during April when he had a sharp attack of pain in the right leg While crossing the street he found himself unable to take another step and he had to be taken home Following this the pain increased in the outer three toes of the left foot and calf, thigh and buttocks on the left side The pain was described as similar to that of a "constantly aching tooth" The patient experienced no tenderness at that time anywhere in the bones The pain had been constantly present so that sleep had been disturbed and he had lost fifteen pounds in weight during the past year

About October 1st, 1925, the patient was admitted to a hospital After having received a few injections in the gluteal region he was operated upon and was told that the left sciatic nerve had been stretched While in the hospital the patient had a cystoscopic examination and was told that his bladder was normal The patient experienced no relief from the nerve stretching and came into the Neurological Institute for the same symptoms which he began to have in December of 1924 Aside from a hemorrhoidectomy in 1907, the patient had enjoyed good health

At the time of admission the patient was sleeping poorly because of the pain, he had no appetite and had lost fourteen pounds in weight Recent

weight was one hundred and twenty-four pounds The bowels were constipated There were no bladder symptoms The family history was negative

On examination the patient showed general emaciation, particularly in the lower extremities and the pallor of chronic illness When he walked he limped slightly on the left foot The station on either foot was secure

There was marked general wasting of the muscles, especially in the lower extremities, but no focal atrophy Marked tenderness over the entire left gluteal region was present The skin on either side of the site of the operation was extremely tender There was also marked tenderness over the spine of the scapula on the right The general muscular power was somewhat reduced throughout the muscle groups but there was no focal weakness The flexors and extensors of the feet were fairly strong and there was no inequality of the two sides

On two or three occasions fibrillary twitchings have been noted bilaterally in the gluteal muscles Otherwise there were no abnormal involuntary movements

The deep reflexes were reduced in the upper extremities but symmetrical The suprapatellar and patellar reflexes were normally active and equal The right Achilles jerk was active, the left absent The superficial abdominal reflexes were present and equal The cremasterics were absent Bilateral plantar flexion was present There were no pathological reflexes

The Kernig sign was present on each side, the left being more marked than the right Flexion of the neck and thighs, combined, caused severe pain in the left lower extremity

The sensory examination was normal for diffuse, localized and discriminatory tactile impressions and also for temperature, vibratory and muscle tendon sensibilities Pain was appreciated everywhere as pain but at times on the outer side of the lower third of the left leg and over the side of the dorsum of the foot there was a slight hypalgesia

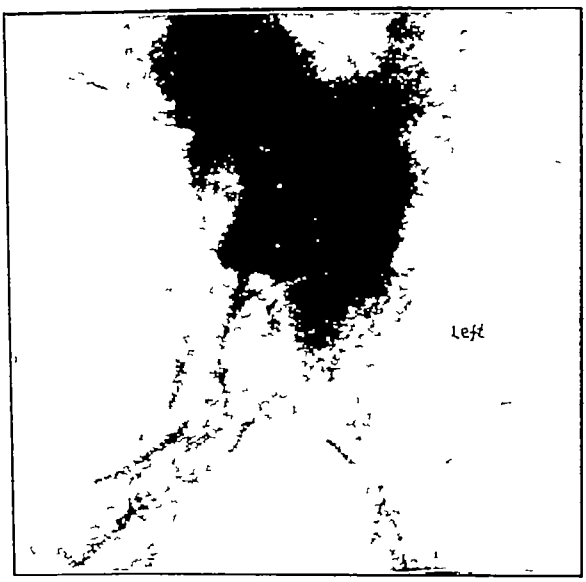
The cranial nerves were all normal

The skin revealed no naevi or other abnormalities Most of the teeth had been extracted The heart, lungs and abdomen were entirely negative Rectal examination was likewise negative

There was some irregularity of the cranial bones in the occipital region There was no tenderness of the skull About the middle of the spine of the scapula was a dense nodular infiltration of marked tenderness This mass was not connected with the skin at any point.

The mental status was entirely normal

The laboratory findings showed the following The blood count showed a hemoglobin of 70%, red blood cells 3,700,000, white blood cells 10,000, neutrophiles 67%, small lymphocytes 18%, large mononuclears 2%, and transitionals 3% The blood Wassermann was negative The morphology showed a slight anisocytosis The blood chemistry showed 32 1 mgs of urea, 15 mgs of urea nitrogen and 176% sugar The urine examination was negative



Examination by X-ray of the lumbo-sacral vertebrae showed them normal in outline and in good alignment The right side of the sacrum and sacro-iliac joints appeared normal The left side of the sacrum about the anterior inferior spine of the left iliac bone showed a distinct atrophy and bone absorption There was also bone atrophy about the left acetabulum These changes were those of malignancy There was very little, if any, evidence of bone production

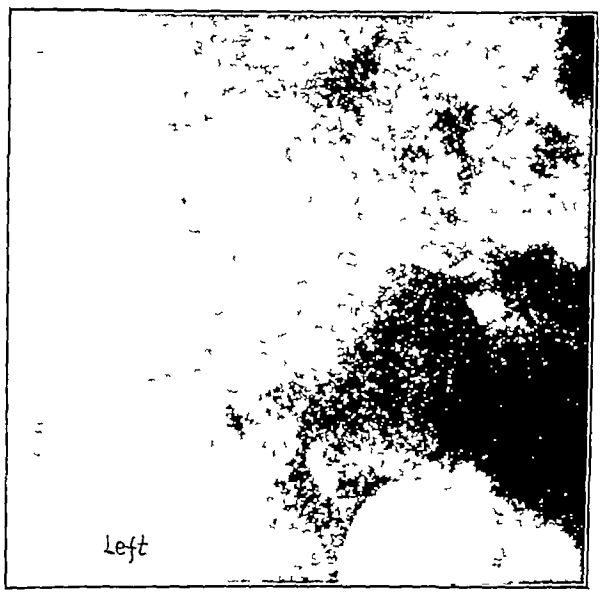
The patient got steadily worse He lost weight slowly and the pain and weakness in the left lower extremity increased He died January 22, 1926

Obviously the pain in the sciatic distribution, nine months before admission to the hospital, was due to the malignancy which was even then present in the pelvis

Case 3 (A-9993-H D P, aged 30 years, a single man, by occupation a laundry worker, was admitted to the Neurological Institute July 15th, 1926 complaining of pain and weakness in the left hip, thigh and leg

About eight months prior to admission the patient first noticed slight pain in the left groin and

CASE III—PLATE 1 August 24, 1926 A slight degree of atrophy is evident in the bones forming the left hip joint, particularly just opposite the acetabulum



hip joint Reduced strength and difficulty in movement of the left leg soon followed The pain radiated down the back of the leg During the three weeks prior to admission the condition had been much worse and the patient was unable to raise the leg when in bed The pain often kept him awake at night and he felt better sitting than

lying The patient had noticed a decrease in his libido He had lost fifteen pounds in weight in the past three months His appetite was poor and sleep difficult

Aside from diphtheria and scarlet fever in childhood he had been well The bowels were regular and urination was normal The family history was entirely negative

The patient was slightly anemic and underweight at the time of admission. There was a slight wasting of the left thigh and leg, the patient stood with most of his weight on the right leg and tended to lean to the right There was a paresis of the left leg and thigh with a slow movement at the knee joints He stood poorly on the toes, only fairly on the heels In walking on a straight line he moved to the left He walked backwards normally The finger to nose and finger to finger tests were normally performed, the finger to thumb test was slowly performed, especially on the left The skilled acts were performed fairly accurately but slowly The speech was normal There was a moderate coarse tremor of the eyelids

The deep reflexes in the upper extremities were active and equal, in the lower extremities the suprapatellar and patellar and Achilles jerks were slightly increased The superficial reflexes were reduced on the left

CASE III—PLATE 3 November 10, 1926, showing wide-spread destructive process in the bones of the left side of the pelvis and in the femur, obviously malignant (Film reversed in printing)

The muscle power was reduced in the left thigh and leg All the muscles of the two thighs and left leg were soft and flabby and reduced in size

There was a very slight diminution to pain sensation on the left side from the crest of the ilium up to about the 7th thoracic dermatome The 6th thoracic spine was tender Tactile acuity, localization and discrimination, as well as temperature, vibratory and muscle tendon sensibilities were all normal

The examination of the eyes showed the pupils to be unequal, the right measuring 4 mm and the left 3 mm in diameter They were round in shape and central in position, the reaction to light, accommodation and to convergence was normal

CASE III—PLATE 2 October 8, 1926 Showing the surgical displacement of the great trochanter to produce a fixed joint. The joint was considered tuberculous (Film reversed in printing)

There was no diplopia or nystagmus The palpebral fissures were equal

The masseter seemed weaker on the left than on the right The rest of the cranial nerves were entirely normal

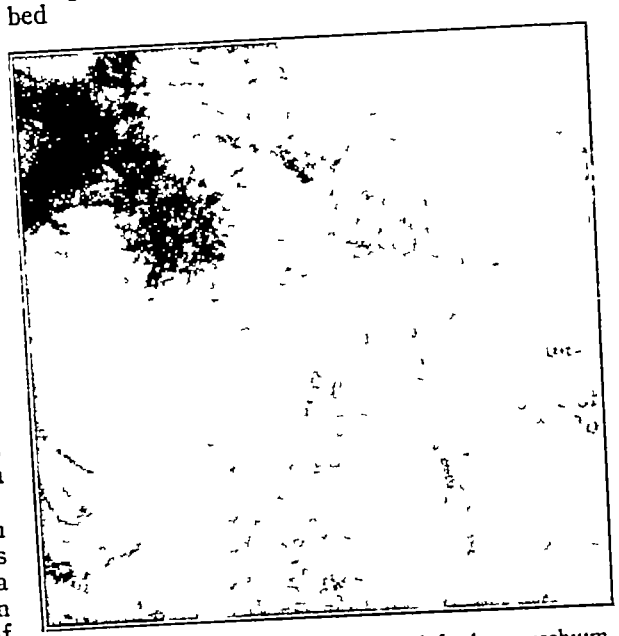
The systemic examination was entirely negative except that the patient had had pyorrhea and the nails showed a tendency to concave curvature Rectal examination of the prostate was negative

The laboratory findings were as follows The blood count showed a hemoglobin of 75%, red blood cells 4,000,000, white blood cells 5,500, neutrophiles 55%, small lymphocytes 44% and transitionals 1% The blood Wassermann was negative The spinal fluid showed a normal pressure, clear color and no cells or globulin excess, the colloidal gold curve was negative, there was 16 mgs of protein and the spinal fouid Wassermann was negative with a negative manometric study The urine examination was negative except for moderate white blood cells and epithelial cells

X-ray examination July 16, 1926, of the sacroiliac joints and lumbar vertebrae showed the vertebrae to be comparatively normal except that the 5th lumbar which was partly sacralized on both

sides, more so on the left where it had entered into the sacro-iliac joint and produced a true lumbo-sacro-iliac joint The sacralization on the right side was not as complete The left sacroiliac joint was somewhat cloudy as compared with the right. This was thought to be a low grade arthritis possibly accentuated by the abnormal joint on this side mentioned above

X-ray examination August 16, 1926, showed the cervical and thoracic vertebrae negative The hip joint spaces were clear and the articulating surfaces smooth There was slight evidence of atrophy in the bones forming the left hip but by no means a marked condition No atrophy in the femur Otherwise the findings were as previously reported



A tentative diagnosis of early tuberculosis of the left hip joint was made

The patient was transferred to the Hospital for Ruptured and Crippled August 21, 1926, where the diagnosis of tuberculosis of the left hip was confirmed and he was subjected to a fixation operation on August 27, 1926 This gave no relief from pain, which was constant After six weeks the plaster-cast was removed *X*-ray examination showed little if any change in the bone disease The patient complained incessantly of pain, which only morphine would, in a measure, relieve His temperature rose gradually He developed a slight cough Three months after the operation *r*-ray examination showed an extreme state of destruction of the acetabulum and the ilium with central dislocation of the head of the femur In the chest were areas of metastases The patient continued in great pain dying December 7, 1926

The course of the disease in this case, at least, that portion of the course manifesting pain, had run about fourteen months Repeated *r*-ray examination of the hip-joint and pelvis revealed such uncertain changes, that led in conjunction with the chronicity of the disease to the erroneous diagnosis of tuberculosis Not until within a month of the fatal termination was the true character of the bone changes certain Possibly as in the second case the malignant degeneration was hastened by surgical procedure

Case 4 (B-24-H) M S, a married man, 36 years of age, Polish, by occupation a cap-maker, was admitted to the Neurological Institute January 3, 1927, complaining of dull constant aching pain in the back of the thigh, radiating down the left thigh and leg with occasional paroxysms of darting or boring pain since June 1926

About six months prior to admission the patient commenced to have a dull aching pain in the left hip, localized in the sacroiliac region This pain was more or less constant Two months later, August, 1926, the pain radiated down the left thigh and in October began to radiate into the leg Occasionally the patient would experience darting or boring pain from above downward along the course of the sciatic nerve Any movement of the leg or pressure caused aggravation of the pain in the hip The patient kept the hip and knee flexed in order to alleviate the pain He was most comfortable when lying on the abdomen Rainy damp weather accentuated the pain The patient had spent the last four months in bed

CASE IV—January 5, 1927 The left ilium, ischium, pubis and head of the femur are riddled with a destructive malignant process The normal osseous architecture has been destroyed and there is no evidence of reparative process

The patient had the nose operated upon sometime in 1925 He has had measles and pneumonia in 1907 The patient gives a suspicious history of lues in 1925 The family history was negative except for the fact that his wife has had no pregnancies during the twelve years that they have been married

On examination, the patient presented an expression of pain and cachectic pallor was present There was evidence of general loss of weight

There was considerable atrophy in the left lower extremity including the calf, biceps, quadriceps and lower gluteal muscles Deep in the upper, left gluteal region, above the great trochanter and below the crest of the ilium, was a tumor mass the size of a base ball It was immovably attached to the deep structure and not attached to the skin. There was some muscle spasm on palpation, though the mass was not particularly tender The left sacro-iliac joint was exquisitely tender The sciatic nerve from the notch to the popliteal space and the external popliteal branch were very tender The strength of the atrophic muscles of the left lower extremity was greatly reduced

Because of the pain the gait and equilibratory tests could not be made The deep reflexes as

* The author is indebted to Dr L. C. Wagner for the surgical history of Case III

well as the superficial were all present The left knee jerks and the ankle jerks were very prompt, but not as vigorous on the left as those on the right The sensory examination was entirely normal The cranial nerves were likewise normal There was a small mole over the right sacroiliac joint and an enlarged inguinal node on the left side Rectal examination of the prostate revealed it normal in contour and consistency, and the seminal vessels were negative There was resistance on the left side of the rectum, greater on the right than on the left There was sacroiliac tenderness on the left There was no hip joint spasm Patrick test was positive Lassague's sign was positive on the left

The laboratory examinations showed the following the blood count showed a hemoglobin of 80%, color index 9, red blood cells 4,400,000, white blood cells 12,000, neutrophiles 68%, small lymphocytes 30%, large mononuclears 1% and eosinophiles 1% The blood Wassermann was negative. Urine examination showed the color to be clear amber, acid reaction, specific gravity of 1030, no albumin or sugar, indicanuodide reaction, a few leucocytes were present and mucus threads.

X-ray examination of the teeth showed evidence of pyorrhea in the incisor region but nothing to indicate an abscess

X-ray examination of the pelvis and lumbar vertebrae showed the vertebrae to be comparatively normal in outline and in good alignment The 1st sacral vertebra was bifid The lower sacral spines were bifid The left acetabulum, the ramus of the pubis, the iliac bone and the head of the femur were all involved in a destructive process which had practically riddled the bone There was no evidence of reparative change The radiating destruction of the bone structure and the amount of destruction indicated sarcomatosis

For six months this patient had been going about searching for relief The possibility of the malignant character of the disease causing this patient's sciatic pain was not appreciated Not only were no *x*-rays made, but the deep seated mass in the left gluteal was undetected The determination of malignancy six months prior might have enhanced the possibility of relief or improvement by radiation or lead therapy

He was transferred to St Luke's Hospital for treatment on January 10th, 1927, and discharged from there March 15th, 1927 The date of death which occurred not long afterward could not be learned

General loss of weight	Yes	Yes	Yes	Yes
Pain in sciatic distribution	Yes	Yes	Yes	Yes
Spasm in hip muscles	Yes	Yes	No	Yes
Atrophy	Thigh	No	Thigh & leg	Thigh & leg
Weakness of muscles supplied by sciatic	Yes	No	Yes	Yes
Neural and muscular tenderness in sciatic distribution	Yes	No	Yes	Yes
Achilles jerk	Dim	No	Incr	Dim.
Plantar response	Dim	Good	Good	Good
Sensory disorder in sciatic distribution	No	Very Slight	No	No

Possibly the surgical stretching of the sciatic in the second case altered the findings

While, from so few cases, no wide conclusions are justified, there is a distinct similarity in the symptoms In each case the *x*-ray finding of decalcified areas in the pelvic bones or cloudiness about the hip joint was of the highest importance. In the early period, these changes were of doubtful interpretation, suggesting osteomyelitis or arthritis But once the malignant process overcame a certain point of resistance the destruction was rapid and extensive

Sciatica being only a symptom, the pathology is, in the vast majority of cases in the bones or joints of the pelvis or in the viscera within the pelvis Rarely the pathological process is in the spine

In cases such as the above where no pathology shows in the first *x*-ray and the sciatic pain is severe and persistent, repetition of the *x*-ray examination is advisable

Even in non-malignant cases, sacroiliac arthritis, sometimes shows up in later *x*-ray films which was not apparent at the time of the early *x*-ray examination

The striking feature of this small group of cases was the fulminating type of the malignancy It was fatal in five months in one case, nine months in another, and eleven months in two cases, from the date of the first symptom

Chairman—CARL G. LEO-WOLF, M.D, Niagara Falls
Vice-Chairman—JOHN AIKMAN, M D, Rochester
Secretary—MARSHALL C. PEASE M.D, New York

Eye, Ear Nose and Throat

Chairman—HARRY M WEED M.D, Buffalo
Secretary—EDWIN S INGERSOLL, M.D, Rochester

Public Health Hygiene and Sanitation

Chairman—LEO F SCHIFF, M.D, Plattsburg
Secretary—WILLIAM L. MUNSON, M.D, Granville

Neurology and Psychiatry

Chairman—DAVID C. WILSON, M.D, Clifton Springs
Secretary—JAMES H HUDDLESON M.D, New York

Dermatology and Syphilology

Chairman—JEROME KINGSBURY M.D, New York
Secretary—LOUIS TULIPAN M.D, New York

Industrial Medicine

Chairman—BENJAMIN J SLATER, M.D, Rochester
Secretary—M. WEBSTER STOPER, M.D, Norwich

Next Annual Meeting in Utica, June 3-6, 1929

For list of officers of County Medical Societies, see this issue, advertising page xxxvi

COME TO THE ANNUAL MEETING

This will be the last issue of the Journal to reach the members of the Medical Society of the State of New York before the annual meeting on June third in Utica. The details for the meeting have been announced in the Journal and sent by mail to every member The programs are of practical value and the schedules convenient

The officers and committeemen have completed their share of the arrangements, and it is now the duty of the members to contribute their presence to the success of the meeting

Make your hotel reservations early Bring your automobile in order that you may visit the numerous places of historic and scenic interest in the vicinity of Utica

THE OPPORTUNITY OF THE STATE MEDICAL SOCIETY

What activity of the Medical Society of the State of New York is in the greatest need of development? In another form the question may be stated What is the greatest opportunity of the Society? The answer will be found through a consideration of the comparative state of development of the several lines of work which the Society conducts

The Medical Society of the State of New York is composed of 12,000 members who constitute 75 per cent of the physicians of the State It represents the medical profession of the State, for very few physicians not belonging to it are affiliated with any other medical society It is the official medical organization of the State

The State Society benefits its members directly along four lines

1 Defense against law suits for alleged malpractice

2 Its semi-monthly Journal

3 Its courses of medical instruction

4 Economic improvements, for "the laborer is worthy of his hire"

All these lines of work are well organized, and are carried on in a routine way with satisfaction to the members However, the personal benefits which a doctor receives is not the reason why he joins his state and county medical societies Doctors are independent individualists and ask little for themselves When they meet in their societies, they say little about what they can get out of medicine or the medical society, but a great deal about what they can give to the people who need their services The compelling reason why doctors support medical societies is that they may promote the practice of scientific medicine To this principle they have dedicated their lives, not as sacrificial martyrs, but as vigorous self-supporting citizens who contribute their peculiar abilities to the common welfare as also do the bankers, the merchants, the preachers, the carpenters and the fishermen

The greatest work of medical societies in early times, as now, is that of spreading a knowledge of diagnosis and treatment, among its members It is the scientific program that draws doctors to the meetings, with sociability as an attractive by-product Members come to the meetings in order to learn how to practice medicine Social enjoyment is valued principally for the inspiration that comes with medical congeniality and opportunities to exchange medical ideas The spread of scientific knowledge among physicians of the state and county medical societies is done with efficiency and by methods which have stood the test of time Progress in scientific programs will lie in their extension rather than any great changes in their development and evolution

The Medical Society of New York has hitherto confined its efforts to preparing physicians to practice curative medicine Its greatest opportunity for development now consists in preparing the people to accept the ministrations of scientific physicians in all lines of medicine which they can offer The people, as individuals, seek medical aid when they are sick, but they are slow in taking steps for preventing sickness The causes of ill health are not only personal and individual, but they are also communal and social, and the only way they can be controlled is by community action

It is also true that individual physicians cannot control community action. That must come from a collective action of doctors through their medical societies

The people have developed a considerable degree of community action in health matters, just as they have in roads, the police, the control of crime, and other civic matters, and they are ready to go further as soon as their medical advisors will lead them Official boards of health and lay health associations have tried experiments along every conceivable line for bringing health service to all the people, even to attempting to set up the machinery by which the state should provide a complete system of medical service for the people The doctors have seen state medicine and health centers proposed by officials and repudiated by the people themselves Doctors have also seen "demonstrations" conducted by lay health organizations started independently of the people's support because of their millions of endowment, and have read the records of their successes as told by their promoters, while their failures were minimized Doctors have been pessimistic regarding health schemes imposed on the people by health departments and lay agencies coming into a community from the outside, and their criticisms have sometimes been erroneously interpreted as opposition to public health work generally What the doctors have objected to has been the paternalistic health systems dropped upon a community without the previous development of a local demand and desire for the services

Whatever plan of public health work is adopted, it is the family doctor who must carry the burden of giving all forms of health service to all the people The local physicians know what is practical and what is objectionable An individual doctor, seeing only a small part of the field of public health work, may oppose it The collective experience of the doctors of a community is necessary for judging the efficiency and value of any public health plan That collective action is available through the county medical society

The leadership of a county medical society in all forms of public health work is the basis of the plan of action developed by the Medical Society of the State of New York through its

Committee on Public Relations This Committee recognizes the need of official departments of health and lay organizations, especially in preparing the people to adopt health measures It also recognizes the necessity that committees of the county medical society should assume the leadership in the practice of public health and civic medicine It insists on the principle that outside agencies, both official and voluntary, shall submit their plans to the county medical society and modify them to suit the doctors, before they announce them to the public Any opposition which the doctors may have had better be expressed to the representatives of lay organizations behind closed doors, rather than openly proclaimed in the newspapers If a fight is carried on openly, the advantage lies with the lay organizations with their money, their prestige, and their political experience

There is abundant evidence to show that physicians are willing and anxious to discharge their civic duties and to give the officers of their county societies the authority to speak for them, and to enter into working agreements with other health organizations

Physicians will also approve and support their officers and committees in carrying out the agreements into which they enter The Suffolk County Medical Society, for example, has been the originator and promoter of all public health plans and developments in the county, beginning in 1912 It produced the Tuberculosis Sanitorium in 1916 and established a County Department of Health last Fall The Saratoga Medical Society has devised a plan for carrying on school medical inspections described on page 104 of the January 15th issue of this JOURNAL The Tioga Medical Society has secured the establishment of a system of public health nursing These outstanding examples of public health work, accomplished by the initiative of the doctors is proof that the doctors in all the other counties will assume the leadership in public health work if only they themselves are properly led and instructed by the central committee of the state medical society

The basis of medical leadership in public health work is that the members of the medical society shall discover their own needs, and shall start a campaign to meet them without waiting for an outside organization to force the doctors into action The seven county public health surveys which have already been published form a most excellent beginning of the efforts of doctors to diagnose the public health conditions in their own communities The Committee on Public Relations has demonstrated that county medical societies will respond when the State Society leaders assist them with advice and counsel, but keep themselves in the background when local publicity work is to be carried on or conferences with local officials are to be held Developing the work of the public relations committee in every county society is the greatest opportunity of the Medical Society of the State of New York

The results that may be expected from the assertion of medical leadership by the doctors are far greater than the accomplishment of specific objects such as a local nursing service

When the doctors assert themselves, the people and public officials will show them a respect which is often lacking while physicians do nothing of a civic nature Gone will be the days when legislators will charge the doctors with supporting bills for the sake of their own profit When a county medical society takes a definite stand on a civic matter, its members will command a respectful hearing in their own right as experts in the field of public health, and when the society succeeds in accomplishing one object, it can accomplish others with ease

---

FEATURES OF THE ANNUAL MEETING

That meeting of the Medical Society of the State of New York is successful which leaves pleasant memories and a desire to go to the next one A physician will remember an outstanding scientific address, a debate on an important policy, and an inspiring review of a general subject illustrated with lantern slides, but the memory of the scientific events will merge with that of similar features of other meetings, for the individual items lose their identity in one's general fund of medical knowledge

A memory that is still clearer will be that of medical friends, new and old, whom the visiting doctor meets in the corridors and dining rooms Social conversations, with the exchange of ideas, endow the practice of scientific medicine with a personal interest and inspiration as the physician discovers that other doctors also experience his fears, his aspirations, and his ideals Friendships made at meetings of the State Society are among the most valuable and enduring that the doctor forms

The most vivid memories of all that a doctor carries away from a meeting of the State Society are likely to be those of the locality where the meeting is held —the City itself and its hotels which make the doctor feel at home, the theatres where he may find relaxation and recreation, the museums where he may learn the historic part which people of the vicinity took in the development of the city and the nation, and the accessible suburbs which allure the doctors to make pilgrimages to shrines of history and beauty The urge to visit places of fame is present

in every person, and the memory of the trips will be a vivid incentive to learn more about the events associated with the places

The meeting of the State Society to be held in Utica beginning on June 3, will be characterized with the personal touch which is associated with the smaller cities The members of the Oneida County Medical Society feel a personal responsibility for the comfort and pleasure of their professional brethren and wives, and are exerting every effort to provide the entertainment features of the annual meeting What other City than Utica could produce a group of players and musicians dominated by medical men! The afterdinner entertainment to be given on Wednesday evening is an example of the interest which the physicians of Oneida County are taking to entertain the visiting doctors

The physicians of Oneida County will also be ready to explain the historic points in the vicinity of Utica Some of the most stirring events of Revolutionary times occurred within Oneida County Utica sprung up around Fort Schuyler which guarded the fords of the Mohawk at the foot of Genesee Street Rome was built on the site of Fort Stanwix, on whose ramparts the present flag of the United States was first displayed in battle Nine miles west of Utica is the battle ground of Oriskany where General Nicholas Herkimer with his Valley militia stopped the progress of the British who were besieging Fort Stanwix and turned them back from their plan to meet Burgoyne at Saratoga Fifteen miles east of Utica is Herkimer, the site of Fort Dayton where General Herkimer assembled his army before the Battle of Oriskany, and nine miles further east is the General's home, now a Museum Nine miles southwest of Utica is Hamilton College, founded in 1794, by Samuel Kirkland who in Revolutionary times had held the Oneida Indians true to the colonists Trips to all these and other historic points may be made with the advice and assistance of the Local Committee

It is the earnest intention of the Committee on Arrangements to satisfy the visiting doctors scientifically, socially and culturally

---

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Diphtheria —The attitude of doctors toward diphtheria nine years after the discovery of antitoxin is shown by an article in this JOURNAL for May, 1904, written by Dr J R Sturtevant of Theresa, Jefferson County, and read before the New York State Medical Association on October 20, 1903 The Doctor said

"I have repeatedly seen several families in the same neighborhood afflicted in turn when the source could not be traced to any common cause other than that of communication There is undoubtedly one source of contagion which occasionally is noticed in the country and which seldom, if ever, obtains in the towns I refer to the contraction of the disease from infected poultry

"Some time in May, 1885, the doctor was called in the night to see two children who were suffering from the disease There were no other cases in that neighborhood The servant girl had been sent home ill the week before, and her physician had pronounced the case diphtheria In casting about for the cause it was learned from a neighbor that the family who had lived in the house during the previous winter had kept hens over the summer kitchen

"I think I have had abundant reason to believe that the open cesspools which are so often seen at the doors of the farm houses are fruitful sources of diphtheritic contagion, and it is surely the duty of every physician, whether he be the health officer or not, to warn people against carelessness in this regard Filth in many forms, which is common to both city and country, is fruitful of diphtheritic consequences

"I am not a believer in the general necessity of very large doses of antitoxin Fifteen hundred units of the concentrated has, in my hands, seldom failed, and without repeating the dose I am of the opinion that the higher doses are of more utility to the treasury of the manufacturers than to the patients Very virulent cases may now and then require the larger doses"

Dr J J Walsh, in the discussion, said

"Perhaps the most interesting mystery in pathology was as to the origin of the pathogenic bacilli, their habitat and their life history outside of the human body Certain it was that a good many of the domestic animals did carry certain of these bacilli This was well known to be true of the cat

"This question seemed to be worthy of a good deal of more serious study He was pleased to know that country practitioners at the present time were so impressed with the value of diphtheria anti-toxin that they carried it in their medicine cases as they formerly did calomel"

Dr W B Ulrich, of Chester, Pa, said

"It seemed very doubtful if diphtheria could arise from decaying animal matter, when for years and years before 1859 diphtheria was an unknown disease He wished, in conclusion, to urge the merits of *ad libitum* doses of chlorate of potash and the tincture of the chloride of iron in diphtheria"

Dr E D Ferguson of Troy, N Y, said

"He had given 2,000, 3,000, 4,000 and 5,000 units, and although it might be said that this was very expensive, it was certainly much cheaper than a funeral"

MEDICAL PROGRESS

Tannic Acid Treatment of Burns—Fenwick Beekman, writing in the *Archives of Surgery*, March, 1929, xviii, 3, reports the end-results in a series of 434 cases of second and third degree burns treated at Bellevue Hospital In a group of 114 cases in which tannic acid was used the mortality was 14 9 per cent, as compared with 27.8 per cent in a group of 320 similar cases treated by other methods During the first twenty-four hours, the percentage of deaths was about the same in the two groups As death at this time is usually due to shock, it is evident that the tannic acid treatment will not affect the outcome Apparently toxemia develops rapidly after the inception of a burn, and in the majority of patients who die from it the fatality results within seventy-two hours If the absorption of toxins is prevented immediately, many of these deaths can be avoided Apparently the tannic acid treatment does this, thereby reducing the number of deaths in this period by three-fourths, and by two-thirds in the period of time between the end of the first and tenth days In the period following that of the toxemia, the death rate in the two groups is the same The tannic acid treatment produced more rapid healing in the second degree burns In the third degree burns the granulation tissue of the wound was in the most suitable condition for skin grafting immediately after separation of the tanned eschar, thereby promoting early healing and lessening of the formation of scar tissue There was less pain with the tannic acid treatment than with the methods formerly used The average hospital stay was increased six days by the tannic acid treatment This is probably due to the fact that patients with severe burns lived who otherwise would have died. The tannic acid treatment employed was similar to that described by Davidson, except that a 5 per cent solution was used and was applied to burns of the face, instead of the tannic acid ointment, without injury to the eyes Particular attention should be paid to the administration of fluids (5 per cent dextrose) by hypodermoclysis, as well as by mouth and rectum A patient should take at least one liter of fluid for every 25 pounds of body weight Opiates should be used sparingly, as they lessen secretions

Pathogenesis of Cardiac Insufficiency—H Schwarz sums up his study of this subject as follows there is a disturbance of the economics of the patient with progressive cardiac failure due primarily to lack of oxygen which lack is responsible for a severe disturbance of metabolism We may therefore almost rank heart disease in general among the anomalies of nutrition The lack of oxygen generates an acidosis, which in its turn further damages the circulation and contributes secondarily to an increase in the metabolic rate Naturally it is not claimed that this mechanism explains the whole of cardiac failure, for it is present alike in decompensation and where the compensation is still good That the work of the circulation is really augmented in these cases well appears from the fact that digitalis is known to diminish this work of the circulation even in the sound individual How shall we explain the shortage of oxygen? The seat of this phenomenon is in the capillary circulation but the exact process is unknown. It probably stands in some relation to the edema and there may be only an anomaly of diffusion or some actual injury to these vessels Further study will be directed to this phase of the problem The fact that the circulation in these cases is overactive is naturally in contradiction with the teachings of today and for many years past The author lays emphasis on the action of digitalis mentioned above and also on the minute-volume of the heart which is one of the best criteria of the work of the latter But in these cases of cardiac insufficiency socalled the minute-volume of the heart is diminished although in theory, perhaps, it should be increased Digitalis, which tends to reduce the minute-volume, nevertheless is our treatment for these cases The author gives credit especially to Americans for pointing out that digitalis really lowers the activity of the circulation—*Klinische Wochenschrift*, February 26, 1929

Bronchial Asthma in Childhood—M Pehu and A Mestrallet contribute a monographic study of this ailment In the summing up of the article the authors say that bronchial asthma may appear at the beginning of the end of the first half year of life, but habitually it develops between the ages of 2 and 12 Toward adolescence it becomes attenuated and little by little it ceases altogether We often note that an asthma which begins in childhood is outlived by maturity It appears to belong to the group of anaphylactic diseases but, at least in France, the specific antigen can be isolated only in a limited number of cases The symptomatology is not that of the clean-cut adult type, the cardinal signs consisting of

a respiratory embarrassment, which is more or less pronounced, and of an emphysematous respiratory rhythm, which often disappears after the attack When the dyspnea is intense we do not see any cyanosis of the extremities The modality, duration, and frequency of the attacks are very variable There are no lesions and absolutely no association with tuberculosis The subtitle of the paper shows that the authors limit themselves to etiology, symptomatology, and evolution, which explains the absence of any allusion to treatment The authors show that two affections known as spasmodic coryza and spasmodic cough may give rise to the syndrome of asthma, but this association is seen only in a small minority of cases According to some statistics given elsewhere it appears that the majority of children with spasmodic cough also have bronchial asthma Gradually the state of spasmodic cough develops into the latter Hay fever seems to have only a remote relation to bronchial asthma The antigens which cause hay fever do not as a rule affect children with true bronchial asthma The authors do not approve of the scarification tests made in the United States to detect the unknown antigens, and assert that public opinion would not sanction this practice in France—*Journal de médecine de Lyon,* Feb 20, 1929

Evolution of Buccodental Hygiene and Prophylaxis—During recent years the principles of buccodental hygiene and prophylaxis have been based solely on the idea of buccal polymicrobism and caries from external causes, and have been applied indiscriminately to all individuals Julien Tellier believes the time has come to modify this collective hygiene and to replace it with individual medical rules of hygiene based on a closer and more adequate knowledge of the special character of the tissues and organs of the gingivodental region It has by no means been proved that the clean tooth never develops caries This condition may be due to external or to internal causes, or to their combined action Internal causes prepare the way for caries The calcium metabolism of the tissues of the teeth is related to the calcium metabolism of the rest of the organism It is well known that dental sepsis may manifest itself in a great variety of disorders, such as septic gastritis, endocarditis, nephritis, neuritis, arthritis, septicemia, etc. The same is true of the varied pathological conditions described under the name of alveolodental pyorrhea In this domain we can arrive at accurate results only when, knowing the nature of the normal tissues of the gingivodental region, their normal anatomy, their embrogeny, their histology, we can proceed to the examination of the mechanisms which assure, under normal conditions, the functioning of these tissue, and to the examination of their means of resistance (actions of pressure, mastication, biting on the maxillary bones and alveolar processes, on the chemical composition of the teeth and on the quality of the periodontium) The prophylaxis of malocclusions and malpositions and their consequences is also an important chapter in buccodental hygiene Maxillofacial malformations, accompanied by glossoptosis and followed by functional disorders of the organs of respiration and of circulation form the beginning of many local and general maladies that a well understood hygiene could prevent. With the new conception of buccodental prophylaxis as being individual and medical, stomatology should study its problems by physiological, anatomicoclinical, and experimental methods of research such as are used in general medicine—*Medical Journal and Record,* March 20, 1929, cxxix, 6

Clinical Aspect of the Status Thymicolymphaticus—Professor Feer takes up this timeworn subject in a fashion which is a little "different," based on his 30 years of experience in hospitals for children The earliest descriptions were those common to the constitutional state known as lymphatism The special phenomenon known as thymus death, originally associated with enlarged thymus was later and without warrant attributed to this lymphatism, and the basic state became known as status thymicolymphaticus Eventually it was shown that socalled thymus death could not be brought into association with this status, save as a coincidence The author discusses the numerous possibilities and naturally arrives at the conclusion that in place of a status thymicolymphaticus we should think of a status endocrinicus, in which the true anomaly involves an extra-large thymus, and hypoplasia of the adrenals and gonads This insufficiency of the adrenals may be the key of the situation and there seems some sort of association between the status thymicolymphaticus and Addison's disease, myasthenia gravis, and Graves' disease, in all of which we may find an enlarged thymus Sudden death is known to follow operation in Graves' disease, especially when there is a large thymus It appears that the hyperplasia of the thymus and lymphnodes compensates in some manner for endocrine insufficiency, and that this hyperplasia has nothing to do with the causation of mysterious sudden deaths, or at most is only an indicator Many children with this status survive accidents of all kinds, while certain forms of sudden death, as that from spasm of the glottis, have falsely been ascribed to other

causes The child which dies with this accident is not strangled but dies of heart failure, and other forms of cardiac death may belong in the same group Stress is laid on the fact that these children are often hearty feeders and can easily be overfed, and that such overfeeding is very bad for them, aggravating the basic state They should avoid espeecially eggs and milk —*Schweizerische medizinische Wochenschrift,* February 16, 1929

Traumatic Facial Paralysis and Its Surgical Treatment by Free Transplantation of Fascia Lata—After showing that nerve anastomosis and muscular plastic operations for correcting the deformity caused by facial paralysis are not cosmetically very successful, Hermann Fischer describes a method of fascia lata transplantation which gave gratifying success in the case of a young girl who had had complete facial paralysis since infancy A fascial strip, 20 cm in length, was excised from the fascia lata. A small incision was then made through the skin over the zygoma and with a properly curved aneurysm needle the strip of fascia was looped around it One end of the strip, armed with a long straight needle, was pushed along subcutaneously toward the angle of the mouth until it reached a point on the upper lip, about 1 cm above the commissure of the lips The cheek was then everted by an assistant, the mucous membrane was painted with iodine, the needle passed through the mucous membrane to a point 1 cm below the commissure At this point the needle was passed through the musculature of the cheek under the skin and made to reappear in the small incision over the zygoma The loop of fascia, which now took in the insertions of the musculus zygomaticus and the musculus risorius at their points of insertion at the angle of the mouth, was pulled taut until the angle of the mouth on the paralyzed side was on a level with that of the normal side. The two ends of the fascia were knotted together and fastened with a few chromic gut sutures to the masseteric fascia A slight dimpling of the skin which appeared below the lower lip when the fascial strip was placed was rectified by pushing a Cooper's scissors through the small incision in the mucous membrane of the cheek and freeing the skin subcutaneously The small wound in the mucous membrane of the cheek and that over the zygoma were closed with interrupted sutures of silkworm gut—*Annals of Surgery,* March, 1929, lxxxix, 3

Tinnitus Aurium.—J Helsmoortel, Jr, of Antwerp, contributes an essay on this subject He points out that this symptom belongs only in part to otology for it may have to do with other fields of practice. The term tinnitus does not express the entire range of subjective noises in the ear which may include a great variety, including auditory hallucinations, various bruits connected with the circulation, and sounds which can be produced artificially It is necessary to restrict the field to certain groups at the expense of others Some of the local conditions which give rise to them are known to all and are easily corrected, notably accumulation of wax in the external ear The association of subjective noises with slight deafness is seen in colds in the head The author does not mention the additional ringing from the use of quinine in such cases, but elsewhere speaks of the role of the abuse of drugs as a cause, and mentions quinine, aspirin, and the salicylates as examples After a purely otological discussion of the noises in severe affections of the ear, such as Meniere's disease, he takes up the extra-otic causes, viz, hypertension where tinnitus is often an early symptom, and various diseases of local organs such as the stomach and kidneys, but he omits any reference to neurasthenia which is one of the familiar causes of unmotivated tinnitus The tinnitus which appears in gestation, Bright's disease, gastric disturbance, and the like may sometimes be explained by the lighting up of some latent ear trouble, by repeated vomiting, by acute anemia, etc The noises disappear when the disease in question has been for the time checked It will probably be best in the future to cease regarding tinnitus as an entity associated with the labyrinth There are many kinds of noise and many causal factors which should be isolated and grouped in the interest of better diagnosis and treatment—*Le Bulletin Medical,* Jan 23-26, 1929

An Anti-Fat Diet—Dr F Salzmann of Bad Kissingen has evolved a new diet for reducing, in the belief that while such diets abound there is room for others which embody new principles Certain food articles for example have a special quality of giving satiety which is quite independent of ordinary factors, or in other words, cannot be explained Thus lamb chops seem to be superior to other meats, even to other cuts of lamb, in this respect In this connection we may bear in mind that many people dislike lamb, which may have some relationship to this quick satiety Another food article which is very filling for the bulk used is pineapple which should be eaten raw or if canned in sugar-free forms The monotony of a strict diet, the suffering from underfeeding, must be met in a proper fashion In a period of a week or 10 days the patient may eat what he likes and as much as he likes for 2 days, although he must take but little sugar and fat Two days more are set apart for a fruit-vegetable

diet, with no meat and with two of a possible 5 meals limited to zwieback and tea or coffee The rest of the period—3 to 5 days—is given up to meals of which the chief (at noon) consists of lamb chops and pineapple The others, 3 or 4 in number, comprise only such simple foods as zwieback, apples, etc All bread save the zwieback is forbidden as are cereals and bananas All of the meals are prepared as far as possible without salt, 3 gms daily being the maximum Paraguay tea is substituted for ordinary tea and coffee if the latter cause insomnia or nervousness This may be taken freely and is believed to slow up digestion when it is too rapid Various accessories are permitted, as the use of thyroxin, diuretics, laxative waters, massage, etc Active exercise, as mountain climbing, is permissible if desired, but is not necessary, it increases the appetite, which is a disadvantage The patients are weighed daily and are found to lose most on the lamb-pineapple days Although the author has tested this diet for only about a year, his results have been so good that he wishes the experience of others —*Munchener medizinische Wochenschrift,* February 22, 1929

The Present Position of Lead Therapy in Malignant Disease—W. Blair Bell reports that of a series of 566 cancer cases, which were treated with Lewis' metallic lead or Heilbron's colloidal lead, 359 died before the treatment was completed Of 303 patients who received more than one-half of the minimum treatment advised, 65, or 21 5 per cent, showed successful results There is, furthermore, reason to believe that 40 per cent of the "too recent" cases will terminate favorably Some of these patients were treated by lead alone, others by lead and *x*-ray or lead and radium Bell lays special emphasis on the fact that while the *x*-rays, radium, and lead may each produce a beneficial effect when used separately, an aggregate effect is secured when these agencies are applied within a short time of each other It is unreasonable to think that for lead therapy in this disease all that is required is to pump lead into the patient's veins Again, the scientifically minded inquirer will not demand that a new method of treatment for cancer operating on the worst and most advanced types of the disease shall give better initial statistical results than those obtainable with other long established and standardized forms of treatment acting on early and selected cases In view of the many variable factors involved, no statistical survey at the present time could be more than suggestive When a practitioner inexperienced in the method employed fails in 25, 50, or even 100 cases, to secure a single completely satisfactory result, as easily happens with a new method of treatment, it must be remembered that negative evidence of that sort can never be weighed in the balance with that which is positive. The lead treatment is contraindicated in malignant disease of the liver and kidneys, in severe myocardial insufficiency, and in serious anemia. —*British Medical Journal,* March 9, 1929, 1, 3557

Nonsurgical Goiter—In an endeavor to clarify the existing confusion with regard to goiter, Israel Brams classifies goiters as (1) surgical or neoplastic (adenomata, fibrous and calcareous goiters, and combinations of these) and (2) nonsurgical (simple hypertrophy, colloid goiter, puberty hyperplasia, and exophthalmic goiter or Graves' disease) He does not accept the view that adenoma and Graves' disease are identical, and deplores the abuse of thyroidectomy in the above mentioned nonsurgical goiters In fully 90 per cent of cases of Graves' disease there is a history of psychic trauma Since this disease enters through the nervous system, chiefly the mental mechanism, it is through this pathway that treatment is largely to be instituted. In simple hypertrophy and colloid goiter iodine should not be employed The logical treatment consists in the elimination of all discoverable causes, including the correction of physical nad mental flaws in life's habits, and the administration of thyroid substance *under careful guidance* Radiotherapy is almost as strongly contraindicated as thyroidectomy The static wave, as advised by William Benham Snow, is frequently a valuable asset in expediting the return of the thyroid to normal size In puberty hyperplasia both iodine and thyroid extract are contraindicated If there are symptoms of neuro-endocrine instability the treatment should follow that advocated for Graves' disease, in which the guiding principles are as follows (1) An earnest attempt to ferret out and remove all discoverable etiological factors, whether intrinsic or extrinsic (2) Rest in bed, with a respite of at least three hours morning and afternoon, in the average case (3) A diet of nonflesh quality and of ample quantity, commonly twice as much food as is taken under normal conditions (4) Drugs may be employed only after careful individualization The quinine salts, corpus luteum, posterior pituitary, suprarenal cortex, arsenic, and luminal have their field of usefulness Thyroid extract, suprarenal medulla, the opiates, the iodides, and digitalis should not be given (5) Electricity is a good supplementary treatment, the Snow method of static wave applications being of signal use, but careful individualization must be exercised (6) Psychotherapy in Graves' disease is of the utmost important —*Physical Therapeutics,* March, 1929, xlvii, 3

LEGAL

By Lloyd Paul Stryker, Esq
Counsel, Medical Society of the State of New York

THE LAW PROGRESSES

Those outside the legal profession have been heard frequently to complain that the law is fixed and immovable and does not possess that flexibility which permits it to conform to existing conditions of modern life Changes in our law must necessarily proceed cautiously, so that the rights of those who have acted in reliance upon existing laws, shall not be adversely affected But the law does change, and is changing all the time In our own State, the Court of Appeals, under the able leadership of that splendid jurist Chief Justice Benjamin N Cardozo, is by its decisions giving constant proof that the Courts are seeking to conform legal procedure and legal principles to the mores of the times

A striking instance of legal reform is found in the new law in relation to decedents' estates, commonly known as the Fearon-Jenks Decedents' Estates Bill, which Governor Roosevelt signed a few weeks ago In commenting editorially upon this bill, the *New York Law Journal* said in part

"In this state for a full century the law of decedents' estates wholly failed to keep step with the vast changes in the social life of the people It particularly ignored the altered condition of women Surrogate Foley, to whom is chiefly due the enactment of the Fearon-Jenks Decedents' Estate bill, which Governor Roosevelt signed last week, has correctly characterized the new law as 'the greatest reform in the law of property in this state within the last hundred years' As chairman of the state commission to investigate defects in the laws of estates, which drafted the new legislation, he, together with his colleagues on the commission, has performed a most valuable public service The surrogate himself recently outlined, comprehensively, the main advantages of the new law, as follows

'The Fearon-Jenks bill is particularly advantageous' he said, 'to the thousands of our citizens who die leaving small estates, especially when the estate includes real property in the nature of a home It is a new charter of rights for women and gives increased protection to dependents It confines the distribution of an estate to nearer and more dependent relatives, simplifies the practice and does away with the expensive proceedings now necessary for the sale of the real property of an estate It gives statutory protection to a surviving spouse and prevents the disinheritance of a wife or husband by an unjust testator'"

It is not possible, within the confines of this article, to discuss every change which this law makes in the present law in relation to decedents' estates, nor to analyze the entire bill We shall simply attempt to point out the main changes which the bill makes in the present law, because we believe that these changes are of general interest.

Wherever the word "intestacy" is used in this article, it has reference to the effect on the property, real or personal, of a person who dies without making a will

Wherever the word "election" is used, it refers to the right of a surviving spouse, under the new law, to waive whatever provisions have been made for them by virtue of any will, and to take in lieu thereof in accordance with the terms and provisions of the new act

Abolishment of Dower and Curtesy

On and after August 31st, 1930, dower is abolished and curtesy is abolished This means, of course, that on and after August 31st, 1930, there will be no necessity for a wife joining in a deed or a mortgage upon her husband's real estate in the State of New York, unless he was seized of the said real estate prior to September 1st, 1930, and during said marriage A widow of a man dying subsequent to August 31st, 1930 will not be entitled to claim dower in any lands owned by him during the marriage, except that her inchoate dower rights existing prior to September 1st, 1930, are preserved if she prefers to assert them rather than to take the share in fee given by the new section 83 of Decedents' Estates Law Because of the latter exception she must join in deeds and mortgages where the husband was seized of the real property prior to September 1st, 1930, and during their marriage

Right of Election to Take Against the Will

A surviving spouse who is not granted by the will of the deceased spouse executed after August 31st, 1930, the share to which he or she would be entitled in intestacy, or who is not provided for in said will by the creation of a trust to the extent of such intestate share with the income thereof payable to him or her during life, may file in the Surrogate's Court, where the Letters Testamentary were issued, within six months from the date of the issuance thereof, an elec-

tion to take outright the intestate share, as if no will existed The time within which to make this election may be extended for an additional six months by an order of the Surrogate The will remains valid as to the balance of its provisions

A husband or wife during the lifetime of either, may waive the right of election to take against a particular will and testament by an instrument in writing, subscribed and acknowledged, and each may waive such right as against any and all wills and testaments of the other, by a settlement agreement executed either before or after marriage

In cases where the will does provide for the surviving spouse, there is an unlimited right of election where the intestate share of the surviving spouse does not exceed $2,500 The same, of course, is in lieu of the provisions in the will

In cases where the will does provide for the surviving spouse, and the intestate share exceeds $2,500, there is a limited right of election as follows

(a) where the intestate share is over $2,500 and the testator has created a trust in an amount equal or greater than the intestate share with income payable to the surviving spouse for life The right is to elect to take the sum of $2,500 absolutely, which sum shall be deducted from the principal of the trust fund,

(b) where the will contains an absolute legacy or devise, whether general or specific, to the surviving spouse in an amount less than the sum of $2,500, and also a provision in trust, the right is to take not more than $2,500 inclusive of the legacy or devise,

(c) where the aggregate of the provisions under the will is less than the intestate share, the right is to take the difference

The right of election hereinbefore set forth is not available to

(a) a spouse against whom and in whose favor a final decree or judgment of divorce recognized as valid by laws of this state has been rendered,

(b) a spouse against whom a final decree or judgment of separation recognized as valid by the laws of this state has been rendered,

(c) a spouse who has procured without the State of New York a final decree or judgment dissolving the marriage with the testator where such decree or judgment is not recognized as valid by the laws of this state,

(d) a husband who has neglected or refused to provide for his wife or who has abandoned her,

(e) a wife who has abandoned her husband

Descent and Distribution

A single and uniform system of descent and distribution has been created Real property descends and personal property passes to the same persons and in the same shares It would be impossible in a paper of this character to discuss all of these provisions, but it seems appropriate to point out that

(a) if there is a child or children, the surviving spouse takes outright one-third of the entire estate, and the child or children take the other two-thirds,

(b) if there is no child or children, the surviving spouse takes $5,000 and one-half of the residue, and the surviving parent or parents take the other half of the residue, both real and personal property,

(c) if the parents are both dead, the surviving spouse takes $10,000 and one-half of the residue, and the other half of the residue is divided among the relatives of the decedent, according to the statutes

Powers over Real Estate of Executor and Trustee

Every will shall be construed to give the executor or trustee the power to take possession, collect the rent and manage, sell, mortgage and lease all real property, unless the will expressly prohibits the same or the property is specifically devised The powers to sell, mortgage or lease, however, can only be exercised upon the order of the Surrogate made in a special proceeding, as prescribed in the Surrogate's Court Act

Similar powers over real estate are now conferred for the first time upon an administrator

The citizens of this State are indebted to Surrogate Foley of New York County, for his able leadership in bringing about the important changes made by this bill The bill was introduced in the Legislature only after an exhaustive investigation of the entire subject matter had been made by the Surrogates of this State, and by a special Legislative Commission with Surrogate Foley as chairman, and the law embodies the recommendations which they made after such investigation

We think it can be safely predicted that the law will do much to simplify the management of estates, and will justify the hopes of those whose work has resulted in its passage

NEWS NOTES

THE ANNUAL MEETING

The arrangements for the Annual Meeting of the Medical Society of the State of New York to be held on June 3-6, in Utica, have been completed, and the official programs sent to every member of the Society This JOURNAL of April fifteenth printed the scientific programs, and the issue of May first contained the annual reports of the officers and Committees

The headquarters of the State Society will be in the Hotel Utica, and the House of Delegates will convene in its ball room at 2 30 o'clock on Monday, June third A dinner for the Delegates will be held immediately after the afternoon session Tickets will be $2 50 each, and members are requested to obtain them before the meeting, by writing to the Secretary's office, at 2 East 103rd Street, New York City

The meeting of the House of Delegates will be continued through Monday evening and Tuesday morning, the election of officers being held on Tuesday morning

The general registration desk for members will be located in the Hotel Martin, and will be open on Tuesday morning The Commercial Exhibits will also be held in the Hotel Martin, beginning on Monday afternoon at 2 o'clock Following the custom of former years, a reception, luncheon, and entertainment will be given to the exhibitors on Monday evening in the Hotel Utica, where the House of Delegates will hold its sessions

The meetings of the Scientific Sections will be held in the Hotels Utica, Martin and Majestic on Wednesday and Thursday mornings General meetings of the combined sections will be held on the afternoons of Tuesday and Wednesday, in the Ball Room of the Hotel Martin. The programs of all the scientific meetings were printed on page 474 of the April fifteenth issue of this JOURNAL and copies have been mailed to every member

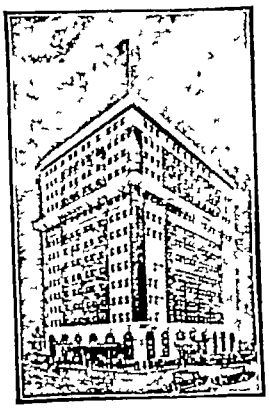
The formal annual meeting that is required by the Charter of the Society will be held in the English Room of the Hotel Utica The program of this meeting includes addresses by the President, Dr Harry R. Trick, and the Legal Counsel, Mr Lloyd Paul Stryker

The Annual Banquet will be held in the Ball Room of the Hotel Utica at 7 o'clock on Wednesday evening Tickets $5 00 The Committee on Arrangements, recalling the success of an after-dinner entertainment given twelve years ago when the State Society met in Utica, will put on an entertainment provided by Utica's Amateur Dramatic Organization, called The Players The President of this organization is a practicing physician, and many local doctors are active as singers, musicians and actors

The entertainment to be given will be an opera called "The Pirate's Bride," but it might also be called "The Doctors' Opera" for the words were written by a Utica physician, the songs by another local doctor, the music by a third, and the orchestra score by a fourth—a combination rarely found The Players' Orchestra, too, is composed largely of physicians and members of their families

The ladies will be entertained by a local committee of the wives of local physicians They will be taken on an automobile trip in cars provided by the doctors of Utica The route will be through the Lansingkill Gorge to Newport, where luncheon will be served, and then through the West Canada Creek Valley rich in historic associations If the day is rainy, a bridge party will be given at the Utica Consistory Building, 268 Genesee Street

Physicians attending the annual meeting will be interested in the hospitals located in Utica and its vicinity There are the five general hospitals of the city, the Utica General, opened in 1858, St Elizabeth's, 1806, St Luke's, 1867, Faxton, 1875, and the Utica Memorial The Tuberculosis Hospital of Oneida County is now being built on the Deerfield Hills, one mile north of Utica

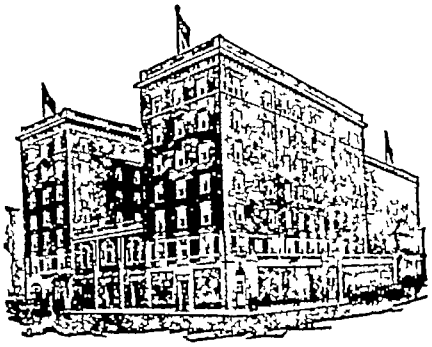


The Masonic Home and its new Soldier's and Sailor's Memorial Hospital, is located in Utica

The Utica State Hospital, within the city limits, was founded in 1843, and was the first of the State institutions for the care of mental cases It has a modern branch at Marcy, six miles west of the City Physicians will be welcomed to both institutions by Dr Richard H Hutchins, the Superintendent of both

The Hotels of Utica will provide ample accommodations for all who will attend the annual meeting The Hotels Utica, Martin, and Majestic have placed their facilities at the disposal of the physicians and have provided rooms for the meetings and the commercial exhibits These hotels are located on the principal streets of Utica The Hotel Majestic adjoints the Hotel Utica, while the Hotel Martin is two hundred yards to the east

HOTEL UTICA



The Hotel Utica, with 350 rooms, will be the general headquarters, and will be the meeting place of the House of Delegates and some of the Scientific Sections

Hotel Utica—350 rooms Single room, $3 to $6 per day, double rooms, double bed, $5 to $8, double rooms, twin beds, $6 to $8 50

HOTEL MARTIN

The Hotel Martin, with 450 rooms, will contain the Registration Desk, the Commercial Exhibits, and some of the Scientific Sections

Hotel Martin—450 rooms With bath, single $2, double $3 50 per day, with shower, single $2 50, $3, $3 50—$2 per additional persons, with private tub, single $3, 3 50, 4, twin beds with bath, $5, $5 50, $6, and $7, parlor, bedroom and bath, $10 and $12 per day

HOTEL MAJESTIC

The Hotel Majestic with 150 rooms adjoins the Hotel Utica and is only two blocks from the Hotel Martin It will entertain one of the scientific sections, and also some of the allied organizations that meet at the same time with the State Medical Society The rooms of the Hotel will be pleasant, convenient, and satisfactory

Room rates With private bath, or shower bath, single, $2 75 to $3 50, double $4 to $5 With running water near public tubs or showers, single $2 to $2 50, double, $3 50

Suites with bath are also available, and for them proportionate rates will be charged

Those who come by automobile can park their cars on Oriskany Street, on which the Hotel Martin is situated This Street occupies the course of the old Erie Canal and is of sufficient width for long lines of parking Public garages near the hotels are also available

Everybody who comes to the Annual Meeting will be interested in the Historic Mohawk Valley, and will wish to visit some of the historic sites Information regarding points of interest may be obtained at the Registration Desk, or from the Committee on Arrangements

SCHOOL MEDICAL INSPECTORS MEETING

The following announcement has been received from Dr William A Howe, Chief, Medical Inspection Bureau, State Department of Education, Albany, N Y

"May 6,1929

"Arrangements have been completed to hold two sessions for school medical inspectors at Utica on June 3rd Both sessions will be at the Hotel Martin, one at 2 00 o'clock, the other at 6 30 The evening session will be preceded by an informal dinner No formal program will be presented It is expected that many school physicians will relate their experiences Free discussion will be encouraged from the floor All school physicians of the State are cordially invited to attend"

ANNOUNCEMENT OF THE COMMITTEE ON ARRANGEMENTS

Greetings

The City of Utica and the Medical Society of the County of Oneida once again extends to the members of the Medical Society of the State of New York the hand of friendship and of greeting

To those who visited us twelve years ago, we offer you the fellowship of old comradeship, to those who were unable to attend the last meeting, we textend a welcome that we hope will be of such cordiality that you will never again miss a Utica Meeting

Utica has much to offer to you to make your visit enjoyable You will be stimulated by a scientific program which will be quite different from anything ever held before The tendency to the emphasis of specialism at the expense of general practice will be discouraged, and there will be many meetings of general interest which all members will attend For the specialists, on the other hand, there will be section meetings as of old, but less intensive and less numerous The effort will be made to reach that happy medium between the meeting of general sessions of a generation ago and that of purely special sessions of the last decade We will serve you all regardless of your tastes, and we will make the meeting more than ever a true communion of the physicians of the State

The Beautiful Mohawk Valley

Do you love a beautiful country? Utica prides itself upon its scenery Lying at the head of the scenic Mohawk Valley with the Adirondacks almost at our door to the north, with Richfield Springs and Cooperstown with its gorgeous Otsego Lake, the Glimmer glass of Cooper's novels, to the south, and Oneida Lake to the west, with hills rising fifteen hundred feet from the river within a distance of a dozen miles, the drives about Utica are a continual joy to the nature lover

Between these high hills lie some of the most beautiful valleys in America The Boonville Gorge, West Canada Valley, Ilion and Frankfort Gorges are beauty spots of national renown and are all within an hour's run of Utica All, too, have splendid State Roads running their entire length Visiting members would do well to stay over a few days to take advantage of the opportunity of seeing these beauty spots

A Country of Historic Interest

Do you like to browse about historic spots? The vicinity of Utica fairly teems with history The home of the Oneida Indians of the Iroquois confederacy, the Sacred Stone of the Oneidas rests upon a pedestal in Forest Hill Cemetery, and the stone marker on the slope of College Hill in Clinton shows the point beyond which, according to the Treaty of Fort Stanwix, the white man was never to encroach upon the domain of the Indian

It was through the Mohawk Valley and past Utica that Lord Geoffrey Amherst marched his army during the French and Indian war, captured Montreal, and brought all Canada under the British Crown

Between Utica and Albany, along the Valley of the Mohawk, are many points of vital interest to the student of Colonial and Revolutionary History The homes at Johnstown and Fort Johnson of that truly remarkable man, Sir William Johnson, the man who had complete charge of all Indian affairs in North America for the British Crown, homes halt baronial mansions, half frontier fortresses, and now in perfect state of repair and used as historical museums, are well worthy of a stop over or a detour by any member coming from the east The old Fort Van Alstyne at Canajoharie and the ancient church at Fort Herkimer hold many historic associations

The Battle of Oriskany

The especial interest of the student of the annals of the war of Independence, however, center around the names of General Herkimer, Fort Stanwix and the Battle of Oriskany Each year as the historians delve deeper into the Revolutionary History of the Mohawk Valley, they become more and more impressed by the tremendous significance of the campaign which culminated at Oriskany upon the outcome of the Revolutionary War

When Burgoyne came down from Canada via Lake Champlain and Lake George his expedition was but a part of a threefold move to crush the American Forces, for cooperating with him were to be General Clinton's army and navy coming up the Hudson from New York, and the British troops, tories and Indians under St Leger, Sir John Johnson and the Indian Brant, who were to come from Oswego, march down the Mohawk Valley, laying waste the great wheat fields which supplied the Continental Army with bread These three armies were to meet at Albany, cut the colonies in two and end the Revolution If this manoeuvre had succeeded, the Revolution would have failed and the United States might never have existed as an independent country

St Leger with his Indians arrived before Fort Stanwix, the site of the present city of Rome, a fort built to guard the head of navigation of the Mohawk and the short carry to Fish Creek which leads to Oneida Lake, and via the Oswego River to Lake Ontario, and layed siege to it The intrepid Gansevoort and Willett held the fort against the besieging forces and it was from these ramparts in this engagement that the newly adopted flag, the Stars and Stripes, was first flown in the face of an enemy General Nicholas Herkimer gathered the militia from the valley

at his homestead just below Little Falls (now maintained as a museum), marched up the valley, crosed the Mohawk at the ford at the foot of Genesee Street in Utica, the ford at an earlier date guarded by Old Fort Schuyler, and was ambushed by the British and Indians a few miles west of here in a deep valley in the bloody battle of Oriskany The advance of the British was checked and they again retired to their camp before Fort Stanwix This was one of the fiercest and bloodiest battles of the Revolution General Herkimer, severely wounded, was propped against a tree and continued to direct the battle, winning the victory, but succumbing a few days later from his wounds at his home below Little Falls

A few days later General Benedict Arnold, at the head of an army of Continentals, came up the Mohawk, relieved the siege of Fort Stanwix, and drove St Leger back to Canada

Many historians believe that the Battle of Oriskany was really the decisive battle of the Revolutionary War, for, if Herkimer had not stopped St Leger at Oriskany, nothing could have prevented his combining with Burgoyne and Clinton and crushing the Colonies When word arrived that St Leger was defeated, Clinton returned to New York and Burgoyne was left to his fate at Saratoga The battle of Oriskany is often spoken of as the "Battle That Made Saratoga Possible"

Of Geologic Interest

Is your hobby perchance geology? You could spend months in the neighborhood of Utica and ever make new discoveries From the days of the Granville Seat to the Glacial Period nearly every geological era is represented in Oneida and Herkimer Counties Little Falls alone is a Mecca of geologists the world over, the fosils of Trenton and Holland Patent are world famous, and if you are interested in glacial kames, moraines, drumlins, scourways, channels, deltas and beaches, you can see them of every known variety wherever you look

Utica's Hospitals

Are you interested in visiting hospitals? We have many and varied, and they will all welcome you with open arms The oldest State Hospital in the State and the newest are both at Utica, for while within the dignified walls of the Utica Etate Hospital in the city linger the memories of such great psychiatrists as Amaria Brigham, John P Gray and G Alder Blumer, whereas for fifty years the American Journal of Insanity was published within its walls and many of the world's great advances in the care of the insane have been worked out here since its foundation in 1843 The new Marcy Branch, six miles west of Utica, is as far as it is finished, the very last word in modern efficiency and incorporates all that is latest in methods and equipment Both the Utica State and the Marcy Branch are under the superintendency of Dr Richard H Hutchins, who extends a cordial invitation to all members of the Society to visit the institutions while in Utica.

In our five general hospitals, the Utica General Hospital opened in 1858 and operated by the city St Elizabeth Hospital founded in 1866 by the order of St Frances and for the past ten years occupying its splendid building on upper Genesee Street, St Luke's Hospital, under the auspices of the Protestant Episcopal Church, founded in 1867 and since 1895 occupying its fine building, the gift of Mrs Frederick T Proctor, Faxton Hospital, opened in 1875, to which four years ago was added a new wing, doubling the capacity of the hospital, in which an entire department is devoted to compensation cases, and lastly the Utica Memorial Hospital, started in 1895 as the Utica Homeopathic Hospital, which changed its home to a modern building in 1917 and its name to a modern name in 1927, visitors will find much to interest them and will be cordially welcomed.

If you are a Mason, you will want to visit the New York State Masonic Home at the eastern entrance of the city and see the million dollar Soldiers and Sailors Memorial Hospital of that institution built by Masons of New York State since the World War, and the other extensive new building now under construction in that model institution

Would you like to see the last word in county Tuberculosis Hospitals? Oneida County is now building a new one hundred bed Sanitarium on the Deerfield Hills one mile north of Utica, which though not yet ready for occupancy is far enough advanced so that one may get many ideas from it on modern hospital construction

Dinner Entertainment by the Players

And lastly do you like to be amused? Think back twelve years ago to the entertainment accorded you at Utica! Do you recall that we omitted the formal dinner and gave you a "cabaret" instead? Do you remember how your sides ached at Otto Weiskotten's monologue and Hume Baldwin's impersonations? Well this year we are going this one better We are going to have a dinner to satisfy the inner man, but a dinner without a speech! The after dinner program will all be entertainment For Utica is fortunate in having "The Players," one of the most successful amateur dramatic organizations in America with over 1,300 members Its president this year is a physician How's that for luck! And many of our physicians are active as actors, singers or musicians The entire resources of this organization, professional coach, sceneries, properties and actors, will be at the disposal of our Society to make the post prandial entertainment a memorable affair It is proposed to give you the Doctors' Opera, which was received with such storms of applause by the American College of Surgeons two years ago The

real title of this is "The Pirate's Bride" but it is called the "Doctors' Opera" because the words were written by one Utica physician, the songs by a second and the music by a third while a fourth orchestrated it Reminiscent of Gilbert and Sullivan this opera is good, real music, catchy songs and sparkling lines As your nearest F A C S The Players' Orchestra, composed largely of physicians and their families will dispense sweet music This promises to be an evening of rare enjoyment and well worthy of a trip to Utica alone Remember the dinner, a dinner without a speech, but with loads of fun

The Ladies

Again let us urge you bring your wives with you We promise them a delightful time, as the committee on entertainment of the ladies is planning a most enjoyable time for all The plans have not crystalized at this writing but suggestions submitted include trips to the scenic and historical points in the neighborhood if the weather is favorable, and bridge and teas if it is not Then, too, your wives will not want to miss that dinner and the elaborate entertainment that will follow it

Arrangements for Meetings

The arrangements for the meeting in Utica include the use of three hotels which are almost adjoining The headquarters for the House of Delegates and the annual dinner will be in the Hotel Utica, the headquarters for the members and the commercial and scientific exhibits in the Hotel Martin, two hundred yards east, and the scientific sections distributed beween these two and the Hotel Majestic, next door west of the Hotel Utica While these hotels are in the heart of the city, they are conveniently situated for parking automobiles, as the Hotel Martin is located on and the other two are but a few rods from the new wide boulevard, Oriskany Street, which has replaced the old Erie Canal There are numerous public garages all about the hotels, the newly completed Ramp Garage connecting directly with the Hotel Utica

T Wood Clarke M D,
Chairman, Sub-committee on Publicity

PUBLIC RELATIONS COUNTY SURVEY NO 7—GREENE COUNTY

Greene County is one of the smaller counties of the state having a population of about 30,000 and is strictly rural, there being no cities in the county, and only one village with a population in excess of 5,000

The county is roughly divided into two parts by the Catskill Mountains, practically seven towns being in the mountain district, and seven in the river district There are no hospitals or permanent clinics in the county with the exception of a small emergency hospital in Tannersville one of the mountain towns This emergency hospital is in a building that was once a residence and is maintained by the community A nurse is in charge, but no interne or resident physician is employed Only emergency work is done there

In Catskill the largest village of the county there is a fund of approximately $50,000 which was a bequest left for the specific purpose of establishing a memorial hospital This fund is in the hands of a committee composed entirely of laymen who are inactive, and it is not known when action will be taken to increase the funds The committee proclaim that they do not wish to start the establishment of a hospital until $250,000 is available They frankly state that they have no plan to raise this amount The medical men of the county do not feel that it is their responsibility to do so, as the burden of carrying on the work after it is established will be theirs

A beautiful site overlooking the Hudson has been donated by a public spirited citizen There is ample room for the building of a small hospital on this site and plenty of room for additions as may be needed There is no doubt in the minds of many of the physicians that a small hospital of 20 to 25 beds could be erected on the site, and would be large enough for the present

Recently it has become known that a lately deceased citizen has left his residuary estate estimated at about $5,000 to the hospital committee for the use in the maintenance of the hospital when erected

What is really needed by this hospital committee is help and advice from those who are familiar with planning, erecting and equipping small hospitals and the proper way to go about raising the necessary funds

The County Medical Society is an active organization and is composed of almost 100 per cent of the physicians in the county Meetings are held regularly every quarter and attendance averages about 40 per cent Of the 28 physicians in the county 13 are Health officers and all are active in promoting Public Health work Recently they have acquired a new idea in regard to their duties as leaders in preventive medicine and public health work

The County Medical Society has sponsored the movement for the immunization of children against diphtheria and since 1925 this work has been going on actively and a large number of school and pre-school children have had injections. It is still being prosecuted vigorously

Chest clinics and orthopedic clinics are held regularly in the county several times a year, and due to the efforts of the County Medical Society,

are on a purely consultation basis, no one being admitted to the examinations without being referred by their physicians or the Health Officer Recommendations as to treatment as well as the diagnosis are given the attending physician only, and such treatments as may be indicated are given out by him In this manner the attending physician has full control of his patient, and this way has proven much more satisfactory than the old method

The principal lay organization of the county is the Greene County Tuberculosis Committee, a branch organization of the State Charities Aid Association This committee is officered by laymen, and the organized medical profession has not taken an active part in its working A county Tuberculosis nurse was employed by and paid out of funds raised by the Christmas seal sales A few years ago the Board of Supervisors agreed to pay her salary and expenses, and have done so until the present time She worked for the Tuberculosis committee and was paid by the County This continued until about January 1st, 1928, when the County Medical Society advocated and recommended the employment of two Public Health Nurses to be under the control of a committee appointed by the Board of Supervisors in accordance with the State Aid to Counties Law, and this has been done.

The activities of the County Tuberculosis Committee since the employment of the two Public Health Nurses have been confined to the helping in the anti-diphtheria campaigns and the providing of necessary food and supplies for families in which the head of the household has been sent to sanatoriums

There is a Child Welfare Committee whose activities are county wide, and supported by the county and directed by a committee appointed by the Board of Supervisors They employ a social worker and are very active No physician is officially connected with the Child Welfare Committee

School physicians are sponsoring lectures on Sex Hygiene to the High School boys and girls The lecturers are furnished by the State Department of Health, and are a high grade type of men and women

The Rotary Club of Catskill is active and interested in the boys particularly, and have provided aid and assistance to crippled boys

Parent Teachers Associations are in various towns of the County and are willing and ready to co-operate with the physicians, and frequently seek their advice

---

FINAL LEGISLATIVE BULLETIN APRIL 29, 1929

The Governor's thirty-day period for signing bills has expired and we are in a position, therefore, to issue our final bulletin Of the 3417 bills submitted to the legislature this year, we found 134 of them to have some bearing upon the practice of medicine Although we were not able to send copies of the bills to the chairmen as extensively as we did in former years, nevertheless we carefully read every one of these bills, studied their amendments, conferred with the chairmen of the committees to which they were referred, and sometimes appeared before the entire committee in their interest

We are happy to report that our relations with the legislators were, without exception, most cordial Our many conversations with individual legislators frequently demonstrated to us the activity of the physicians of their districts Not a few told us of messages they had from physicians of their districts, soliciting their interest in certain particular bills We have ample reason to know that the prompt activity of the county chairmen most effectively nipped the chiropractic bud

Following is a list of the bills enacted into law, with their chapter numbers

Senate Int. No 87—Burkard—Assembly Int No 186—Gallagher, amending the Civil Practice Act by providing a subpoena requiring production of hospital records must be served at least one day before day fixed for production thereof, has become Chapter No 339

Senate Int No 121—Webb, Assembly Int. No 327—Rice, amending the Education Law by providing funds may be appropriated for assistants to director of school hygiene, such assistants to be appointed by district committee, has become Chapter No 126

Senate Int. No 182—Fearon, Assembly Int No 628—C. P Miller, amending the Workmen's Compensation Law by classifying as occupational diseases to be compensated for, injuries from radium, radium emanations or x-ray, has become Chapter No 64

Senate Int. No 204—Patrie, Assembly Int. No 317—Hutchinson, amending the County Law so as to permit contracts for maintaining in a county hospital tuberculosis patients from another county, has become Chapter No 12

Senate Int. No 323—Williams, Assembly Int. No 416—Lattin, amending the General Business Law by providing that provisions for licensing employment agencies shall not apply to incorporated alumnae associations of registered nurses, has become Chapter No 164

Senate Int No 333— Fearon, Assembly Int. No. 561—Shonk, enacting Public Welfare Law as chapter 42, Consolidated Laws, and repealing certain laws, has become Chapter No 565

Senate Int. No 370—Webb, Assembly Int. 544—Rice, relative to children with retarded mental development, has become Chapter No 258

Senate Int. No 402—Pitcher, Assembly Int. No 596—Lattin, amending the Health Law relative to duties of health officers, among other things duty of examining school children being eliminated, has become Chapter 372

Senate Int. 407—Pitcher, Assembly Int No 626—

Lattin, authorizing the establishment of sewer rents in any village which has a sewer system, including some form of sewage treatment plant, has become Chapter 225

Senate Int. No 408—Pitcher, Assembly Int. 623—Lattin, amending the Health Law relative to orders by health commissioner to protect water supplies, by striking out the word "emergency' has become Chapter No 374

Senate Int. No 410—Pitcher, Assembly No 622—Lattin, authorizing the establishment of sewer rents, has become Chapter No 678

Senate Int. No 411—Pitcher, Assembly Int. No 625—Lattin, providing that when Commissioner of Health appoints a health officer, he shall be qualified as "provided by regulation of public health council," has become Chapter No. 376

Senate Int. No. 466—Pitcher, Assembly Int. No 679—Lattin, making compulsory vaccination law apply to any city of 50,000 or more inhabitants instead of cities of first and second class, and relative to reports of physicians, has become Chapter No 140

Senate Int. No 467—Pitcher, Assembly Int. No 680—Lattin, relative to the suppression of rabies, has become Chapter No 375

Senate Int. No 554—Quinn, Assembly Int No 775—Nugent, New York Charter, empowering commissioner of water supply, gas and electricity to require any company selling water in city to determine whether it is healthful, safe and proper for consumption and whether furnished in quantity and at pressure adequate for fire protection, cross connections between such system and the city's water system to be made if commissioner finds it necessary, has become Chapter No 452.

Senate Int. No 646—Williams, amending Mental Hygiene Law relative to admission to institutions for mental defectives on certificate of physician or psychologist or on voluntary application, has become Chapter No 172

Senate Int. No 813—Wales, Assembly Int. No 1132—Whitcomb, requiring asylums, almshouses, hospitals, orphanages and schools in cities and other municipalities having central fire alarm station, to be equipped with fire alarm boxes, has become Chapter No 141

Senate Int. No 891—Brown, Assembly Int. No 784—Goodrich, providing for a psychiatric clinic at Sing Sing Prison, has become Chapter No 242.

Senate Int. No 1015—Brown, Assembly Int. No 1361—Esmond, creating temporary commission to study the mineral springs at Saratoga so as to further develop them for health purposes, has become Chapter No. 668.

Senate Int. No 1032—Downing, Assembly Int. No. 1325—Alterman, amending the State Charities Law, dividing cost on 50 per cent basis of maintaining and treating children in the state orthopedic hospital for children between state and county in which child resides, where cost has not been paid by parents or other persons, has become Chapter No 516

Senate Int. No 1105—Webb, Assembly Int. No 1473—Rice, providing for termination of medical licenses issued to citizens of a foreign country, who have failed to become a citizen of this country within ten years, instead of six years, has become Chapter No 262

Senate Int. No 1108—Webb, Assembly Int. No 1500—Rice, relative to the care and treatment of physically handicapped children, has become Chapter No 571

Senate Int. No 1122—Pitcher, Assembly Int. No 1493—Lattin, authorizing the health commissioner to issue certificates of approval covering laboratory examinations and tests as state sanitary code may require to be made therein, has become Chapter No 368

Senate Int. No 1123—Pitcher, Assembly Int. No 1472—Lattin, amending the Health Law by abolishing general health districts and providing for county health districts, has become Chapter No 371

Senate Int. No 1274—Baumes, Assembly Int No 1563—Dominick, authorizing the establishment of an office of town physician in any town containing a village, whether incorporated or not, has become Chapter No 352.

Senate Int. No 1311—Pitcher, Assembly Int. No. 1590—Lattin, relative to embalming and undertaking, has become Chapter No 370

Senate Int No. 1390—Gates, Assembly Int. No 1764—Cornaire, amending the Workmen's Compensation Law by adding certain additional diseases to list of occupational diseases for which compensation may be had, has become Chapter No 298.

Senate Int. No 1410—Gates, Assembly Int. No 1786—Cornaire, amending the Workmen's Compensation Law by providing for consecutive awards for total or partial loss or loss of use of more than one member or parts of members, has become Chapter No. 301

Senate Int. No 1520—Brown, amending the Health Law relative to the suppression of certain nuisances, has become Chapter No 373

Senate Int. No 1563—Mastick, creating a temporary commission to investigate and study so as to ascertain most practical and efficient method of providing security against old age want, and appropriating $25,000 00, has become Chapter No 664

Assembly Int. No 566—Dickey, making it a felony to sell or distribute habit forming drugs, imprisonment not to exceed ten years, has become Chapter No 377

Assembly Int. No 948—Berg, empowering the Regents to indorse certificate of rehabilitation of U S Veterans' Bureau as a license to practice any of the professions regulated by the Regents, has become Chapter No 265

In closing, may we suggest that you find occasion, at your earliest convenience, to express to your Senators and Assemblymen the appreciation of the State Society for the loyal support they have given us

HENRY L. K. SHAW,

GARRETT W. TIMMERS,

Committee on Legislation, Medical Society of the State of New York

SECOND ANNUAL GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

The New York Academy of Medicine has arranged for a Second Annual Graduate Fortnight to be held during the period October 7 to 19, 1929 The subject which has been chosen is "Functional and Nervous Problems in Medicine and Surgery"

It is believed that this year's subject will attract not only the medical profession generally but also social workers and those especially interested in public welfare The field includes those functional disturbances which have been much neglected in the last thirty years in comparison with the structural disturbances of the human body

Evening sessions will be held at the Academy at which well known authorities will discuss many phases of the general subject

Afternoon special clinics and demonstrations will be presented in the following hospitals

Babies' Hospital	Montefiore Hospital
Bellevue Hospital	Mount Sinai Hospital
Fifth Avenue Hospital	Post-Graduate Hospital
Lenox Hill Hospital	Neurological Institute

New York State Psychiatric Hospital

The following is the program of the lectures to be given at the evening sessions in the Academy building

First Week

October	7	Opening addresses	Dr Livingston Farrand, President, Cornell University Mr Clifford Beers, Secretary, The National Committee for Mental Hygiene Dr Ludwig Kast, Professor of Medicine, N Y Post-Graduate Medical School
"	8	The involuntary nervous system	Dr W Langdon-Brown, Physician, St Bartholomew's Hospital, London
		Hysteria as a practical problem	Dr C Macfie Campbell, Professor of Psychiatry, Harvard University
"	9	Neuroses following accident	Dr Foster Kennedy, Professor of Neurology, Cornell University
		Post-operative emotional disorders, their prevention and management	Dr Robert B McGraw, Assistant Physician, Presbyterian Hospital
"	10	Endocrines and the vegetative system	Dr Walter Timme, Attending Physician, Neurological Institute
		General survey of visceral neuroses	Dr Leopold Lichtwitz, Professor Internal Medicine and Chief of Medical Department, Municipal Hospital, Altona, Germany
"	11	Metabolism and the vegetative nervous system	Dr Anton Julius Carlson, Professor of Physiology, University of Chicago
		Headache and migraine	Dr Frederick Tilney, Professor of Neurology, Columbia University

Second Week

October	14	The cardiac neuroses	Dr Robert H Halsey, Professor of Medicine, N Y Post-Graduate Medical School
		The vascular neuroses	Dr Israel Strauss, Attending Neurologist, Mount Sinai Hospital
"	15	Gastro-intestinal neuroses	Dr Burrill B Crohn, Associate Physician, Mount Sinai Hospital
		The surgery of the vegetative nervous system	Dr Alfred W Adson, Assistant Professor of Surgery, University of Minnesota (Mayo Clinic)
"	16	Habit and behavior problems	Dr Herman M Adler, Director, Institute for Juvenile Research, Chicago
		Neurocirculatory asthenia	Dr Marcus A Rothschild, Associate Physician, Mount Sinai Hospital

"	17	Carpenter Lecture—The function of the emotions in the production and prognosis of diseases	Dr Charles P Emerson, Professor of Medicine, Indiana University
			Dr Carl Pototzky, Director, Children's Clinic, Kaiserin Augusta Victoria Hospital, Berlin
		Insomnia and disturbances of sleep	Dr Louis Casamajor, Professor of Neurology, Columbia University
"	18	The psychoneuroses	Dr William A White, Director, St Elizabeth's Hospital, Washington
		Psychotherapy	

KINGS COUNTY

Resolution Adopted at the Regular Meeting of Medical Society of the County of Kings on March 19, 1929

"WHEREAS, Year after year bills have been introduced in the New York Legislature providing for a change in the public policy of the State with relation to birth control, either by repealing Sec. 1142 of the Penal Law which defines articles and appliances, etc, for this purpose to be obscene and providing punishment for their sale, distribution or use, or by the repeal of Sec. 170-d of the Public Health Law which forbids doctors violating the provisions of Sec 1142 of the Penal Law or abusing the privileges accorded them by Sec. 1145 of the Penal Law, and

"WHEREAS, The New York City Federation of Women's Clubs sought, by questionnaire, to secure endorsement of a birth control bill in the 1929 Legislature from members of the medical profession and boasted of a number of affirmative replies, and

"WHEREAS, It is reasonable to believe that effort will be made to secure endorsement of a birth control policy at the 1929 meeting of the Medical Society of the State of New York,

"THEREFORE BE IT RESOLVED, That the Medical Society of the County of Kings, in meeting assembled March 19th, 1929, reiterating its opposition to any change in the public policy of the State which will modify or nullify Sec. 170-d of the Public Health Law or Sec. 1142 of the Penal Law, or that will amplify the privileges contained in Sec 1145 of the Penal Law, or that will write the policy of sterilization of the sick or unfortunate citizens into the Law of the State of New York, hereby instructs its Delegates to the annual meeting of the Medical Society of the State of New York to present thereat, and work for the adoption of, the following Resolution

"RESOLVED, That the Medical Society of the State of New York, in (1929) meeting assembled, declares its opposition to the introduction or enactment of any law that will change the policy of the State of New York in the matter of birth control or sterilization or so amplify the police power of the State as to threaten the money or man-power of the State, or its physical, moral or economic security, or the safety of its citizens, or to disturb the safeguards thrown about the practice of medicine in the State of New York as contained in the Medical Practice Act

"AND BE IT FURTHER RESOLVED, That copies of this resolution, in its entirety, be sent to the NEW YORK STATE JOURNAL OF MEDICINE and to the public press with a request of this body for publication, to the Medical Society of the State of New York with the request of this body for the adoption of the contained resolution, and (by the Secretary of this Society), to be sent in December, 1929, to the Governor of this State and to the presiding officers of the Senate and the Assembly of the 1930 Legislature,

"AND BE IT FURTHER RESOLVED, That copies of this Resolution be sent to every County Medical Society in the State of New York with the request of this body that they take similar action to the end that a united front may be presented against those who may seek to make the medical profession the agency of lust and sadism through birth control and sterilization

SECOND ANNUAL GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

The New York Academy of Medicine has arranged for a Second Annual Graduate Fortnight to be held during the period October 7 to 19, 1929 The subject which has been chosen is "Functional and Nervous Problems in Medicine and Surgery"

It is believed that this year's subject will attract not only the medical profession generally but also social workers and those especially interested in public welfare The field includes those functional disturbances which have been much neglected in the last thirty years in comparison with the structural disturbances of the human body

Evening sessions will be held at the Academy at which well known authorities will discuss many phases of the general subject

Afternoon special clinics and demonstrations will be presented in the following hospitals

Babies' Hospital	Montefiore Hospital
Bellevue Hospital	Mount Sinai Hospital
Fifth Avenue Hospital	Post-Graduate Hospital

MEDICAL WARES

BACILLUS ACIDOPHILUS MILK

Fermentation and putrefaction take place in every human intestine. Some of the bacteria which grow in the intestine are harmful, but harmless and even beneficial kinds may also grow under variable conditions of food, peristalsis, secretion, and the general health

The predominating bacteria of the human intestine are those of the putrefactive type, including the colon group One characteristic of the colon group is the production of gas These bacteria also cause putrefactive changes in the food in the intestine, resulting in the formation of toxic substances and usually associated with the foul odors of protein decay

The kinds of changes produced by colon bacilli and other bacteria in the intestinal contents are similar to those which would occur in the same substances outside of the body The intestine is a test tube and an incubator containing an abundant supply of food and water at a temperature best suited to the growth of the living organisms The actions which take place in this natural test tube are dependent upon the conditions under which the bacteria grow An excess of meat in the diet, for example, is likely to initiate an abnormally great degree of putrefactive change, an excess of sugar or starch leads to other undesirable changes, while the slowing of peristalsis permits the bacteria to act upon the intestinal contents for an abnormally long time Abnormal bacterial action is also likely to produce inflammatory changes, and the mucus which is formed may envelop and protect the offending bacteria. The abnormal process, once started, is likely to be persistent and self-perpetuating

The changes in the intestinal contents, the factors which produce them and their clinical effects are extremely complex and difficult to recognize and identify, but the general principle of their prevention and treatment are well known. The therapeutic measures fall into four groups

1 Intestinal antisepsis
2 Catharsis
3 Diet.
4 Bacteriological control.

It was formerly thought that the gastric juice had antiseptic properties which would destroy bacteria passing through the stomach, but these properties are not present between meals or when the juice is diluted with food Cathartics speed up peristalsis, and thus help to remove putrefying substances A control of diet is always essential in the prevention or treatment of intestinal disorders caused by bacteria Every culture medium must be uniform from day to day in order that the physician may estimate the value of the several elements entering into the growth of bacteria

Many attempts have been made to discover a kind of harmless or beneficial bacteria which will grow in pure culture in the intestine to the exclusion of other bacteria Milk soured by the various forms of Bulgarian bacilli have been used for this purpose, and cultures of bacteria have been put up in tablet form or in liquids to be taken by the teaspoonful But clinical experience has demonstrated that proper bacteria must be introduced into the intestine continuously and in overwhelming numbers Extensive research has shown that acidophilus bacilli are the first to appear in the intestines of new-born children, and that in normal babies the acidophilus bacilli continue to predominate over all other forms of bacteria Experiments have shown that the same kinds of bacteria may be made to grow in the adult intestine in approximately pure culture, and that, when they grow, other kinds of bacteria are greatly lessened in amount or even disappear Clinical experiments demonstrate that intestinal toxemia ceases when the bacillus acidophilus becomes the predominant organism of the intestine

Acidophilus bacilli are sold in the form of bottled milk in which the bacteria have been grown in pure culture The milk is first sterilized by heat, and then a pure culture of the bacilli grown in milk is added. The inoculated milk is allowed to stand at body temperature for several hours while the bacteria multiply The cultured milk is then bottled and stored at a temperature of 40° F. It will then keep for days without further change occurring

Acidophilus milk is of a creamy consistency from the coagulation of casein in fine particles It contains lactic acid from the fermentation of some of its milk sugar It is therefore an ideal food, but its peculiar value is that it supplies the intestine with living bacteria in numbers far greater than can be supplied in any other way A pint of acidophilus milk will supply the body with more bacteria than will a pint bottle of tablets or a liquid culture. The overwhelming number of bacteria is one great element in the value of the milk.

The production of acidophilus milk of a reliable and uniform quality requires that a skilled bacteriologist shall supervise every stage of its production, and that a bacteriological laboratory shall be immediately available for testing the product almost hourly Acidophilus milk is a pharmaceutical product as well as a food, and it is reliable and effective in proportion to the scientific care with which it is produced

LONDON LETTER

REPORT OF MEDICAL RESEARCH COUNCIL

Each year at this time the medical profession awaits with the greatest interest the Report of the Medical Research Council This body has gradually gained for itself the position of Headquarters Staff of the forces of research of the British Empire, and its annual Report gives a faithful picture of the year's progress Speaking of radium, the Report says that the outlook has been quite transformed in the last seven years There is now a widening circle of real interest in radium therapy among surgeons It is already possible to say with confidence that any women suffering from early cancer of the neck of the womb can have the disease locally removed by a course of radium treatment as surely as by the knife, and of course with less suffering and risk It has already proved to be the best means of treating inoperable cancer of the mouth and tongue, and in the operable cases it seems that it will soon replace excision Similar confidence is rapidly gaining ground in respect to cancer of the breast and the rectum

In view of the continued mortality from puerperal sepsis to which I referred in a previous letter, the researches of Dr Burt White are of much interest and importance On examining 100 prospective mothers he found that there was a close correlation between a Dick positive result and subsequent puerperal sepsis A further 1000 cases are to be tested to decide the wisdom of rendering Dick positive subjects immune to puerperal sepsis before labor

The Medical Research Council Report on the value of ultra-violet light has caused a real flutter in the dovecot The Report states that in certain forms of surgical tuberculosis this method of treatment has real value, but, as a result of an investigation carried out under the Council's authority, it is pointed out that the ultra violet light has no greater value to healthy growing children than can be obtained much more cheaply and safely by a proper diet, and a penny-worth of cod liver oil will provide more vitamin D than three or four shillings worth of ultra violet light It may well be imagined that such a report has led to a good deal of correspondence. "Sunshine in the home" had seized upon the imagination of the man—and woman—in the street, and a mild sort of craze had arisen which, naturally, was exploited by manufacturers of sunlight lamps and the legions of quacks Advertisers implored all and sundry to instal the sunlight lamp in the bathroom and live happy ever after Children were subjected in droves to the action of the rays in the hope that they would thrive mightily and be free from all the minor ailments of juvenescence. And now—happy mothers gleefully watching their children getting beautifully brown all over are confronted with a Report, issued with all the authority of the Medical Research Council, showing that they might as well give Tommy a penny-worth of cod liver oil or put a mustard plaster on his little chest Shall we parody Horace?

Eheu, fugaces, Postume Postume
Alas that dear sunlight is lost to me, lost to me
Nobody knows what she was to me, was to me
Or all the pain she has cost to me, cost to me
Eheu, fugaces, Postume Postume

CONFERENCE ON RHEUMATISM

Last Spring I attended as a delegate a great Conference on Rheumatism held at the ancient watering-place of Bath, in Somerset Bath has been pre-eminent as a curative centre for rheumatic affections since the days of the Romans, and assuredly no better place could have been chosen for the Conference Many nations sent representatives, and to myself—a surgeon—uninitiated into the mysteries of this hydra-headed disorder, it seemed amazing that so much should be known about its cause and its protean manifestations and so little about its cure But the Conference was of great value, and arising out of the interest which it awakened, a curative centre on a large scale is to be started in London in the near future by the British Red Cross Society One of London's historic churches, the Regent's Park Chapel—built by Nash (the creator of Regent Street) has been empty for seven years and has now been acquired by the Red Cross and altered and equipped at a cost of £40,000 It is estimated that approximately 12,000 patients will be treated annually How great is the need for such a clinic is seen in the Ministry of Health Report on "Incidence of Rheumatic Diseases" It seems that nearly one-sixth of the industrial disability in the country is due to diseases classed as Rheumatic and £2,000,000 is spent yearly in sick benefit This is a real step in a national campaign against rheumatism and we may well hope that if this clinic proves successful it will be the forerunner of many similar clinics throughout the country

H W Carson, F R C S

"That college standing has the highest rating is to be explained by the fact that college standing affords a fair test of what a student has been able to do with past opportunities It is, however, a little unexpected to find book ability and health rated comparatively low Creative ability is naturally deserving of high consideration in the making of a scientist So is intellectual honesty, for in that term is included the most important of all qualifications for a true scientist, who must be able to regard facts dispassionately and objectively, regardless of what they prove or disprove, even though it be some theory of the observer or some hypothesis of common acceptance It is interesting to see that character is rated above enthusiasm and perseverance and that these in turn are rated above conduct

"The qualities scheduled in the test do not, of course, constitute genius of themselves, they are merely symptoms by which the existence of genius may sometimes be diagnosed Nor should the decimal places be too highly regarded Professor Gordon is not likely to fight for one-tenth of 1 per cent in 'book ability' He would welcome anybody who received a mark of 7 2 in this quality"

REGULATING THE SALE OF EYEGLASSES

The following editorial in the *Brooklyn Daily Eagle* of April 23, upholds the statute recently enacted requiring that eyeglasses may be sold only on the prescription of a regularly licensed physician or optician

"The general disposition of the Supreme Court to extend the 'police power' of States, so strikingly indicated in the Emergency Rent Law decision, appears again in the ruling that the State of New York has the right to regulate the sale of eyeglasses and spectacles by insisting that at the place of sale a duly qualified physician or optician shall be present and responsible for the proper sort of glasses sold in any particular case This provision (Chapter 379 of the Laws of 1928) was carried to the Federal Court of last resort, because some dealers held it to be unconstitutional

"On the whole, the sustaining of the State law is, we think, in the public interest Especially in an age when the use of glasses for the rectification of eye infirmities by even young children is common and has full medical and surgical sanction, the retail sale of glasses by dealers offering bargain prices is unquestionably dangerous Even persons of high education cannot pass on the value of a particular sort of lenses for a given case The masses are entirely at sea They need to be protected from themselves

"The human eye is a delicate thing to fool with The best doctors and the best opticians make mistakes To reduce mistakes to a minimum would seem to be a proper aim of modern legislation"

DIET AND MORALS

What the editor of the New York State Journal of Medicine says about health is seldom considered to be news, owing to quantity production, but what Henry Ford says about any phase of health attracts immediate notice—for a time. The New York Times of May 10 contains a report in which Mr Ford suggests that dieting should be taught by clergymen because of its effect on character and morals The article reads

"Some day people will learn how to eat, and there will be no more hospitals, is the declaration of Henry Ford in calling upon the clergy of America to make right eating part of their religious teaching Mr Ford's views on eating are published in an interview in the June issue of The Red Book Magazine, and are declared to be his first comments on his experiments on foods

"Mr Ford asserts that most crimes and wrongful actions are 'the result of wrong mixtures in the stomach' Illness will vanish and crime diminish, Mr Ford thinks, when people apply a knowledge of right food combinations in their daily life.

"'If people would learn to eat the things they should eat, there would be no need for hospitals,' he says 'Jails and prisons would have less to do What greater mission can the clergy have than the elimination of sickness, jails and prisons?'"

That physical states affect the mental there can be no doubt. One physician wrote a sermon on the subject, "The physical basis of spirituality," and preached it effectively from several pulpits during an anti-tuberculosis campaign But diet and tuberculosis are only two among numberless physical conditions which must be corrected before man reaches a state of perfection either physical or spiritual

THE DAILY PRESS

PREPARATION FOR RURAL PRACTICE

The *New York Times* of April 11 has the following editorial description of what the Albany Medical College is doing to provide service in rural areas

The gift of Mr Lucius N Littauer to the Albany Medical College lends another hand to the effort which that institution has been making, with the active cooperation of the Rockefeller Foundation, to "strengthen the medical defenses" of the towns and villages of Northeastern New York The particular purpose of this gift of $50,000 is to bring the Gloversville Hospital into contact with the Medical College It will make it possible for the advanced students to become familiar with the problems of medical practice in that district.

"Mr Littauer has also made provisions will give opportunity for research work to specially qualified students Thus, in all these interchanges, talented men will be discovered and developed and later brought back, so far as possible, to serve the district from which they have been drawn The gist of it is that students are kept near the communities of the type where general practitioners are most needed today With the drift toward the cities, it is estimated that a third of the towns in the United States of 1,000 inhabitants or less have no doctors

"The experiment of the Albany Medical College in the region extending from the Catskill to the Canadian border and westward from the Hudson Valley up the Mohawk to Little Falls is therefore of more than local interest. The telephone and the automobile are widening the reach of the physician and the surgeon Perhaps some day the airplane will give him still wider scope for his skill But there will always be need of doctors who know rural life, who are near to it, and who are willing to give their best to it."

POSTMORTEMS ON DOCTORS' BODIES

If physicians are to obtain autopsies on their patients, they must submit their own bodies to pathological examinations after death Now and then a physician provides for an autopsy on his own body The *New York Sun* of April 23 contains the following account of such a provision

"Because he desired that his labors in the medical field should not end with his death, the body of Dr Daniel Smith Lamb, veteran curator of the Army Medical Museum, was subjected to an autopsy today under the direction of his friend, Dr Ales Hrdlicka, curator of anthropology of the National Museum

"Dr Lamb's instructions for the post-mortem, which he hoped would reveal new secrets to his profession, suggested that Dr Hrdlicka perform the autopsy, but the noted anthropologist refused because 'Dr Lamb was too dear to me,' so Major G R Callendar of the Army Medical Corps acted

"Dr Lamb, who died at the age of 86, was curator of the Army Medical Museum for fifty-five years and instructor at Howard University since 1873 He was born in Philadelphia and took his medical degree at Georgetown University In addition to the autopsy upon the body of President Garfield he had concluded post-mortems over the bodies of Vice-President Henry Wilson and many other notables"

SYMPTOMS OF GENIUS

Physicians are frequently called upon to apply the Binet tests for the determination of the lesser degrees of development of mentality, and psychologists have devised tests for the measurement of extraordinary large mental capacities These tests have come into public notice through the choice of forty-eight students for the "School for Geniuses" recently established at Johns Hopkins University for the purpose of doing special work in chemistry The qualifications adopted as indicating the likelihood of success are as follows, based on a scale of 100, according to an editorial in the *New York Sun* of May 3, are as follows

"College standing, 15 3, creative ability, 13 7, intellectual honesty, 11 0, faculty of observation, 10 1, character, 9.2, enthusiasm, 8 9, perseverance, 8 9, conduct, 7 8, health, 7 8, book ability, 7 3"

The editorial continues

"In arranging this interesting schedule Professor Gordon studied the methods of promotion and employment of nearly seventy corporations

MEAD'S DEXTRI-MALTOSE in Any System of Infant Feeding—

Suggested Formulae for 24 Hour Feedings

Fresh Cow's Milk

	Oz
Mead s Dextri-Maltose	
Fresh Cow's Milk	
Water	

Lactic Acid Milk

Mead s Dextri-Maltose
Mead's Powdered Lactic Acid Milk
Water

Protein Milk

Mead's Powdered Protein Milk
Mead s Dextri-Maltose
Water

Evaporated Milk

Mead s Dextri-Maltose
Evaporated Milk
Water

THE greater known assimilation limits of Mead's Dextri-Maltose make this form of carbohydrate most acceptable to replace the deficiency found in all cow's milk and water formulae. This is true of any system of infant feeding.

For many years physicians have used it with good results in fresh cow's milk and water modifications. Yet within recent years the milk itself has undergone various modifications or alterations for the sake of preservation. In many cases these alterations have given definite advantages over fresh milk for different conditions in infant feeding

Among such milks may be mentioned:

Powdered Lactic Acid Milk
Evaporated Milk
Powdered Milk
Powdered Protein Milk
Fresh Cow's Milk

The advantages following the use of Mead's Dextri-Maltose in fresh cow's milk and water mixtures will be present when this carbohydrate is used in any of the above milk mixtures

Use it in these formulae as you do in the feedings prepared from fresh cow's milk and water. Its addition to the infant diet in any of these milks will meet with good clinical results in the majority of cases. Its known assimilation limits assure its absorption with a minimum tax upon the digestive tract of the infant Freedom from nutritional disturbances has always been noticeable whenever it is used

MEAD JOHNSON & COMPANY

Infant Diet Materials Exclusively

Evansville, Indiana, U. S. A.

OUR NEIGHBORS

ANNUAL REPORTS OF THE OHIO STATE MEDICAL ASSOCIATION

The May first issue of the *Ohio State Medical Journal* announced the annual meeting of the State Medical Association on May 7, 8, and 9, in Cleveland, and also carried the annual reports of the committees These reports are abstracted in order that the physicians of New York State may compare them with the reports of their own officers printed in the May first issue of this JOURNAL

The first report is that of the Committee on Public Policy, whose principal activity is that of legislation The report says

"This committee has not only continued to maintain contact with numerous other groups and agencies concerned with problems of public health and scientific medicine, but has endeavored to extend contacts with still more organizations and societies in any way interested in these questions It has also been active during an unusual and most strenuous session of the Ohio General Assembly in which there were introduced more fad, cult, 'special interest, and destructive bills, than ever before

"During the session of the 88th General Assembly just closed there were no less than 167 bills and resolutions which had a direct bearing on public health, medical practice, medical education and statutory regulation of various phases of those general questions Among those, of course, were the state institutions, the custody and care of mental defectives, workmen's compensation questions, and public health functions

"Never before in any one session were there so many bills introduced by cultists and anti-medical exponents Due to the calm and conscientious judgment of the majority, these measures, while difficult and annoying, were properly defeated In fact, none of the really vicious bills succeeded in 'getting by'

"Moreover, socialistic, experimental and visionary legislation, while represented by numerous bills introduced, was notable by its absence when the final enactments were recorded As one political writer said 'The big, laudable thing about the General Assembly just ended is that it has enacted a minimum, in fact a negligible amount of legislation to rob the people of Ohio of such liberty, freedom, self-determination, and independence of thought and action in their pursuit of happiness as they still possess

"This Committee feels that medical organization has rendered a genuine public service in its available, abundant, scientific and unselfish advice and information on the many problems of legislation This committee did much preliminary work For several months in advance of the legislative session, information was assembled, prospective measures were considered and policies adopted in conformity to previous pronouncements of the House of Delegates Prior to the legislative session, on authorization of Council, this committee prepared and issued, before the session began, a pamphlet setting forth the policy and attitude of the medical profession toward legislation and governmental administration, including analyses of numerous definite issues. These pamphlets were issued to each member of the Legislature as well as to the legislative committeemen and the presidents and secretaries of the component county societies"

The Committee on Economics has studied the Workmen's Compensation Law, and says

"The medical department of the commission does not adhere blindly to the medical fee schedule, but in unusual cases when essential facts are submitted allows additional fees for special treatments It has also been found that the commission does not expect physicians to write for permission to perform operations in emergencies or where the condition of the patient might be endangered by such delay Physicians, however, are expected to obtain written permission from the commission to perform 'corrective or reconstructive' operations which are not emergencies

"It is the belief of this committee that many of the problems of the physician and the commission can be eliminated by a continuance of the present policy of mutual understanding and cooperation, and we suggest that county societies invite members of the commission to address them during the coming year for the purpose of explaining some of the problems faced by the commission and of giving each physician more information as to how the cases are handled and settled"

Regarding the cost of medical care the report says

"The attention of the members of the State Association is called to articles carried in the August, 1928, issue of the Journal, pages 607 and 608, and the October, 1928, issue, pages 795 and 796, in which the program of the national committee was analyzed in detail

"The Medical Economics Committee is intensely interested in this movement to obtain reliable data on this complex and vital question and urges the members of the State Association to cooperate with the national committee whenever called upon to do so It especially recommends that Ohio physicians give their earnest support to the

(Continued on page 639—adv xvii)

(*Continued from page 636*)

study being made by the American Medical Association on the income of physicians, one of the phases of the cost of medical care survey"

The report discusses the shortage of physicians and says

"This committee is strongly opposed to any attempt to lower the educational standards of the profession in order to increase the number of physicians and is opposed to creation of subsidies and 'state salaried medical service' to 'remedy' a situation which is believed not nearly as serious as has ofttimes been painted."

Regarding free medical service the report says

"The generosity of the profession still is being abused by those who would socialize American institutions The menace of further 'state medicine' hangs over the profession and there must be no compromise The practicing physicians must continue to combat attempts to extend free service to those in a position to pay We must oppose any move on the part of the state, corporations or institutions to invade the practice of medicine Clinics, health demonstrations, etc, have much merit if properly used to educate the public on the prevention of disease However, when created with the paternalistic idea of free service for all, these movements become dangerous, not only to the rights of the practicing physician but to the public"

The Publication Committee reports

"This committee believes that the Journal is one of the mainsprings in the activity of organized medicine in Ohio, and in conclusion urges that every physician make an effort to read and study the Journal each month One of the chief objects of the Journal is to keep the members of the State Association in touch with the activities of their colleagues throughout the state During the past year numerous news items about physicians have been published as well as scores of articles about hospitals and the activities of the public health workers in Ohio and elsewhere Each month accounts of the meetings held by the component county medical societies and academies have been recorded, and advance notices on future meetings of unusual interest have been published"

The Committee on Medical Defense says

"Recognizing that a large majority of all malpractice suits are instigated by persons seeking financial gain or hoping to avoid payment for services rendered, the Ohio State Medical Association in 1916 established a medical defense plan to protect the profession as a whole by discouraging the institution of such suits by insisting that all suits filed should be fought through to the last court if necessary to protect the physician against an unwarranted and an unjust action, and by

Ultra-Violet Combined With Heat and Light Make Possible a Wide Range of Therapeutic Uses

CLINICAL evidence and the experience of well-known authorities have shown that the new Battle Creek Super Solar Arc Lamp may be successfully used to treat a wide range of the most stubborn and deep-seated disorders

Not only does this ADVANCED-TYPE LAMP possess many improved mechanical features of construction, such as the automatic magnetic feed which prevents loss of time in waiting for the rays to attain adequate intensity, but the superiority of this lamp in the treatment of general constitutional conditions, as well as local surface conditions, is largely due to the combination of rays produced

An ample amount of ultra violet radiation plus the radiation of infra-red, results in the production of a spectrum that most closely approaches that of the sun Since the Super Solar Arc combines ultra-violet and infra-red rays it finds dozens of uses, for rachitic patients, for skin diseases, for relief of congestion, and other conditions The technic of handling this lamp is easily and quickly mastered

Our new bulletin describes fully the many mechanical and therapeutic advantages of the Super Solar Arc May we send you a copy?

Sanitarium & Hospital Equipment Co.

Battle Creek Michigan

Other Battle Creek Therapeutic Appliances

Oscillo-Manipulator

This appliance, through years of development, has become a tested substitute for hand massage It has proven of great value in practically all cases in which general or localized massage is indicated.

"Veelite" for Infra-red

This lamp radiates soft, penetrating rays of infra red. Unique features are the new V-shaped element and ease of adjustment.

Vibratory Chair

A therapeutic unit of proven value for the application of vibration in the treatment of disease. The entire nervous and circulatory systems are reached by Vibratory Chair treatment.

Solar Arc Lamp R-40

A convenient, powerful and most efficient appliance for heat, light and ultra-violet

(*Continued from page 640—adv xviii*)

The Military Committee reported that 899 Ohio physicians held commissions in the Medical Reserves, and discussed the qualifications needed for promotion

The last report is that of the Council, which says

"Council since the last annual meeting has studied many problems with a state-wide aspect and directed many activities of general interest, as reflected in the minutes of the Council meetings published from time to time in the Journal Issues containing these minutes constitute a part of this report and are as follows June, 1928, page 471, August, 1928, page 635, November, 1928, page 881, February, 1929, page 125, April, 1929, page 297"

MEDICAL LEGISLATION IN TEXAS

The April issue of the *Texas State Journal of Medicine* says editorially

"Our Legislative Program fails, at least for the present It seems difficult to place the whole blame for the failure For one thing, we, as a profession, did not work hard enough, for another, our legislation became lost in an overwhelming avalanche of projects considered of more importance by the great majority of the members of the House, many items of which aroused much intensity of feeling and much antagonism So great was the confusion and so general was the disposition to filibuster, in spots, and fits and starts, that the rather inefficient leadership of the opposition succeeded in so diverting our very good leadership that the no quorum feature of the last days of the session caught us This statement is not intended as an alibi It is an effort to put the facts of the situation in words Those who did not attend any of the sessions of the regular session of this legislature can hardly be told just what the situation was"

The editor then discusses the attitude of certain editors and legislators toward the medical profession, and reveals a state of mind which goes far to explain why physicians lack power with the lawmakers Describing several bills, the editor says

"A law was enacted requiring a three-day notice of intention to get married, before a license could be issued A layman in the legislature attached a physical examination clause, and it went through before anybody noticed it Immediately the 'medical trust' was accused of having engineered the whole affair

1927	10	9
1928	21	7
1929 (Jan to March)	3	4
Total	175	130

The Committee on Medical Education and Hospitals discussed several subjects in a general way, including interne training, postgraduate study, undergraduate medical schools, hospital nursing schools, and clinical laboratories It suggests

"Plans should be developed whereby medical students in the medical colleges of the State at the present time may receive assignments to active general practitioners in their home communities during vacation periods as a revival of and further development of a practical preceptor system"

The Committee on Auditing and Appropriations gave the financial report of the Society The Journal received $13,797 70 for advertising, and cost $17,691 10

The Committee on Periodic Health examinations discussed the examinations in a general way and said

"Naturally the members of the medical profession themselves or medical organizations as a group cannot be very aggressive in propaganda or publicity for periodic health examinations, but we can and should cooperate with official and non-official health agencies, various clubs, teachers organizations and similar groups interested in promoting public health, in emphasizing the importance of a still greater public demand for thorough diagnoses and preventive medicine from physicians"

The Committee on Mental Hygiene discussed the laws of Ohio, the building plans of hospitals for the insane, the necessity of the prevention of insanity, penal problems, and expert medical testimony

(*Continued on page 641—adv xix*)

(*Continued from page 642—adv xx*)

daughter practices chiropractic, who replied to a request for the support of an investigation into the treatment of the insane, and said

"The medical trust is the most powerful secret political organization in America They have taken away our liberty and our right to get well and stay well whether we are sick mentally or physically If we have our right mind but our physical body is all racked with disease and pain, and we go to a chiropractor and regain our health, we are lawbreakers and criminals

"Yes we need to take care of our Insane, but medicine never made an Insane man sane Remove the cause and the patient will get well The medical trust will not accept chiropractic science, because they did not start it and have not a monopoly on that mode of treatment In fact most medical men are so narrow they can't understand They don't want to understand because it ruins a lot of their theories and suppositions If you will put one Insane Hospital under chiropractic management the world will be convinced and the sick people will have a chance to get well"

JOURNAL IMPROVEMENTS

Does any medical journal fulfill the expectations of its editors and publishers? If it did, physicians would be conventionalized, and the profession, fossilized

A medical journal reflects the imperfect application of incomplete scientific knowledge, but it also reflects a continuous progress in both the theory and practice of scientific medicine Ideals are always far in advance of their practical application in medicine, as in the church and the law

The scientific department of the *Wisconsin Medical Journal* is discussed by the President of the State Society, Dr K. W Doege, in the April issue, as follows

"*The Wisconsin Medical Journal* as a scientific publication and as a medium to stimulate further medical study might be improved, and by so doing, the Journal would conform more closely to the ideals and wishes that the progressive members of the Society had in mind While its outward appearance is more elegant than formerly, its advertising pages more numerous, the personal news items longer, the reports of district and society meetings fuller and the publication itself financially self-supporting, in short, the trade interests of the profession taken care of, the scientific value of the Journal to physicians of the state could be enhanced materially

(Continued from page 641—adv xix)

"A bill requiring sterilization of those unfortunates who may become wards of the state and who may pass on their deficiencies to their offspring, was introduced, by a doctor, it is true, but the State Medical Association had nothing to do with it As a matter of fact, the demand for this legislation came principally from two special groups of laymen, and high-class laymen at that. The medical profession is interested in the proposal, and is studying it, but it is not at this time prepared to ask for the legislation.

"Immediately that it became known that this measure had passed the House, the charge was broadcast that the medical profession was seeking to provide another way of getting easy money Of course no such thing could possibly be true.

"We asked that the Legislature give us an educational standard for the control of the most serious and dangerous occupation in our modern times, the practice of medicine, and were accused of trying to corner the market We asked that the law be made enforcible, and the charge was renewed and emphasized We even offered to tax ourselves, and were told that our effort was merely to provide a system of harassment for our people, and so forth and so on"

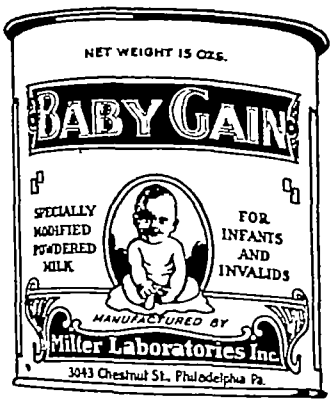
An editorial is quoted, extracts of which read

"Doctors used to be kind and sympathetic with their unfortunate patients in their physical infirmities, but not now with this crowd, who now propose to brand the man whose family is sick as a professional delinquent if he is not able to pay his bill to the trust doctor

"Suppose there is a long spell of sickness in the family—maybe two or three are sick and the last dollar has been spent for medicine and the trust doctor, and the sickness continues The trust doctor calls for more money which the family does not have Then the trust doctor quits and calls the unfortunate family professional delinquents

"For any set of doctors to get together and agree that anybody can't get or have a second doctor until they have paid the first one or because they may have given a mortgage, is an act of barbarism without parallel in history and it ought to bring shame to the faces of those offending

"The resolution which receives the venomous attention of this man, who, incidentally, has no reason in the world for turning the back of his hand to the medical profession, and ample reason for not doing so, was a simple statement from the physicians of Rusk County, addressed to the public, putting the public on notice that the practicing physicians of that county expected to be treated exactly as other people are treated in the matter of payment for services rendered and supplies furnished"



The editor also quotes a legislator whose

(Continued on page 643—adv xxi)

(Continued from page 644—advertising)

editorials, classifying original articles, reviewing other Journals and books, remaining abreast of progress so as to promptly transmit to the members dependable facts and so prepare for you each month a Journal that is of intense value to every member as well as a credit to our Society There is a vast amount of time and labor expended in editorial direction

'In addition to the editorial supervision there is a business side that must be conducted and directed ere each month's issue can be sent to a member In 1928 the total cost of the Journal was $15,103.24 From your annual dues $2 50 per year is credited to the Journal fund A total of $8,458 36 was thus received, leaving a balance of $6,644 88 to be acquired to defray all publication costs This balance is acquired through advertising sales Advertising space is not sold without effort Constant contact with advertisers must be maintained and arguments advanced to secure renewal of expiring contracts Then follows service to the advertiser which consists of securing copy each month, sending it to the printer, obtaining proof, sending the proof to the advertiser and upon its return to cause the printer to make the corrections In addition, inasmuch as the Journal accepts no advertising that is unreliable or not in conformity with the rules of the American Medical Association Council on Pharmacy and Chemistry, all such copy must be carefully read and the Council's published reports examined to ascertain if the drug or preparation has been approved We are not then through with out advertising affairs, monthly 'dummy pages' and copy instructions must be prepared for the printer so that he can make up the advertising forms allocating each ad to its specified place for which the advertiser pays Then, when the month's issue is mailed, entries of sales are made on our ledger, bills made out and remittances credited To cite these details is easy, to execute them consumes much time and labor Our advertising income in 1928 was $8,474 13 Were it not for this income the present Journal could not be sent to our members without an increase in dues of $2 50 per member"

Pure Powdered Milk from Tuberculin - Tested Cows

The Complete Infant Food

When dehydrated (powdered or dried) milk first entered the field, it was looked upon with evident suspicion The reason for this was the thought that the removal of water under heat would change the character of the vital ingredients

But in a modern plant and under the spray process, it takes less than a minute to convert fluid milk into powder under moderate heat Chemically no change takes place, as the milk solids are kept in a cool condition in accordance with a well-known physical law

In BABY GAIN, a milk powdered by the spray process, the casein is broken up and forms light, tender flakes In like manner the butterfat globules are considerably reduced in size, assuring an easy aid to digestion

The experience of hospitals, nurses and physicians has proved that BABY GAIN may be recommended where supplemental or complete bottle feeding is indicated Sample tins and descriptive literature will be sent to physicians on request.

"What is the trouble? Agreeing on the symptomatology, what is the diagnosis, etiology and what the treatment? As far as I can gather, it is the aim of the managing editor to publish in the Journal the papers read at the Annual Meeting and the discussion as far as seems practicable, together with the excellent Clinics, editorials, personal and general news items, and things of interest and for the welfare of the profession. The management is in the hands of our very efficient secretary, George Crownhart, who, not being a medical man, is advised and supervised by an editorial board consisting of three of our ablest physicians of the State

"The Journal bears the earmarks of an excellent publication, as an organization journal From a scientific viewpoint and from the attitude that the Journal should stimulate and inspire its readers to further study of and continued interest in medicine as well as from the elevated forum of medicine as an art, it lacks cohesiveness, sometimes altitude, character, inspiration and humanity

"The etiology of the Journal's ailings in our opinion must be recognized as a deficiency syndrome, a lack of internal secretion and of hormones such as cannot even be furnished by the very excellent brain of our lay secretary but can only be supplied by the inspired and active brain of an enthused medical man, a man similar to Sir Samuel Garth, of whom it has been said, "No physician knew his art more, nor his trade less."

"As for the treatment of the disease afflicting our Journal, I would urge employing, as Scientific Editor-in-Chief, a physician, a paid part time responsible editor who will relieve our Secretary, George Crownhart, of duties and thoughts of necessity foreign to him The exact qualifications and duties of such an editor, as I have in mind, I shall elucidate in a future communication."

The diagnosis of the Editor of the *New York State Journal of Medicine* is that efficient practice follows closely upon ideal theory in the *Wisconsin Medical Journal* His opinion is confirmed by the length of the index of abstracts taken from the *Wisconsin Journal* during the past year

---

MAKING A STATE JOURNAL

The following account of the work required to get out the *Journal of the Michigan State Medical Society* is taken from the April issue

"All too frequently the Journal is received and read with no thought in regard to the details requisite to publish it Our efficient Editor has well enunciated the editorial policy The member is uninformed as to the amount of time given by the Editor in editing the original manuscripts, reading galley proof, then, page proofs, writing

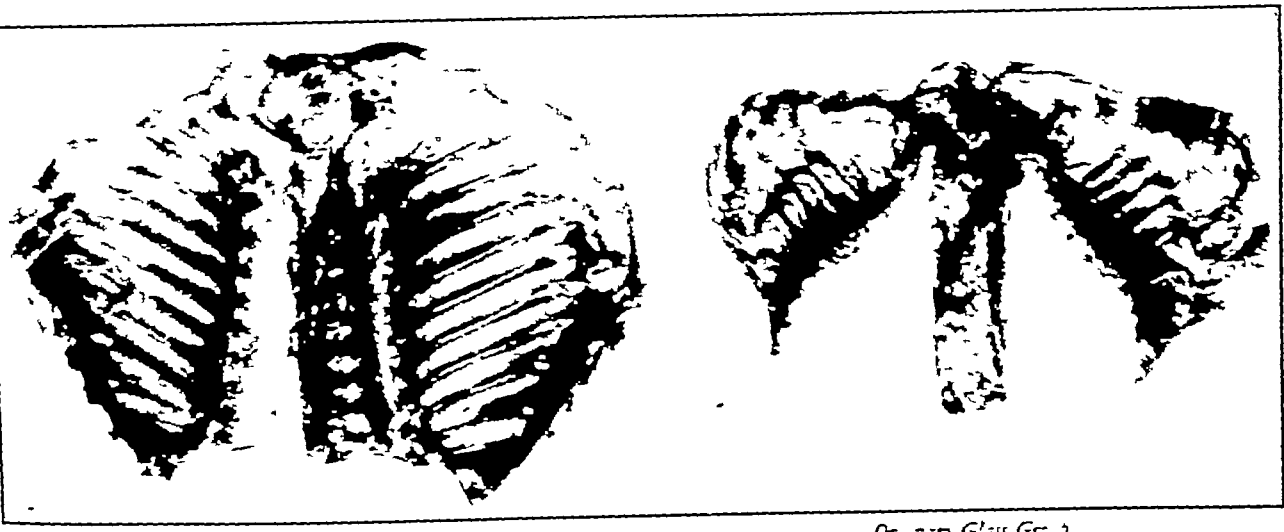
CHRISTMAS SEALS

The success of the sale of Christmas seals for anti-tuberculosis work has led other organizations to consider putting other seals on the market The April 11 issue of the *New England Journal of Medicine* contains the following announcement regarding a sale proposed by the anti cancer society

"The success of the Christmas seal sale in raising money for the prosecution of tuberculosis work led the American Society for the Control of Cancer, Inc , to consider selling seals to help finance the work of the latter organization

"Dr Kendall Emerson and Dr Williams of the National Tuberculosis Association have met the Board of the American Society for the Control of Cancer, and an agreement that the latter named society will not engage in a seal sale this year has been reached

"This is fortunate because the adoption of this method of raising money by other organizations would seriously interfere with the popularity of this appeal Since the present Christmas seal sale has been organized by the Tuberculosis Association, it is fair to leave the field to this body



"The Society for the Control of Cancer has a very definite appeal which can become effective under some other method Although much money has been appropriated for the study of cancer, and able investigators are working on the subject, there is still opportunity for the expenditure of money in attempts to solve the mystery of the disease The money is being supplied to a great extent by foundations and local organizations and progress is being made If more money is needed, it will be forthcoming when sufficient publicity is given to the people"

MEDICAL BENEVOLENCE FUND

The Medical Society of the State of Pennsylvania in making an appeal to its members for contributions to its Benevolent Fund It has a colored insert in the April issue of the *Pennsylvania Medical Journal* quoting the by-laws which permit the officers to put into the fund not more than one dollar annually from the dues of each member It also prints the following description of the fund

"The plan above outlined was inaugurated in 1905 by an allotment of 15 cents from the annual dues of each member of the Society This allotment in the twenty-four years of the fund's history has averaged approximately 26 cents The fund approximates $56,000 In the wisdom of the Board of Trustees, only the earnings from the fund are available for distribution The demand has always absorbed the earnings, therefore the fund has grown and will continue to grow slowly

VITA Glass Group
Here we have normal and regular arrangement of ribs as well as normal and healthy growth.

Ordinary Glass Group
Note lack of growth, distorted contours and crowded placement of ribs.

ANTI-RACHITIC EFFICIENCY OF WINTER SUNLIGHT THROUGH VITA GLASS DEMONSTRATED IN TESTS

Results of Test by Capt. William D. Fleming, U. S. Army Medical Corps, now Available in Pamphlet Form

Right hand photograph shows thoracic development of rat under ordinary glass at the end of Captain Fleming's experiment. The rachitic rosary is evident. Left hand photograph shows normal and regular arrangement of the ribs and normal ossification of rat under Vita glass, as compared to the distorted contours and crowded placement of the ribs, and the abnormalities of ossification in the other animal

A reprint from the *Military Surgeon* is now available, presenting details of this biological test of the action of winter sunlight in preventing rickets and promoting general nutrition.

The test was conducted with white rats by Captain William D Fleming of the Department of Preventive Medicine and Clinical Pathology, Army Medical School, Army Medical Center, Washington, D C.

Nature of the Experiment

Two groups of white rats of the same age were confined in cages under the same daylight for 100 consecutive winter days One group was confined under ordinary window glass, opaque to ultra-violet light The cage of the other group was glazed with Vita glass Both groups were placed on the same diet, which was unbalanced in the calcium-phosphorus ratio, and deficient in Vitamin D

Results of the Experiment

Extreme rickets was produced in the rats under ordinary glass Normal bone calcification characterized the rats under Vita glass. After 100 days the rats under Vita glass averaged 125 grams in weight, as compared to 77 grams for the rats under ordinary glass The average individual weight of the Vita glass group at the beginning of the test was 22 grams; of the group under ordinary glass, 21 grams

Conclusion

"The climate of Washington, D C, during the months of December, 1927, and January, February, and March, 1928," the report states, "afforded sufficient ultra-violet light to promote normal calcification in rats confined under a glass partially permeable to the ultra-violet light and on a diet which produced marked rickets in rats receiving no ultra-violet light under window glass, The gain in weight of the rats receiving this amount of ultra-violet light was also much greater than in those rats not receiving this portion of light The construction of a solarium glazed with a glass permeable to ultra-violet light would therefore appear practical in this locality"

You are invited to mail the accompanying coupon for a detailed report of Captain Fleming's test

Vita glass is being marketed primarily as a health prophylaxis, and not as a therapeutic agent, although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 200 hospitals in England and the United States.

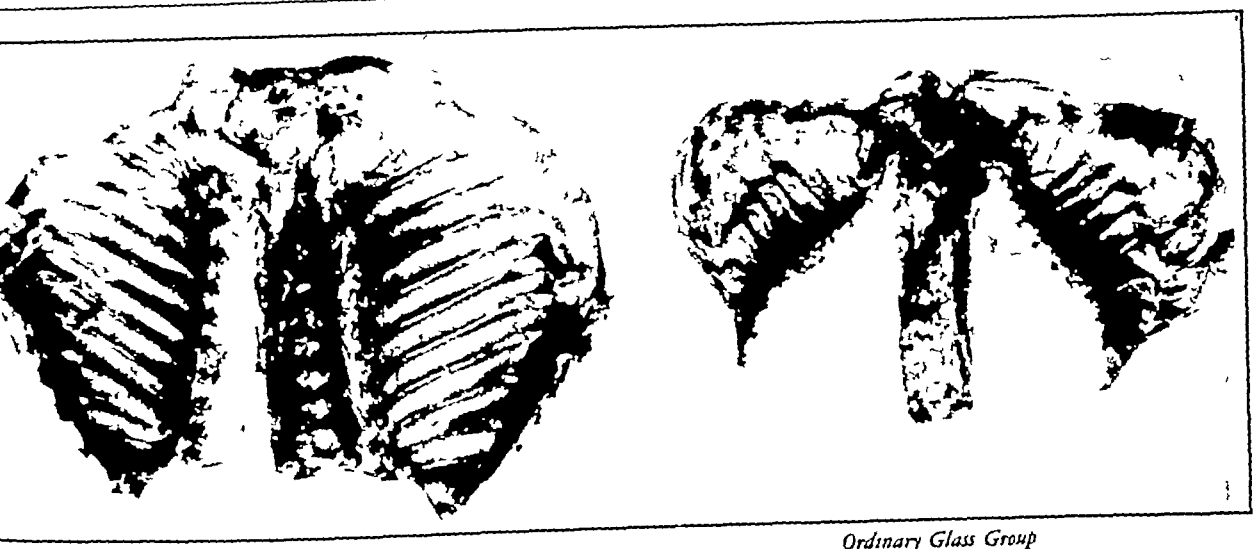
under the allotment system, unless those of our members who are financially able will contribute to the fund While it is not desirable that the benefits from this fund should be at any time looked upon as resembling the benefits operative under health, accident, or old-age insurance, the amount of money available for distribution should be sufficiently large to render real service to applicants whose income is otherwise inadequate to provide the ordinary necessities of life In the twenty-four years of its existence the fund has received contributions of but $4,440, and the Committee on Benevolence, realizing the fund's inadequacy, herewith solicits subscriptions and legacies to be added to the principal of the Fund For your convenience blanks are attached Subscriptions will be acknowledged through the columns of the *Pennsylvania Medical Journal*"



PAYMENT FOR MEDICAL SERVICES TO COUNTY EMPLOYEES

The physicians of Los Angeles, who treat County employees will receive pay for their services according to the following news item in the April issue of *California and Western Medicine*

"The county Board of Supervisors recently issued a general order that county employees should no longer be sent to the county hospital, but should be cared for by physicians in private practice, the professional services to be paid for as provided in the fee tables of the State Compensation Fund This action also establishes a precedent

"It is hoped that other counties of California which have called on non-salaried attending staff members of county hospitals, who give gratuitous service to the indigent sick and injured, to also give professional services to county employees and other non-indigent county hospital patients, will modify such rules of procedure, and observe the statutes ond ordinances having to do with county hospitals and industrial practice work

"Component county societies of the California Medical Association located in counties where the above and similar evils exist should take steps to bring such improper procedures on the part of county officials to the attention of the proper authorities so that this deplorable practice of misusing the altruistic services of medical men will come to an end in California The medical profession cannot expect others to appreciate gratuitous professional services unless the members of the profession themselves respect such services"

VITA Glass Group

Right hand photograph shows thoracic development of rat under ordinary glass at the end of Captain Fleming's experiment. The rachitic rosary is evident Left hand photograph shows normal and regular arrangement of the ribs and normal ossification of rat under Vita glass, as compared to the distorted contours and crowded placement of the ribs, and the abnormalities of ossification in the other animal

A reprint from the *Military Surgeon* is now available, presenting details of this biological test of the action of winter sunlight in preventing rickets and promoting general nutrition.

The test was conducted with white rats by Captain William D Fleming of the Department of Preventive Medicine and Clinical Pathology, Army Medical School, Army Medical Center, Washington, D C

Nature of the Experiment

Two groups of white rats of the same age were confined in cages under the same daylight for 100 consecutive winter days One group was confined under ordinary window glass, opaque to ultra-violet light. The cage of the other group was glazed with Vita glass Both groups were placed on the same diet, which was unbalanced in the calcium - phosphorus ratio, and deficient in Vitamin D

Results of the Experiment

Extreme rickets was produced in the rats under ordinary glass Normal bone calcification characterized the rats under Vita glass After 100 days the rats under Vita glass averaged 125 grams in weight, as compared to 77 grams for the rats under ordinary glass The average individual weight of the Vita glass group at the beginning of the test was 22 grams, of the group under ordinary glass, 21 grams

Conclusion

"The climate of Washington, D C, during the months of December, 1927, and January, February, and March, 1928,' the report states, "afforded sufficient ultra-violet light to promote normal calcification in rats confined under a glass partially permeable to the ultra-violet light and on a diet which produced marked rickets in rats receiving no ultra-violet light under window glass, The gain in weight of the rats receiving this amount of ultra-violet light was also much greater than in those rats not receiving this portion of light The construction of a solarium glazed with a glass permeable to ultra-violet light would therefore appear practical in this locality"

You are invited to mail the accompanying coupon for a detailed report of Captain Fleming's test

Vita glass is being marketed primarily as a health prophylaxis, and not as a therapeutic agent, although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 200 hospitals in England and the United States.

VITA GLASS

Brings the sun indoors

Vita is the trade-mark (Reg U S. Pat Office) of and indicates glass and glassware manufactured for and sold by Vitaglass Corporation, New York City

Eight "Hindle" Electrocardiographs Serve the Bellevue and Allied Hospitals

The Great Importance of the electrocardiograph in Research, Teaching and Clinical work is indicated by the **Eight "Hindle" Electrocardiographs** required by the Bellevue and Allied Hospitals of New York and Cornell University Medical Colleges

The No. 2 Model illustrated has recorded over 8,000 cases in the past two years

A No 3 Mobile Unit, which is wheeled to the patient's bedside, has averaged 1,000 tracings monthly in a special Pneumonia Research by Cornell, New York and Columbia Universities

Six other Instruments—Models No 1, No 2 and No 3 are in constant use by the Pharmacology, Physiology and Clinical Depts

FIFTEEN YEARS EXPERIENCE is embodied in the four available "Hindle" models **All Hindle records produced are of unquestioned integrity**

Send for literature

under the allotment system, unless those of our members who are financially able will contribute to the fund While it is not desirable that the benefits from this fund should be at any time looked upon as resembling the benefits operative under health, accident, or old-age insurance, the amount of money available for distribution should be sufficiently large to render real service to applicants whose income is otherwise inadequate to provide the ordinary necessities of life In the twenty-four years of its existence the fund has received contributions of but $4,440, and the Committee on Benevolence, realizing the fund's inadequacy, herewith solicits subscriptions and legacies to be added to the principal of the Fund For your convenience blanks are attached Subscriptions will be acknowledged through the columns of the *Pennsylvania Medical Journal*"

PAYMENT FOR MEDICAL SERVICES TO COUNTY EMPLOYEES

The physicians of Los Angeles, who treat County employees will receive pay for their services according to the following news item in the April issue of *California and Western Medicine*

"The county Board of Supervisors recently issued a general order that county employees should no longer be sent to the county hospital, but should be cared for by physicians in private practice, the professional services to be paid for as provided in the fee tables of the State Compensation Fund This action also establishes a precedent

"It is hoped that other counties of California which have called on non-salaried attending staff members of county hospitals, who give gratuitous service to the indigent sick and injured, to also give professional services to county employees and other non-indigent county hospital patients, will modify such rules of procedure, and observe the statutes ond ordinances having to do with county hospitals and industrial practice work

"Component county societies of the California Medical Association located in counties where the above and similar evils exist should take steps to bring such improper procedures on the part of county officials to the attention of the proper authorities so that this deplorable practice of misusing the altruistic services of medical men will come to an end in California The medical profession cannot expect others to appreciate gratuitous professional services unless the members of the profession themselves respect such services"

SMALL BENIGN TUMORS OF THE FACE*

By LAWRENCE K McCAFFERTY, M.D, and VICTOR A. LOPEZ, M.D, NEW YORK, N Y

From the Department of Dermatology, Vanderbilt Clinic, Physicians and Surgeons, Columbia University
From the Department of Pathology, Virchow Krankenhaus, Berlin, service of Professor Erwin Cristeller

THE tumors which are grouped under this classification are adenoma sebaceum multiple benign cystic epithelioma, tricho-epithelioma, syringo-cyst-adenoma and hidrocystoma

A clinical and differential description of these tumors will be dispensed with, inasmuch as this subject would comprise an article in itself It might be stated, however, that with the exception of adenoma sebaceum, the rest of these tumors are clinically almost impossible to differentiate

There is probably no single group in medicine which has received so many different names Each author in describing one of these tumors histologically, has seen fit to confer upon it a name In most cases the name fits the histologic picture But in general, we will see, that while the histologic picture differs to some extent in each one of the above tumors, the embryonic origin is singular

From an embryonic point of view, all of the above tumors are related They are all derived primarily from the ectoderm If we may diverge for just a moment in order to briefly review our embryology (1), it may help us to understand the possible origin of these tumors

"The hairs are derivatives of the epidermal layer of the ectoderm In embryos of three months, local thickenings of the epidermis appear (beginning in the region of the forehead and eyebrows) and grow obliquely into the underlying dermis in the form of solid buds—the hair germs As the epidermal bud grows deeper, its central cells become spindle-shaped and undergo keratinization to form the beginning of the hair shaft, the peripheral layers constitute the anlage of the root sheath"

"The sebaceous glands usually develop in connection with the hairs From the root sheath a solid bud of cells grows out into the dermis and becomes lobed The central cells of the mass undergo fatty degeneration and the products of degeneration pass to the surface of the skin through the space between the hair and its root sheath The more peripheral cells proliferate and give rise to new central cells which in turn are transformed into the specific secretion of the gland, the whole process being continuous"

"The sweat glands begin to develop during the fifth month as solid cylindrical growths from the deeper layers of the epidermis into the dermis Later the deeper ends of the cylinders become coiled and lumina appear The lumina do not at first open upon the surface but gradually approach it as the deeper epidermal layers replace the more superficial"

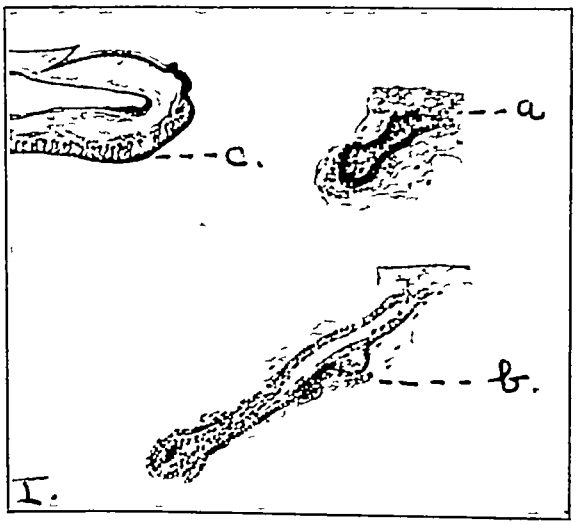

FIG 1

(a) Development of a hair from the epidermal layer of the ectoderm (b) Development of a sebaceous gland from the root sheath (c) Showing the development of the sweat glands (Cross section of terminal phalanx of finger of embryo After Bailey and Miller)

The adenomas to which we are about to refer, are, we believe, derived from the sebaceous glands Clinically and histologically, they present a distinct type. Balzer and Menetrier (2) (1885)

WANTED SALARIED APPOINTMENTS EVERYWHERE for Class A Physicians. Let us put you in touch with investigated candidates for your opening No charge to employers. Established 1896 ANZOE SERVICE is National, Superior AZNOE'S NATIONAL PHYSICIANS' EXCHANGE, 30 North Michigan, Chicago

FOR SALE—The Spa Sanatorium for general cases Founded and operated since 1902 by Dr A. I. Thayer Now for sale to close the estate. Situated in the mineral belt of the lower Adirondacks six miles from Saratoga Springs Reservation. Write for particulars to Mrs A I. Thayer, Ballston Spa, N Y

PHYSIOTHERAPIST

POSITION WANTED—Registered, 34 years experience, Skilled all modalities. Part time work physician's office Lindgren. Tel, Flushing 1556

IDEAL LOCATION FOR SALE for building Sanatarium or hospital Will sell any number of acres up to 100 On State Road, altitude 2 140 feet, electricity, pure water, coal mines nearby Highest point on Susquehanna Trail For particulars, write Mrs R. P Douglass Mountain View Inn, Blossburg, Pa.

OFFICE to sublet, newly renovated, fully equipped including fluoroscope and physiotherapy apparatus Central location, ideal for specialist or suburban doctor desiring city location. Full time to few hours use may be arranged Moderate rental Call Decatur 2824 or write Doctor, 1171 Sterling Place, Brooklyn

FOR SALE—Office equipment of Dr A B Foster deceased Leather operating chair, Jones scales portable violet ray equipment, battery, blood pressure equipment, electric sterilizer, instruments of all kinds. Inquire of Mrs A. B Foster Fonda, Montgomery Co, New York

4 OR 8 ROOMS, corner apartment first floor, for Doctor or Dentist. Best location in Jackson Heights. Inquire Winton, 9 to 5, Killanna Arms, corner 83rd St. and Hayes Ave. After 7 P M, phone Astoria 10148

NELSON LOOSE-LEAF MEDICINE OFFERS

A Practical System of Treatment for both General Practitioner and Specialist, by the Medical Authorities of the world, kept continually up-to-date with the Nelson Loose-Leaf Binding Device

Free membership in the Nelson Research Service Bureau for Scientific and Medical information, which furnishes you with all the information obtainable upon any subject in medicine.

Annual Surveys and the Literature edited by the leading physicians of America Six thousand (6,000) articles are abstracted yearly from all the important medical journals of the world by our special staff of reviewers An Editorial Board of 67 of the foremost physicians in America then critically select from these and edit with comment all that is of value and that signifies an advance This great service keeps every subscriber fully informed of the world's medical progress This is the only service of its kind Please sign coupon on page iii—*Adv*

SEDOBROL

Bromide in a delicious hot broth

Two cubes to a cupful of piping hot water make this palatable bromide broth physicians and patients alike agree is so effective From the patient's point of view Sedobrol is simply a savory, nutritious bouillon but hidden within is that very valuable therapeutic agent sodium bromide, in a highly refined form—a harmless and soothing sedative for nervous agitation of all types Sedobrol cubes are used to marked advantage wherever bromides are indicated—See page v—*Adv*

KALAK WATER

Many diseases are complicated by an "acidosis" An important part in their treatment consists in replacing those elements needed to maintain the alkali reserve

In clinical practice a rational and agreeable method of alkalinization is afforded in Kalak Water—See page iv—*Adv*

ELI LILLY & COMPANY

The decades spanned by the career of Eli Lilly and Company have witnessed more progress in the refinement and development of medical products than all the centuries preceding

In the late fifties, his preceptor read in a French journal of a method of coating pills by impaling the pill on a needle set in a cork and immersing the pills in melted gelatin He translated the article to Eli Lilly and suggested that he try the experiment

Eli Lilly was probably the first in America to gelatin-coat pills Later he increased the speed of the process by setting a row of needles in a wooden bar and dipping a number of pills at a time In 1879 he devised the first method by which pills could be given an imperforate gelatin coating For many years Lilly pills were unique in this respect—See page x—*Adv*

WELL KNOWN EMPLASTRUM ADOPTS NEW NAME

The manufacturers of Pneumo-Phthysine, the well-known emplastrum, which is widely prescribed by the medical profession, have announced that from now on their product will be known as Numotizine

This change has been made in order to bring the name of the product in line with the modern ideas regarding nomenclature of pharmaceutical preparations

It will be seen that the new name is practically a simplified spelling of the old name of the preparation. There is no change whatever in the product, the formula or the packings

The manufacturers announce that they will be glad to send specimen containers bearing the new label to any physician wishing them

The address of the company is Numotizine, Inc, 220 W Ontario Street, Chicago, Illinois—See page xxv—*Adv*

LACTO-DEXTRIN

Lacto Dextrin is a carefully prepared combination of the two well known carbohydrates, lactos and dextrin. It is, therefore, not a medicine but a concentrated food.

It is ideal for use in cases of intestinal putrefaction and toxemia, because it affords a rational and effective method of restoring the normal intestinal flora

The story of how to use Lacto Dextrin and Psylla is contained in the interesting presentation "A Practical Method of Changing the Intestinal Flora" Send for copy together with clinical trial packages on request.—See page ix—*Adv*

FORMALDEHYDE

A powerful, non-corrosive sterilizing medium of high germicidal efficiency prepared especially for sterilizing Bard Parker Knives and other fine surgical instruments

Destroys the most resisting spore-bearing bacteria in one and a half hours Does not injure the keen edge of Bard-Parker Blades or other fine steel instruments after two weeks' immersion

The Bard-Parker Sterilizing Container for hospital and office use is especially designed for the sterilization of Bard-Parker Knives Write for circular giving complete description of Bard-Parker Sterilizing Container and formaldehyde Germicide.—See page xi. —*Adv*

FOXGLOVE FARM

The Upsher Smith Company is telling the story of its Foxglove Farm through full page ads each month in this publication during 1929

Foxglove Farm, located on Lake Minnetonka, Minnesota, near the city of Minneapolis, is the only farm of its kind in the world. Here Upsher Smith and his sons personally supervise the seed planting, cultivation, cutting and drying of the famous Minnesota grown Digitalis Leaves are cut at time of maximum potency and dried rapidly to avoid decomposition. Then expert pharmacologists standardize the products according to the Hatcher Cat Unit Method, in this way insuring uniformity of strength from year to year

If unacquainted with the fine Digitalis products of Upsher Smith, drop a line to the Upsher Smith Company, *Suite 554, Sexton Bldg*, Minneapolis, Minnesota, and request a trial package—See page xiii—*Adv*

VITA GLASS BRINGS THE SUN INDOORS

Vita glass has been subjected to accelerated weathering tests many times by the Bureau of Standards, Professor Stockbarger of Massachusetts Institute

number of lobules The single cells are broad, large and foamy There are several dilated blood vessels in the papillary region In the stroma of the tumor—especially in the upper papillary layer

FIG 2

Balzer type of Adenoma sebaceum which may be spoken of principally as a hyperplasia of sebaceous glands

—there is a marked round-cell infiltration There is a slight increase of fibrous tissue. Therefore, we have here both hypertrophy and hyperplasia of the sebaceous glands with enlargement of the sebaceous gland cells, dilated blood vessels in the papillary zone and a slight increase of fibrous tissue.

A histological discussion of multiple benign cystic epithelioma, tricho-epithelioma, syringo-cyst-adenoma and hidrocystoma will now be taken up The above names have been decided upon as best characterizing the histology of this group Numerous names have been suggested by many authors who have described one or the other of these conditions and it might be said here that most of the authors have presented convincing arguments for their viewpoints The names which have been suggested will be here set forth

Epithelioma Adenoides Cysticum (Brooke)
Multiple Benign Cystic Epithelioma (Fordyce)
Adenoma Sebaceum (Balzer and Menetrier)
Tricho-Epithelioma Papulosum (Jarisch)
Colloid Milium (Philippson)
Lymphangioma Tuberosum Multiplex (Kaposi)
Syringo-cystoma (Neumann)
Adenoma of the Sweat Glands (Perry)
Celluloma Epitheliale Eruptif Kystique (Quinquaud)
Hemangio—Endothelioma—Tuberosum Multiplex (Jarisch)
Endothelioma Tuberosum Multiplex Colloides (Kromayer)
Cystadenomes Epitheliaux Benins (Besnier)
Naevi Epitheliaux kystiques (Besnier)
Naevi Cystepithelomatosi Disseminati (Gassmann)
Hidra-denomes Eruptifs (Jacquet-Darier)
Epitheliomes Adenoides des Glandes Sudoripares (Jacquet-Darier)
Adenomes Sudoripares (Jacquet-Darier)
Gutartiges Epitheliom Verbunden mit Kalloider Degeneration (Philippson)

One will readily understand after reading such an imposing list of names, just how confusing this whole subject has been and still is

Jacquet[8] at the International Dermatological Congress held in Paris in 1889 proposed the name benign cystic epithlioma of the skin In 1892 Fordyce[9] described a similar case under the title of multiple benign cystic epithelioma of the skin His histologic description is so clear that it will here be quoted

"Under low magnification or with the naked eye, the derma contained a number of irregularly rounded, oval and elongated masses which

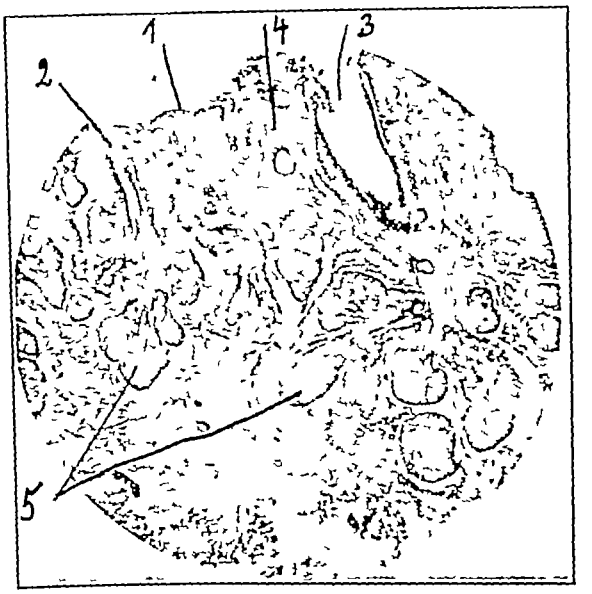

FIG 3

Pringle type of Adenoma sebaceum which may be classified as simple hypertrophy of the sebaceous gland lobules (5) and dilatation of the blood vessels (4) There is some hyperplasia also with slight increase of fibrous tissue This may be considered a mixed type (Pringle and Balzer) 1 Epidermis 2. Dilated follicular orifice 3 Gaping follicular orifice

take a deeper stain than the surrounding tissue In some sections these cell masses are quite distinct while in others they intercommunicate in the most remarkable manner The cell masses extend from beneath the epidermis to the coil

and Balzer and Grandhomme (3) (1886) were the first to describe this condition and called it adenoma sebaceum Following their descriptions there were three more cases added (1886-1887), these appeared in the form of moulages at Saint Louis Hospital Then came Pringle's (4) case which he described in 1890, which differed clinically and histologically from Balzer's But, nevertheless, it was a sebaceous gland tumor

Therefore, we have two groups (1) the Balzer type and (2) the Pringle type The Balzer type is rare, whereas the Pringle is not uncommon Balzer and Grandhomme in describing their second case, which was similar to the first, stated that the tumor was formed of epithelial lobules, which developed from the hair follicles, the cul-de-sac of the sebaceous glands or from the walls of the excretory ducts These epithelial lobules were formed of bundles of small cells with large nucelli, which were drawn and polyhedric from pressure These many cells which made up the mass of the lobule, were separated by a recticulum, in this recticular net work they saw occasionally connective tissue fibers In the anterior of the lobes were some small cysts, there were also larger cysts resulting from the dilatation of the cul-de-sac or exist of the sebaceous glands in which there were accumulated keratinized or desquamated cells All the pilosebaceous appendages were not involved in the neoplasm, some follicles were completely healthy, others contained large epithelial buds Finally they saw some cul-de-sacs of sebaceous glands in the stage of proliferation The lobules were circumscribed by connective tissue which seemed to form a capsule The sweat glands and ducts were normal

Pringle's case differed from the above description in the following manner The upper part of the papillary layer had much hypertrophic connective tissue, but was without infiltration There were many dilated vessels which gave the tumors their clinical appearance of telangiectasiae The sebaceous glands were markedly hypertrophic rather than increased in number and suggested to Pringle the appearance of rhinophyma Most of the sebaceous glands were connected with the hair follicles, aside from the glands being hypertrophic, they were otherwise normal

Pezzoli (5) in a very interesting review of this subject, cites Barlow's viewpoint, who differentiates between a simple glandular hypertrophy and a hyperplasia He believes that an increased number of sebaceous glands or a hyperplasia of the sebaceous glands which more or less simullates the construction of a gland but is somewhat different from the original tissue and which is unable to accomplish its function, should be spoken of as a real adenoma or neoplasm, whereas a hypertrophy is not a true adenoma Balzer's cases, he believes were hyperplasias of the sebaceous glands and were, therefore, real adenomas, whereas Pringle's cases were simply hypertrophic sebaceous glands with dilated vessels and not truly adenomas However, in view of the fact that most of the cases are the Pringle type and have been called adenoma sebaceum, we must adhere to this name Personally, we see no objection to this name whether the histology shows a glandular hyperplasia or a hypertrophy of the acini, as long as the principal change concerns the sebaceous glands

Hallopeau (6) gives a rather interesting classification Where the sebaceous glands are the predominating feature, he speaks of it as Balzer's adenoma sebaceum Where the blood vessels are prominent, he refers to it as the Darier-Pringle nevi telangiectasiques Where the connective tissue element is the most striking, he refers to this as Hallopeau-Leredde (7) nevi fibreux

Darier has the opinion that some of these adenomata may have a congenital origin and take their departure from a malformation of epithelial or glandular tissue with or without hypertrophy of the cells

Time and space will not permit us to review most of the reported cases of this condition. There are many excellent articles which we have had to omit but which will appear among the references We have tried to give you the two principal types of adenoma sebaceum and the most logical conclusions which have been derived from the earlier writers The authors who have followed have concurred in most instances with those of the pioneers in this subject However, there are many cases which unquestionably represent features of both the true Balzer and the true Pringle types It has occurred to us that this differentiation between the two types is not nearly so pronounced as it may seem from reading the literature

Balzer type of Adenoma sebaceum (Fig 2)

Low power The section is studded with sebaceous gland lobules which extend from just beneath the epidermis to the fat Surrounding the hair follicle which is shown in the microphotograph, are numerous lobules The cells of the lobules as well as the lobules themselves, are normal in size There is a fibrous capsule surrounding these lobules The lobules themselves are separated by thin strands of fibrous tissue. No evidence of dilated blood vessels nor infiltration was made out Therefore, the section shows a hyperplasia of the gland substance rather than hypertrophy, in addition to this, there is a fibrous tissue capsule

Mixed type of Adenoma sebaceum (Fig 3)

Low power The tumor is covered by normal, intact epidermis which is perforated by the dilated orifices of the ducts of the sebaceous glands, some of which are quite dilated and filled with horny plugs The adenoma itself consists of hypertrophic lobules as well as an increased

follicle, there was a definite proliferation of cells which suggested very strongly the possibility that these cell nests were developed from the hair appendages The round-celled infiltration was deep in the section and was localized in one area It appeared to bear no relationship to the cell nests There was a marked increase of fibroblastic tissue The coil glands were normal Sebaceous glands were conspicuously absent The blood vessels were normal The epidermis was atrophic.

The last two tumors syringo-cyst-adenoma and hidrocystoma may be considered together, in as much as both are tumors of the sweat ducts While these tumors come from the ectoderm, they are histologically distinct from adenoma sebaceum, multiple benign cystic epithelioma and tricho-epithelioma with which they have been confused at times

This condition was first examined microscopically by Darier[14] who gave it the name hidradenoma with colloid cysts Torok in 1889 called it syringo-cyst-adenoma It perhaps is the best name because it implies an adenomatous tumor of the sweat duct

Torok[15] stated that the tumor consisted of small cavities which were round or pear-shaped, having the width of a sweat gland duct. The walls of the ducts are formed of two or three rows of epithelial cells of which the outer layers consist of more or less flattened cells with well stained nuclei There was no limiting membrane seen The cells which form the wall next to the cavity are swollen and stain poorly The wall cells gradually desquamate into the lumen and cause it to become more dilated and consequently the cell wall more flattened The cavity may be entirely empty or contain a homogeneous substance In addition to the cysts there are cell strands and tail-like projections It is supposed that the cysts develop from the cell strands which is brought about by central degeneration of the cells The somewhat wider cell strands in which no lumen could be discovered have a double cell row and are occasionally so similar to the excretory ducts that one may mistake them There is also an increase in the connective tissue, especially around these small cysts.

Are these cysts developed from the normal sweat ducts or are they embryonal in origin? Torok and Unna are of the latter opinion. The coil glands are normal in appearance, situated below the tumor proper and, furthermore, they have never been shown to be connected with these cysts Therefore, we must exclude them from this picture Perhaps the most plausible theory is, that, as the sweat ducts develop for some unknown reason they never reach the lower part to form a coil gland but are abruptly stopped in their development and later produce cystic changes which in turn constitutes the tumor

Other writers have suggested a hyperplasia of the cells of the normal sweat ducts We are inclined to agree with Torok's views pertaining to the embryonic origin of the tumors We believe that there would be a definite change in the coil glands if these cysts developed in normal sweat ducts In no case was any writer able to connect these cysts with the coil glands Therefore, it is assumed that they are embryonic 'rests"

SYRINGO-CYST-ADENOMA (Figs 5 and 9)

Low power This section showed the three layers of the skin, namely the epidermis, cutis, and subcutaneous tissue The tumor proper occupies the middle of it, nearer the surface, while the deeper parts show the normal distribution of sebaceous and sweat glands One sees two different formations of adenomatous change in the tumor, narrow tubes of about the size of sweat glands and cystic dilated tubes of a syringoma character

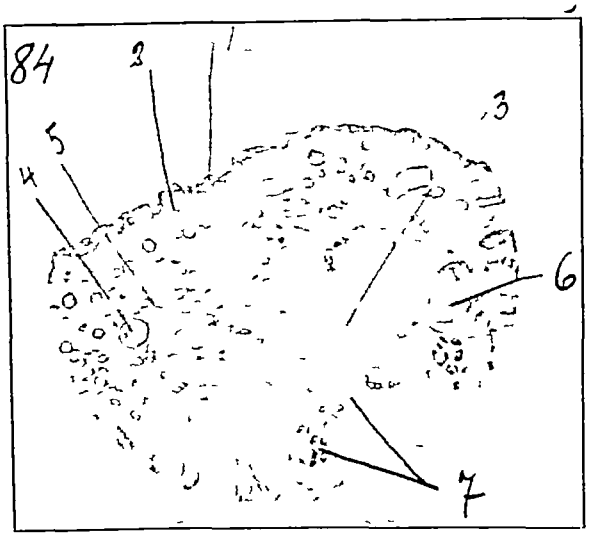

FIG. 5

Syringo-cyst-adenoma This shows the tumor in the middle of the section characterized by numerous sweat ducts and dilated sweat ducts of syringomatous character The sweat glands may be seen in the lower part of the section, there being apparently no connection regarding the origin of the sweat ducts above 1 Epidermis 2 Corium 3 Mid-cutis 4 Dilated sweat duct with debris 5 Numerous small sweat ducts which are larger than normal 6 Sebaceous gland 7 Sweat gland

High power One sees small groups of cells and strands of cells There is seen small cystic developments with a wall consisting of one or two rows of cells and sometimes more There are still larger cystic developments containing either a perfectly clear lumen or else a lumen consisting of homogeneous, granulated substance The wall is composed of a row of large, globu-

glands They consist of epithelial cells having the same appearance as the cells in the lower layers of the epidermis They are enclosed in connective tissue which has undergone thickening In some places instead of cells nests, they are made up of narrow tracts two or more cells wide, the narrower tracts resemble coil gland ducts although no distinct lumen could be seen Occasionally the cell nests show pearls, then again they are cystic containing degenerated cell detritus or else are empty Some of these cell masses resembled alveolar or gland tissue but high magnification showed them of epithelial origin In one section there was an attempt made by cell strands to form a sweat gland with a distinct lumen but it lacked an external limiting membrane"

He found a direct downgrowth and proliferation in one section from the epidermis and also from the external root sheath of the hair follicle

Just after Fordyce had written his excellent article, Brooke published a very similar case in England Brooke called his case epithelioma adenoides cysticum He traced the tumor elements to the epidermis

Jarisch described a similar case and gave it the name of tricho-epithelioma He found strands of cells coming from the hair papillae but could find no connection with the epidermis There were cell nests, strands and cysts as in Fordyce's and Brooke's[10] cases Wolters could not agree to the name Jarisch[11] gave because he felt that the cell nests were so numerous and the hair papillae so few that such an interpretation was entirely too narrow Wolters[12] is of the opinion after reviewing all of the reported cases up to that time—including White's[13] unusual case—that these tumors may develop not only from the hair papillae and neck parts of the sebaceous glands, but also from the epidermis

It is furthermore quite probable that some of these tumors develop from embryonal "cell rests" which remain inactive until puberty and then develop into the numerous cell strands and nests

After carefully reviewing the literature, there is much evidence in favor of these tumors having a manifold origin—some coming from the epidermis, others from the hair papillae and root sheath and still others possibly from embryonic "cell rests"

TRICHO-EPITHELIOMA (Fig 4)

Low power Throughout the section, extending from just beneath the epidermis almost to the fat, are numerous cell nests, strands and cystic bodies with small tail-like projections In one part of the section, in the deeper part of the dermis, is a moderate round-celled infiltration There is also an increased number of fibroblasts with an associated increase of the fibrous tissue In no place throughout the section, was there any evidence of these cell nests or strands coming from the epidermis However, in one part of the section, there was a strong suggestion that these strands were off-shoots from the hair papilla and root sheath

High power The cell nests and strands were made up of deeply stained cells which resembled the cells in the basal layer of the epidermis or

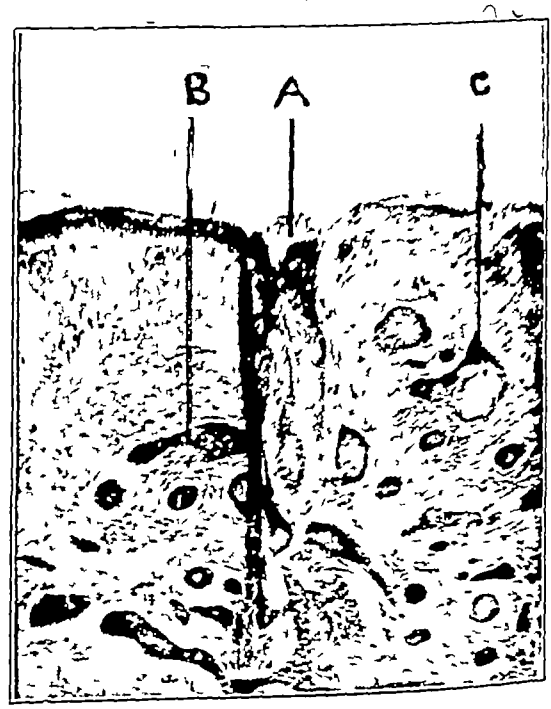

FIG 4

Tricho-epithelioma Showing cell nests coming off of the hair follicle Also shows the cystic degeneration in the centers of some of the nests Some of these nests suggest dilated sweat ducts hence the confusion with syringo-cyst-adenoma A—Hair follicle B—Cell nest coming off of the hair follicle C—Cystic degeneration in the center of the cell nest

the hair sheath Some of the strands gave the suggestion of ducts However, no lumen in these strands could be made out The cell nests which showed a cystic development, contained deeply stained cells at the periphery, but towards the center or cystic part, the cells lost their staining power—the central portion of the cyst contained fragmented, non-stainable, granulated, homogeneous masses Several of the cell nests with cystic development resembled very markedly dilated sweat gland ducts In one or two places, where the strands consisted of two or three rows of cells, there was a very suggestive lumen which would lead one to believe that these might be sweat gland ducts Occasionally, from the walls of these strands, there was a slight proliferation which suggested the possibility of the development of these nests from sweat ducts Coming out from the root sheath and papilla of the hair

FIG 7

Milium (A) This shows a milium probably formed from embryonal sebaceous cells (B) which later take on secretory activity followed by cystic development

microphotograph of Fig 7 and the clinical picture of Fig 8, it is not necessary to explain further

FIG 8

Milia—as seen around the inner aspects of both eyelids

(Figure 9)

In the foregoing, we have taken up the histologic picture of the above mentioned tumors After a careful review of the literature and a study of the various sections representing these tumors, we have arrived at the following conclusions

(1) There are two types of adenoma sebaceum—one being the Balzer type which consists of an increased number of sebaceous glands enclosed in a fibrous tissue capsule The second type is the Pringle type which is made up principally of hypertrophic sebaceous glands with an increased fibrous tissue element and dilated blood vessels

(2) Multiple benign cystic epithelioma and tricho-epithelioma resemble each other so closely histologically, that it is impossible to differentiate them Their origin may be from the epidermis or the hair papillae, or both Furthermore, a second hypothesis must be mentioned, and this is that they may be derived from embryonic "rests" or "germ buds"

(3) Syringo-cyst-adenoma is a tumor consisting of dilated sweat ducts with an associated increased fibrous tissue element They may be derived from embryonic "rests" or from a proliferation of the normal ducts It is impossible to state with any degree of accuracy which one of these two hypotheses is correct, but we favor the former view

(4) Hidrocystoma, one of the rarest of this group consists of an extreme dilatation of the sweat ducts near the coil glands and directly connected with the coil gland below and the continuation of the excretory duct above Its etiology is obscure It is possible that it may be the result of mechanical obstruction brought about by excessive hyperidrosis, as most of the reported cases occurred in persons exposed to extreme degrees of heat

FIG 9

Syringo-cyst-adenoma beneath the eyes, cannot be differentiated from multiple benign cystic epithelioma except microscopically

So many names have been suggested, and, consequently, much confusion has arisen regarding these benign tumors It is suggested that they be all placed under one classification or name such as Multiple Benign Tumors of Ectodermal Origin with a suffix indicating their special derivation

TREATMENT

While a histological study of these benign tumors is interesting and important for classification we feel that the article would be incomplete without a few words regarding their treatment

In view of the fact that these tumors are all quite superficially situated in the skin, the best and quickest method is superficial desiccation We have treated some of the above conditions by this method and the results have been excellent

A few weeks after treatment in cases which

lar cells with a granular protoplasm A limiting membrane in places bulges into the cystic cavity The outer wall consists of one or two rows of flattened cells There is a proliferation of

FIG 5 (a)

Still higher power showing cells lining the sweat ducts, detritus and proliferation from the periphery The high power here could not be confused with the high power of multiple benign cystic epithelioma There is an increased connective tissue stroma throughout

cells coming off from some of these thin strands of cells and also from the outer walls of these cystic developments, giving the impression that there was a hyperplasia existing There was no direct connection between any of these strands or cystic developments with the coil glands There was an increase of the fibroblastic elements—especially around some of the cystic developments There was a moderate inflammatory reaction The coil and sebaceous glands were normal

Hidrocystoma is a term used by Robinson[16] in describing a cystic development of the sweat duct He found the secretory portion of some of the coil glands had an enlarged lumen from dilatation of the tube and a compression of the epithelial cells against the basement membrane, the lumen was filled with liquid and a granular material Other glands showed granular contents without any enlargement of the tubes With the exception of these few with enlarged coil tubes and those ducts connected with cystic formation of the sweat glands, both the secretory and excretory portions appeared normal The larger cyst of the sweat duct showed a disappearance of its contents and the presence of several rows of epithelial cells lining the cyst wall The larger sweat duct cyst showed the excretory duct continuing its course toward the epidermis, whereas the smaller sweat duct cyst directly connected with its coil gland

The sections show that the vesicles arise from dilatations of the excretory duct of the sweat glands in the lower part of the corium

Robinson was unable to state definitely the cause of this cystic development He did not believe it due to obstruction from detached epithelium, the result of excessive hyperidrosis If so, it would occur at the narrowest portion, the epidermis, but this was not true Furthermore, hyperidrosis is common while the condition is rare

HIDROCYSTOMA (Fig 6)

Low power The section shows two extremely large cysts which occupy almost the entire section extending from just beneath the epidermis. The sweat glands are just beneath these cysts and appear normal with the exception of one or two parts of the glands being slightly dilated. There is no evidence of the sweat ducts leading from the cyst to the epidermis nor is there any direct connection seen between the coil glands and the cysts The stroma between the epidermis and the cysts is somewhat compressed There is a slight round-celled infiltration around these cystic developments Some small sebaceous glands are seen slightly compressed near the

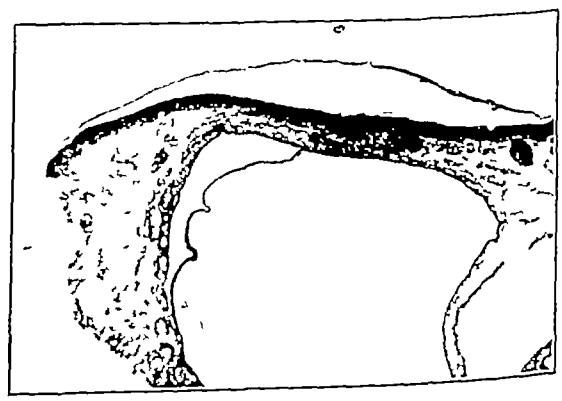

FIG 6

Hidrocystoma (A) showing the cystic dilatation of the sweat ducts, (B) the sweat gland may be seen at the lowest part of section (C) Some of these coils are dilated due to cystic dilatation of the ducts

cysts There is a slight dilation of the blood vessels at the sides of these cysts A few hair follicles are seen The epidermis is normal

High power The larger cyst has a definite wall which consists of two rows of cells which are quite compressed The smaller cyst has a wall in which the two rows of cells are easily seen These cells are normal in appearance and show no flattening from pressure. The coil glands, especially below the smaller cyst show a little more dilation than was seen by low power The contents of the cyst are fragmented cells which take a homogeneous stain (Mihum Figures 7 and 8)

This is such a common condition that a description other than which appears beneath the

HEART FAILURE WITH HYPERTHYROIDISM*

By E COWLES ANDRUS, M D, BALTIMORE, MD
From the Medical Clinic of the Johns Hopkins Hospital and University

CONGESTIVE heart failure, that is, myocardial insufficiency with edema, is perhaps the most serious complication of hyperthyroidism The idea prevails in the literature that the thyroid secretion in such cases is a specific poison to the heart muscle and the diagnosis of "thyroid myocarditis" or "thyroid heart" appears on many a clinical history And yet one is often impressed by the absence of symptoms and signs of congestive failure in what appear to be the sickest cases The degree of intoxication alone will not explain the development of myocardial insufficiency in these patients

The alternative explanation regards the major effect of hyperthyroidism upon the heart as essentially that of an increased metabolic rate upon a muscular organ This effect becomes peculiarly significant, when, upon that muscular organ, falls no small part of the burden of maintaining an adequate oxygen supply to the entire organism, whose rate of oxygen consumption is also considerably raised The overload thrown upon the myocardium under such circumstances finds no true parallel in exercise, even of hours duration, for in hyperthyroidism the increased demand for oxygen persists, day and night.

Studies of the metabolism of the myocardium have shown it to differ only quantitatively from that of other muscles Its oxygen consumption rises in proportion to the work it performs Signs of failure may presumably develop when the amount of work thrown upon the heart, in proportion to its oxygen supply, exceeds or approaches the limits of its own metabolism These limits are fundamental factors in the cardiac reserve

Under the conditions of hyperthyroidism the capability of the heart to maintain an efficient circulation depends upon three factors—

(1) Duration of symptoms, most important being the increased Basal Metabolic Rate

(2) Age of patient.

(3) Pre-existent or co-existent organic cardiac disease

The present report is based upon 86 cases admitted to the Johns Hopkins Hospital between September, 1925-March, 1928 All patients were carefully studied and prepared for operation upon the medical wards, and such as showed any signs of failure were returned for post-operative observation The diagnosis of organic heart disease was made only when the characteristic physical signs were present after the subsidence of the symptoms of hyperthyroidism following surgical treatment

A general summary is shown in Table I

TABLE I

	Exophthalmic Goiter	Adenomatous Goiter With Hyperthyroidism
Cases	68	18
Average Age	37	38
Average B M R	+45	+47 5
Congestive Failure	13	10

The greater incidence of failure among the cases of what we have classed as adenomatous goiter is of particular interest An important factor in its production may be more apparent when we consider Chart I, showing the duration of symptoms in the two groups of cases, with and without failure In the so-called adenomatous group there is usually a history of symptoms extending back over years and not infrequently a story of one or more previous severe attacks Histologically the thyroids removed from such patients show diffuse hyperplasia. In addition there are nodules which are taken by Rienhoff and others to represent areas of involution, the remains of former exacerbations Here the heart has been overloaded for years, and in some cases has been relieved for a time only to be burdened again at a period when, in the natural course of events, it is becoming less and less able to stand the strain

If now we divide the cases in this series into two groups, under and over 40 years of age, the occurrence of failure assumes an interesting significance as shown in Table II

TABLE II

CONGESTIVE FAILURE WITH HYPERTHYROIDISM UNDER AND OVER 40

	Under 40		Over 40	
	Exophthalmic Goiter	Adenoma	Exophthalmic Goiter	Adenoma
Cases	49	5	19	13
Failure	6	0	7	10

In 49 cases of exophthalmic goiter and 5 cases of adenomatous goiter with hyperthyroidism under 40 only six showed signs of myocardial insufficiency Of these cases five had physical signs of mitral stenosis and insufficiency after the metabolic rate had fallen to normal The sixth patient was a negress of 26 with syphilis of the aorta and early aortic insufficiency, who developed myocardial insufficiency with hyperthyroidism of only 9 months duration They have since returned to the follow-up clinic from 12-18 months after discharge showing the same physical signs At

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y, May 23 1928

were clinically syringo-cyst-adenoma—we were unable to observe where the lesions had been Our result in a case of adenoma sebaceum was quite satisfactory, but not as satisfactory as in syringo-cyst-adenoma, as the former are more deeply situated

We have purposely avoided mentioning our results in multiple benign cystic epithelioma because clinically these cases are indistinguishable from syringo-cyst-adenoma, but since our results have been excellent in syringo-cyst-adenoma we would naturally assume that the results in multiple benign cystic epithelioma would be equally as good if we resorted to the microscope in these cases to clinch our diagnosis

The same may be said of tricho-epithelioma, but these cases are extremely rare

We have had no experience in treating cases of hidrocystoma but judging from the microphotographs as well as from the clinical picture we believe that desiccation is the best and only method for a permanent and satisfactory result

Incision of a milium with a cataract knife and expulsion of the contents by a comedone extractor will give excellent results in practically every case

Adenoma sebaceum—multiple benign cystic epithelioma — tricho-epithelioma and syringo-cyst-adenoma do not respond readily to Roentgen rays, either filtered or unfiltered A few cases of adenoma sebaceum have been shown for the purpose of demonstrating satisfactory results by means of Roentgen rays While these tumors were unquestionably smaller yet the number of treatments necessary to produce a satisfactory result might be offset by injury to the normal skin

It might be summarized by saying that the above mentioned benign tumors are not readily affected by Roentgen rays, therefore, the best results will be secured by means of desiccation but it must be done very superficially with an extremely fine spark

present one individual is forced by dyspnoea on exertion and edema of the ankles to limit her activities

Above 40 the proportion of cases of failure increase sharply Thus among 19 cases of exophthalmic goiter over 40, seven suffered with heart failure and of 13 adenomatous goiters with hyperthyroidism, all but three were similarly afflicted It is scarcely logical to assume as perfect a reaction to protracted strain in the heart of the fifth or sixth decade as may have been the case with the same organ twenty years earlier Hyperthyroidism occurring at this age finds the heart often beginning, if you will to show the effects of wear and tear by a diminished cardiac reserve And if, as in ten of our cases, it appears in the sixth or early seventh decade, when arteriosclerotic heart disease is a not uncommon finding, it would be rather remarkable if evidence of myocardial insufficiency were lacking Gorham has already pointed out the significance of hyperthyroidism as a contributing cause of cardiac failure in older individuals In this series all of 10 cases over 50 showed cardiac failure of some degree Eight of these had diffuse arteriosclerosis and two angina pectoris

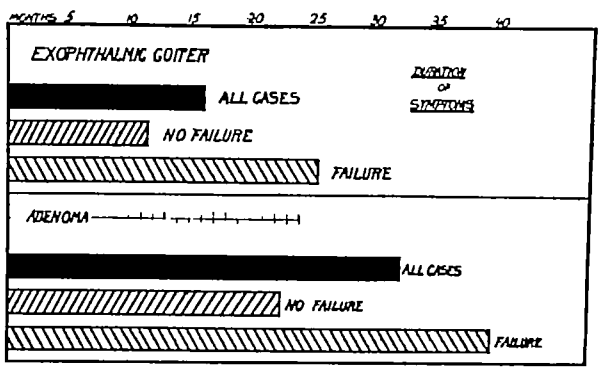

Chart 1 Duration of Symptoms in Cases with and without Failure

TABLE III

ARRHYTHMIAS WITH HYPERTHYROIDISM

Auricular Extrasystoles	1
A-V Block	1
Auricular Fibrillation (Transient)	4
Auricular Fibrillation	10

In Table III is shown the occurrence of cardiac irregularities in this series Transient auricular fibrillation is a not uncommon finding in other series of hyperthyroidism and usually disappears following surgical treatment In this group of cases it was not always associated with failure Established auricular fibrillation occurred, however, in ten cases, all with myocardial insufficiency and nine showing signs of organic cardiac disease after subsidence of symptoms Eight cases reverted to normal rhythm either before or after operation In the remaining two reversion followed the administration of quinidine The mechanism of the production of auricular fibrillation in hyperthyroidism is still obscure but the truth is that once it becomes established, and unless its rate be controlled with digitalis, it presents another and serious handicap to an already overburdened circulation

TREATMENT

A word as to therapy If the heart failure be treated as such, and at the same time the usual agencies be employed to reduce the degree of hyperthyroidism these patients may be prepared satisfactorily for operation Under rest, sedatives, moderate but not extreme limitation of fluids, and digitalis in adequate doses, the signs of myocardial insufficiency can be made to disappear, provided that the patients receive at the same time sufficient amounts of lugol's solution However, a high calorie diet, which is so advisable in hyperthyroidism without congestive heart failure, is not well tolerated in these cases until after the subsidence of symptoms of myocardial insufficiency Usually such arrhythmias as are present disappear following operation Auricular fibrillation, if established may, however, persist after the metabolic rate has fallen to normal In these cases normal sinus rhythm may be restored with quinidine.

SUMMARY

In a series of carefully studied cases of hyperthyroidism congestive heart failure occurred in 26 per cent. Under 40 years of age myocardial insufficiency with hyperthyroidism is far less common than in the later years Moreover when it appears in younger individuals cardiac decompensation is almost invariably associated with preexistent rheumatic or, more rarely, syphilitic heart disease

In the decades above 40 the greater frequency of failure as a complication of hyperthyroidism is associated with three factors

1 The greater incidence of so-called adenomatous goiter, characterized by exacerbations and remission over a period of years,

2 The natural diminution of the cardiac reserve which takes place with the years beyond forty plus the occasional coincidence of rheumatic or hypertensive cardiac disease with hyperthyroidism at this age, and,

3 The coexistence in many patients of fifty and over of arteriosclerotic heart disease

THE DIAGNOSIS AND TREATMENT OF NON-PARALYTIC STRABISMUS*

By CONRAD BERENS, M.D., RAY R. LOSEY, M.D., and ELIZABETH K. STARK, A.M.,
NEW YORK, N. Y.

IN SPITE of the extensive bibliography on the treatment of strabismus many of our intelligent physicians are not well informed in regard to the principles involved, and since it is their duty to instruct the lay public, it seems worth while to present this subject again.

Etiology. The exact cause of strabismus cannot always be determined. There is no doubt, however, that many cases are caused by errors of refraction, particularly marked hypermetropia or far-sight, in which the strain to accommodate often causes convergent strabismus or "crossed eyes." In uncorrected myopia, divergent strabismus or "wall eye" is usually seen owing to the fact that the eyes at rest are focused for near objects, thus abolishing the necessity for accommodation and hence relaxing convergence. Muscular anomalies may be the cause of strabismus and, in some cases, there may exist faulty development of the central nervous mechanism which controls binocular vision and the fusion faculty. By fusion is meant the complicated cerebral coordination which acts to keep both eyes focused on the same point so that we normally see one instead of two objects. If this faculty is fully developed early in life, usually before the seventh year, the ability to judge depth and distance is much more accurate. For this reason as well as for psychological considerations and cosmetic results, it is advisable to cure strabismus as early as possible.

Types—Symptoms and Diagnosis

1. *Congenital Strabismus.* One occasionally observes convergent strabismus in the newborn, but this is the exception rather than the rule. In most instances convergent strabismus is due to injury of the oculomotor nerves or their nuclei, to traumatism, or to inflammation of the extrinsic muscles themselves.

2. *Intermittent or Periodic Strabismus.* In the early stages of the development of strabismus patients are frequently brought to the ophthalmologist because of the occasional turning of an eye, most commonly noticed after close work or when the child is tired. The deviation of the eye may also be apparent when the patient is fixating a near object. Since these are usually the most favorable cases for treatment with glasses and orthoptic exercises, operation may frequently be avoided if the proper treatment can be instituted early.

3. *Constant Strabismus.* Actual constant deviation of the eye is usually noticed between two and five years of age. Cosse[1] has tabulated the ages at which strabismus appears as follows: Before 1 year of age, 28.73 per cent., from 1 to 5 years of age, 61.59 per cent., and of the remainder all except 1 per cent. appear between 5 and 10 years of age. Before the squint becomes permanent the eyes may turn alternately. However, the eye with poorer vision or greater refractive error, usually remains permanently deviated and even though it fixates a small object when the other eye is covered, it immediately reverts to the deviating position when the dominant eye is uncovered.

4. *Alternating strabismus* may be constant or periodic. It is that type of squint wherein the patient fixates now with one eye, then with the other, vision usually remaining good in both eyes.

5. *Vertical strabismus,* constant or periodic, of one or both eyes is more frequently encountered than one would suppose from a study of the literature. For this reason, in addition to measuring the squint by means of a perimeter or one of the many other methods which do not insure accurate fixation, the deviation should be measured by the screen and parallax test and by placing a red glass over one eye and holding prisms base out, in convergent strabismus, and base in, in divergent strabismus, until the images are brought into the same vertical plane. When this has been accomplished we frequently note that one image is higher than the other, then by placing square prisms over the other prism base up or down as indicated, the amount of vertical deviation may be measured by the prism which superimposes the lights. This vertical deviation is often the result of spasm of an inferior oblique which may be secondary to paresis of the superior rectus of the other eye even though in many instances it is impossible to find evidences of paresis.

Treatment

1. *Non-Surgical Treatment and Orthoptic Training.* In the non-surgical treatment of strabismus four important points are to be considered: the correction of errors of refraction, the improvement of the vision of the eye which tends to deviate, and, if possible, the establishment of binocular simultaneous macular perception (simultaneous use of the eyes) with rapid and accurate stereoscopic vision (ability to judge depth and distance). The treatment to be undertaken depends largely on the age of the patient. It is frequently stated that in adults the only course to take is to operate immediately and hope for a good cosmetic result. One should determine first whether the patient can fuse the dissimilar images made by a red glass held over one eye, after the images have been approximated by means of prisms, if he can, good results even in an adult, may occasionally be obtained by exercises. If the exercises are understood before the operation, it may be possible in some instances to obtain binoc-

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N. Y., May 23, 1928.

ular single vision, and in adults possibly slight appreciation of depth, often the exercises afford an initial means whereby the eyes may be maintained in better position One should also pay particular attention to vertical deviations which should be corrected by appropriate prisms and exercises, or by operation

As the wearing of proper lenses often markedly reduces the degree of deviation, accurate determination of the error of refraction and the prescribing of proper correcting lenses is the first step in the treatment of strabismus Children one year old and even younger can be fitted satisfactorily with spectacles, although it is frequently stated in text books that lenses should not be prescribed for children until they are three or four years of age

In squint, since the two eyes cannot fix an object simultaneously, the image seen by the deviating eye is ignored or suppressed in order to avoid the resultant diplopia (double vision) which is unpleasant In most instances vision is poorer in the eye which turns and because of constant suppression, it tends to become worse as time goes on This partial blindness due to disuse is known as amblyopia ex anopsia Measures should therefore be taken as early as possible to force the use of the deviating eye either by cycloplegia or by occlusion of the fixing eye A weak solution of atropin (⅛ to ¼ per cent, one drop in the right or left eye at night) is usually prescribed as a cycloplegic, this should be discontinued as soon as the non-fixing eye begins to fixate If the original deviating eye dominates after the master eye has been released from atropin, it may be necessary to use atropin in this eye, alternating the drops as one eye or the other dominates fixation In true alternating squint with voluntary fixation in either eye a cycloplegic is occasionally used in both eyes In occlusion it is preferable, if possible, to give glasses and obscure the vision of the fixating eye for a few hours each day in order to force the use of the non-fixating eye The patient is instructed to study a test chart and small test type during this period Young children who cannot read may be trained with small toys, other small objects, or with pictures The following are the exercises which we have found useful for amblyopic eyes

Exercises for Amblyopic Eye

Procure from your optician a Snellen Chart (number—letter—illiterate) and a card with Jaeger reading type

Cover the right (left) eye with a patch, or if glasses are worn, paste a piece of thick paper over the right (left) lens Keep this eye covered two hours a day for two weeks and then report to us Practise using the uncovered eye by reading the finest print on the Jaeger test card, and the smallest test letters possible on the Snellen card at a distance of 20 feet Do this times a day for minutes If the patient cannot read, work with small toys and other objects, and pictures, and encourage drawing on a blackboard

Stereoscopic and prism exercises are invaluable training in the simultaneous use of the eyes The stereoscope is fitted in front of the lenses with small springs or clips to hold square prisms, and Kroll, Wells, or Hamblin charts are prescribed When the charts are observed correctly through the stereoscope, the two halves combine to make one complete picture, word, or phrase If the two halves of the charts remain separate throughout the range of the sliding carrier, then prisms base out, in convergent, and base in, in divergent strabismus, are placed in the clips on the front of the stereoscope The patient is instructed to use the weakest prism necessary to combine the charts and to try from day to day to use weaker prisms until the charts can be fused without prisms When this has been accomplished, he is instructed to use the prisms in the direction opposite to that originally prescribed and to increase their strength as rapidly as possible. If there is a vertical deviation and the two halves of the charts are not on the same level, then prisms base up or down are placed in front of either eye until the two parts are superimposed or side by side In the latter case it is necessary to use prisms base out or in as well in order to fuse the charts

Kroll charts, satisfactory for children as young as three years, may be used in any order As the pictures are fairly large and of bright colors, older children and adults suffering from marked amblyopia ex anopsia can often fuse these charts when, with Wells charts, they completely suppress the image of the poorer eye

Wells charts are prescribed for children old enough to read and for adults In this set, there are eight series of charts lettered from A to I (the *D* series is now omitted) As the *C* series is usually found to be the easiest to fuse, patients are instructed to begin with this series but to work with the *A* charts at the same time The *E* series is designed to produce the effect of depth or distance As the ability to discriminate depth or distance is usually late in developing and often is not manifest until fusion exercises have been continued over a long period of time, it is necessary for most patients to go on to the *F* and *G* series after the *C* and *A* series are easily fused and to go back to the *E* charts from time to time to determine whether they have a third dimension In the *H* and *I* series the distance between the centers of the two halves of the charts varies from 2 5 cm to 11 cm Divergent cases work toward the lower numbers, convergent cases toward the higher numbers B-1 is first inserted in the stereoscope to determine with which card of the series to begin This is given by the number of the dot directly below the arrow

Hamblin charts afford a means of obtaining variety and stimulating interest in children who soon become bored with the limited assortment of Wells charts They are furnished in two series of 134 charts each, arranged in thirteen sets of increasing difficulty, one series is designed for convergent cases (convergent series), the other for divergent cases (divergent series) They are used according to very specific directions supplied with them In general, their principle is similar to the *H* and *I* series of the Wells charts The distance between the two halves of the charts varies, and is decreased in the divergent, and increased in the convergent series The Worth illuminated amblyoscope is also useful in training children to fuse

Patients with convergent strabismus (crossed eyes) who can appreciate diplopia, i e , who can see two lights (a red and a white light) when a red glass is held over one eye are given the following exercises to increase the range of fusion and to strengthen the external recti muscles Children under five years of age can rarely do this exercise satisfactorily and cases of marked amblyopia ex anopsia must often persist in the amblyopic exercises for some time before the two lights can be seen

Diverging Exercises by Recession with Prism and Red Glass

Procure from your optician a set of square prisms, numbers 1, 2, 3, 4, 5 and 10 diopters and a red glass the same size as prisms

Place a lighted candle, or preferably a small flashlight, or a ½ inch opening on a black card before an electric light bulb on a level with the eyes If distance lenses have been prescribed, wear them

Approach the light from a distance of ten feet, holding the red glass before one eye, preferably before the one with poor vision or the one which is used less Two lights, one red and one white, are usually seen, the red one on the same side as the red glass—walk backwards or forwards until the lights are as close together as possible If one light is above the other, tilt the head slightly to the right or left and endeavor to make the red and white lights come together into one reddish white light If the lights cannot be fused place square prisms base up or down before either eye until the lights are on the same level

When the lights do come together, walk slowly away from the light trying to hold the lights together as one reddish white light as long as possible. When the lights separate repeat the procedure and continue the exercise until the lights have been brought together and have separated — times When this exercise has become easy and you are able to walk back 25 feet from the light, holding the red and white images together place the No 1Δ square prism with its thick end (base) toward the nose. If the lights can be brought together with this prism, proceed to the next stronger and increase the strength of the prism held before the eye until you have reached the strongest one you can use and still hold the two lights together Then repeat the exercise times times a day, increasing the strength of the prism whenever possible

If the patient has divergent strabismus (wall eye) the following directions are given for converging exercises with prisms and a red glass in order to increase the strength of the internal recti muscles

Converging Exercises with Light and Red Glass

Procure from your optician a set of square prisms, numbers 1, 2, 3, 4 5, 10Δ and three 20Δ prisms, with a red glass of the same size Also procure a small flashlight or use a lighted candle Hold the red glass over one eye and observe the light on a level with your eyes Walk toward or away from the light until the red light seen with one eye, and the white light seen with the other can be brought together to form one reddish white light As soon as this can be done, walk towards *the light until it is impossible to keep the lights* from separating Now go back and come forward again, trying to approach as close as possible to the light before doubling occurs Repeat this approach times times a day

If at a distance the lights cannot be brought together, then place the weakest prism with its thick end (base) toward the nose If this does not bring the lights together use the next stronger prism, increasing the strength until that one is found which does permit them to be brought together Now walk up to the light until two lights are again seen Walk back and then forward, repeating this procedure times at each exercise, decreasing the strength of the prism as rapidly as possible If one light is so far above the other that the lights cannot be fused by tilting the head to the right or left, hold square prisms base up or down before either or both eyes until the lights are on the same level

As soon as the lights can be held together without using a prism, try turning the prism around, and starting with a 1Δ prism (thick end toward the temple) increase the strength of the prism in this position as rapidly as possible This exercise may be repeated 10 to 100 times, two or three times a day according to the degree of strain or fatigue produced

These exercises are particularly useful before and after operation Most satisfactory results are obtained when they are combined with regular practice periods at the office The following exercises are prescribed to strengthen abduction (the power to turn either eye outward)

Abducting Exercises for Esophoria (Crossed Eyes)

1 Hold the head still, cover the left eye, and with the right eye look fixedly at a small light

or white headed pin while moving the pin to the right as far as the eye can follow it Repeat exercise times times a day Duplicate the procedure covering the right eye and moving the pin or light to the left

2 Mark several small cards with one, two or three stars, dots, dashes, crosses or other symbols Mix the cards, pick one up and without looking at it, hold it on a level with the eyes about 14 inches to the side of the right (left) ear Holding the face straight forward, turn the right (left) eye outward and try to recognize the symbols as they are gradually carried forward Repeat the exercise with the other eye Do this times a day

When binocular simultaneous macular perception (the simultaneous use of the eyes) has been obtained, the following exercise directions are given starting with prism base in, in convergent, and base out in divergent, strabismus When wide amplitude of fusion (when the eye can fuse lights separated by prisms) has been obtained in this manner, both diverging and converging exercises are used

Directions for Prism Exercises

(a) Prism Exercise for Distance—Procure from your optician 1, 2, 3, 5, 10, 20, 20, 20Δ square prisms and a square piece of red glass, the size of a prism Hold the weakest one (lowest number) thick end, or base in (out) before either eye and the red glass before the other eye, *both eyes open* Place a lighted candle or black dot one inch in diameter on a white paper on a level with the eyes ten or preferably twenty feet away (While using a red glass always use a light) Close the eyes, open them, and if two images are seen, try to make the two images appear as one Use the next higher prism in the same manner until the strongest prism has been found through which flame or dot appears single Stronger prisms are obtained by placing additional prisms base in (out) before the other eye, or by holding the bases of the prisms together over the same eye Exercises should be done for distance while wearing distance lenses and exercises for ten inches while wearing distance lenses or reading lenses if prescribed Repeat the exercise times a day, times at each exercise, times base in (out) before the right eye and times base in (out) before the left eye, with strongest prism which permits binocular single vision

(b) Prism Exercise for Near—(1) Repeat exercise (a) with candle or black dot on white card 1/16 inch in diameter, ten inches from the eyes, twenty times at each exercise

The following exercise is given to improve converging power and is particularly useful if the near point of convergence is remote (The near point of convergence is the closest point to the eyes in which the eyes can simultaneously fixate a small object)

Converging Exercises

Bring a small white headed pin or 1/16 inch black dot on a white card slowly up to the eyes until doubling occurs, then hold pin or dot at arm's length again and repeat the exercise Do this 15 times times a day

The following exercise is given to increase the power of accommodation (Accommodation is the automatic adjustment of the eye for seeing at different distances)

Exercises for Accommodation

Hold fine print 14 inches from the eyes Carry the print up to the right eye and left eye separately and then to both eyes, until blurring occurs Repeat each procedure times at each exercise period Exercise times a day

N B—Do not exercise if overtired, and stop exercises if eyes pain or feel strained Apply hot water to the eyes followed by cold after exercising

Results of Non-surgical Treatment—Certain cases of strabismus will be cured by carefully correcting the refractive error and persisting in the exercises Some patients may be cured without treatment, this is particularly true of those in whom the squint appears about the age of three or four years, and disappears toward the age of six or seven years The growth of the individual and the development of the face seem to aid in correcting strabismus Although it is possible that some patients are cured spontaneously, it is true that this is so rarely the case that nature unaided should never be relied upon to preserve the important function of binocular vision Squint appearing in the first or second year may be caused by a nerve lesion, a tumor, or an ocular disease, but unfortunately through ignorance many such patients are not referred to ophthalmologists before vision is lost

We take issue with some authors who say that the ophthalmologist should not insist upon operation for older patients who have strabismus since it is done only for cosmetic effect Older patients will occasionally obtain useful binocular vision and in some instances fairly accurate stereoscopic vision, provided proper exercises are instituted before and after operation To allow a patient to go through life with one eye completely turned results in a large area of the brain not being used to its full capacity and the marked impairment of the ability rapidly and accurately to judge distance In addition to this, not only with regard to girls and young women, but likewise among boys and young men, we must take into account the unfavorable mental and emotional condition produced by the consciousness of their defect Relief from the embarrassment caused by the remarks of others and the strain due to suppressing impressions from the non-fixing eye permits them to concentrate

on essentials with the result that many patients, after squint has been properly corrected, advance rapidly in their studies and become more normal in their outlook Their improved appearance is of benefit not only to themselves but likewise to those with whom they are closely associated

Surgical Treatment—There are two fundamental procedures in the surgical treatment of strabismus One is the decreasing of the action of a muscle by tenotomy or one of its modifications, the other is the increasing of the action of a muscle by resection, advancement, or tucking It is advisable to strengthen muscular action whenever possible and we perform resection or tucking in preference to advancement When muscular action is to be decreased retroplacement is performed, or in rare instances a partial tenotomy, but practically never a complete tenotomy, except of the inferior oblique In selecting the operation suitable for a given condition stress is laid upon the relation between convergence and divergence, the absolute and relative near point of convergence, the decreased or increased action of the individual muscle before operation, and the appearance of the muscle at operation Retroplacement is usually performed if the patient has good converging power or marked spasm of the internal recti Retroplacement (cutting the muscle free and suturing it to the eyeball a certain number of millimeters from the original insertion) is also indicated if, after exercising the external recti by abducting exercises, there is no limitation of external rotation as studied with the perimeter and the field of monocular fixation or with the tropometer If, on the other hand, poor converging power and limited adduction are found after appropriate exercises, and there is no spasm of the internal recti, a modified Reese[2] resection operation is frequently performed

If there is a marked upward deviation of one or both eyes due to spasm of the inferior oblique we usually perform a tenotomy or myectomy of the inferior oblique or obliques An incision is made (as suggested by Boyer[3] in 1842) through the inferior nasal third of the lower conjunctival fornix, exposing this area by traction on sutures placed through the tarsal conjunctiva and through the conjunctiva in the inferior nasal quadrant immediately adjacent to the cornea If the incision is made directly towards the orbital margin and a tenotomy hook passed from the temporal side up and in nasally, then drawn forward, the inferior oblique muscle may be exposed and tenotomized or resected as the operator prefers It is a question whether greater effect is obtained by myectomy or by tenotomy of the inferior oblique

The technic used in performing the resection operation is two mattress sutures of No 5 twisted paraffined silk in the muscle and muscle stump, then through the conjunctiva, tying the sutures between the cornea and the stump and closing the wound in the conjunctiva with a continuous running suture starting and ending in the caruncle No reason is evident for advancing a muscle, as the muscle adheres to the old insertion and the muscle fibres anterior to this point atrophy, and therefore can have no effect in increasing the rotation of the eyeball In performing tenotomy, one of the forms of the lengthening operation has been done for years, but since Jameson[4] published his recession operation with scleral fixation and referred to Curdy's recession with advancement, a technic suggested by one of us (C B)[5] has been used This operation, which uses the muscle stump as well as the episcleral tissue for fixation, is similar to Agatston's[7] operation and is named retroplacement The technic can best be visualized by referring to Figure 1

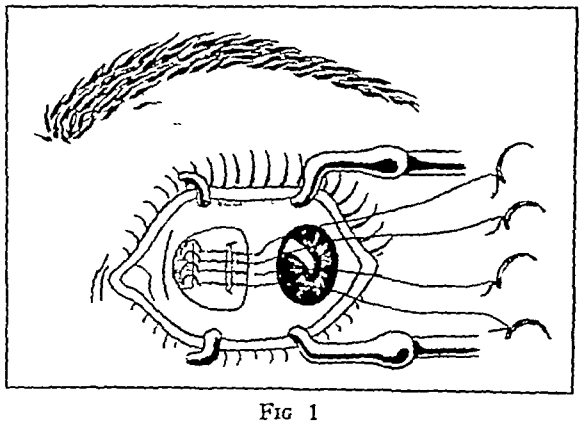

FIG 1

The exact distance of proposed retroplacement of the muscle has been measured from its point of attachment and the sutures have been passed through the episcleral tissue at this point, then through the muscle stump and conjunctiva The conjunctiva is then closed by a running suture

Results with retroplacement have been so good that we seldom perform resection unless the converging power is weak or adduction is limited

Summary of Results of Retroplacement Operation

Office Patients, 36, Clinic Patients,* 18, Total Number, 54

	Office Patients		*Clinic Patients*	
	No	*Per Cent*	*No*	*Per Cent*
Exercised after operation	30	83⅓	2	11
With one amblyopic eye (vision 20/70 or less)	14	39	4	22
With binocular simultaneous macular perception	18	50	2	11
With stereoscopic vision	13	36	0	0

* The majority of the clinic patients were from the service of Doctor Berens at the New York Eye and Ear Infirmary but several of them were operated on through the courtesy of Doctor George H Bell

General average of prism dioptres correction by resection and recession			4 6△

Conclusions

1 Lenses may and should be worn, if needed, as soon as strabismus is noticed and retinoscopy can be performed

2 There is no definite time when operation should be performed, in some cases, it should be done as soon as other forms of treatment prove ineffective If the use of atropin does not improve the deviation, particularly if the position of an eye practically precludes its use, operation should be performed even in children two or three years of age

3 If orthoptic exercises are given before and after operation and proper attention is paid to vertical deviations, many patients, even young adults, may obtain binocular simultaneous macular perception, and some of these may acquire fairly accurate depth perception We believe that obtaining binocular single vision and amplitude of fusion are important factors in maintaining the eyes in proper position and that efforts should be made to this end

4 Every patient who develops squint should be immediately examined under a cycloplegic by an ophthalmologist as one cannot be sure of the cause, it may be a disease of the central nervous system secondarily affecting the eyes, a congenital anomaly, or even a tumor or inflammatory disease of the eye

5 Early treatment improves the prognosis in regard to the retention of useful vision in the deviating eye and favors the development of stereoscopic vision

6 The recession operation has given more encouraging results than any other single operative procedure used as it affords an accurate method of limiting the action of the overacting muscles

TREATMENT OF ACNE VULGARIS WITH CALCIUM*

(*Preliminary Report*)

By DAVID BLOOM, M D, NEW YORK, N Y

From the New York University Medical College, Department of Dermatology and Syphilology (service of Dr Howard Fox), and Mount Sinai Hospital, Department of Dermatology and Syphilology (service of Dr Hermann Goldenberg)

IT seems to me that we cannot be perfectly satisfied with the present treatment of acne vulgaris It is true that the Roentgen ray is an excellent remedy from a practical point of view But it is not quite satisfactory theoretically if we analyze its action The way the rays act, namely, by means of quieting sebaceous gland activity, is not compatible with an ideal treatment of a disease like acne Acne is not merely a local disease but a systemic, metabolic or endocrine disorder produced by the critical change of the organism at puberty, a period of life in which the needs of the body become modified in regard to substances delivered by the endocrine glands and a disturbance in the functions or in the balance of the glands is likely to take place The hyperfunction of the sebaceous glands with the hyperkeratosis of the follicles and the resulting comedones, papules and

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 23rd, 1928

pustules in which the skin disturbance of acne manifests itself, form only symptoms of a disease The rays affect these symptoms but do not affect the underlying condition of the organism

We ought therefore to investigate other remedies for acne which might have an influence on the forces behind this disturbance the endocrines, the autonomic nervous system or the general metabolism in the body I shall disregard here the treatment of acne by gland extracts which were tried by some with success [1] The purpose of this paper is to report observations on the effect of calcium in acne This drug, which is one of the most important inorganic substances influencing cellular activity and which seems to be intimately connected with the physiological function of the autonomic nervous system, has been used for many years in numerous diseases, especially in systemic troubles and in those in which the autonomic nervous system was believed to be at fault It was taken up frequently with enthusiasm and abandoned with disappointment Of the many findings reported in literature regarding the action of calcium I shall mention only a few which seem to have relation to the present topic, giving us some theoretical basis for the use of calcium in acne

From the animal experiments carried out by Chiari and Januschke and reported in 1911,[2] it follows that calcium seems to influence favorably, or to prevent altogether, inflammatory conditions This is probably due in part to the ability of calcium to increase phagocytosis and to lessen the permeability of the smallest blood and lymph-vessels to plasma and blood corpuscles [3]

There is evidence, based on extensive studies, which favors the importance of calcium in its relation to the autonomic nervous system The equilibrium between calcium and potassium ions around and in the cell, without which the cell would not function normally, is established by the autonomic nervous system But it is also true that the action of the autonomic nervous system is dependent upon the ions themselves For an increase in the potassium ions produces the effect of vagus stimulation, increase in calcium ions the effect of stimulation of the sympathetic nerve [4]

Considering the generally accepted correlation between the endocrine glands and the autonomic nervous system, it seems, from the above, that there is some theoretical justification for testing calcium in acne

The finding of Levin-Kahn[5] and others, that the calcium content of the blood in acne is not decreased does not contraindicate theoretically the use of calcium It is nevertheless possible that there is a disturbance in the ion content or ion equilibrium in the cells, without the calcium content of the blood showing it The calcium metabolism of the body seems to be of too complicated a nature to be measured by the calcium content of the blood alone Bio-chemistry cannot yet furnish an exact explanation of the condition of the calcium ions in the living cell and of their relation to other ions Thus a perfect theoretical justification for trying calcium medication in acne is not yet possible

But even disregarding the above, it is justifiable to investigate the effect of calcium in acne, in order to confirm or deny the findings of Dr Sirota He reported[6] in 1927, the results of his treatment of acne vulgaris with calcium, not mentioning however the number of cases treated After 20 intravenous injections of 5 cc of a 10 per cent solution of calcium chloride, administered every third day, he was able to clear up every case of acne

In my own tests I also used a 10 per cent calcium chloride solution which was sterilized by boiling and administered intravenously In the first cases treated 5 cc were given every third day Soon the amount was increased to 10 cc every second day The intravenous injection must be given slowly, the patient should preferably be lying down, especially during the first few injections when he is not yet accustomed to the peculiar heat sensation produced by calcium chloride, and is liable to faint As soon as the patient complains of a sensation of heat in the face, the injection must be stopped until the heat sensation, which spreads from the face to the body and lasts about 30 seconds, disappears The injection is then resumed Great care should be exercised not to infiltrate the skin or the hypoderm, as even slight infiltration is very painful, and may incapacitate the patient for some time. There is also danger of necrosis when tissue is infiltrated Most of my patients received about 20 injections but I am now giving more than 20 in order to see if better results may be obtained in every case by prolonged administration of the drug

Summary

Thirteen patients were treated, 7 males and 6 females The age ranged from 16 to 30 years The type of eruption varied from mild acne with a moderate amount of comedones, papules and pustules to a severe indurated and pustular acne The duration of the eruption ranged from 8 months to 8 years, an average of 3 years and 5 months From 6 to 21 injections were given, an average of 17 injections Nine patients received treatment twice a week, four three times a week In one patient treatment was begun with 2 cc and gradually increased to 5 cc Four patients received 5 cc. at each injection In 8 cases treatment was begun with 5 or 6 cc and increased to 10 cc The result of the treatment in one marked case of pustular acne was 90 per cent improvement in the face eruption, less improvement in the acne of the back This case cleared up perfectly after 12 injections, but a few lesions reappeared later on Four patients responded with

CLINICAL APPLICATION OF THE FEMALE SEX HORMONE TEST*

By ROBERT T FRANK, M D, F A C S, and MORRIS A GOLDBERGER, M.D., NEW YORK, N. Y

From the Gynecological Service and Laboratories of Mt. Sinai Hospital New York N Y

INTRODUCTORY

IN the human female as in all the higher vertebrates there is a sex cycle In the anthropoids, of which the human female is the highest in the scale, the infertile or abortive sex cycle culminates in menstruation, the fertile sex cycle in labor

The mechanism of the sex cycle is a complicated one, for the details of which, in this short paper, it is necessary to refer the reader to our other articles (1, 2, 3) In briefest abstract, three different but correlated and concordant mechanisms must be kept in view

The basic and activating force, in the adult, is the ovary, in which during the infertile cycle, the primordial follicle matures, ruptures (ovulation) and forms the corpus luteum This, after a brief period of physiological activity, regresses and disappears through the medium of a scar, the corpus albicans In the fertile cycle also, the follicle matures, ovulation takes place, but for as yet undetermined reasons, the corpus luteum persists during pregnancy In addition, the placenta subsequently forms and continues the secretion of the female sex hormone previously supplied by the ovary, the compound action of which endocrine organs we designate as "the gestational gland" (2)

Under the direct influence of the ovary (and in the fertile cycle of its successor, the placenta) the tubular system of the female undergoes cyclical changes The tubular system which reacts to the hormonal influence includes the vagina, uterus, fallopian tubes and additionally, the breasts As a result of ovarian influence, the endometrial lining of the uterus, when menstruation is impending, is divisible into a thick, glandular, so-called functional layer and an unchanged basal layer If, as happens during the abortive cycle, impregnation fails to occur, as soon as the corpus luteum becomes physiologically inactive (approximately from 10 to 14 days after ovulation), this functional layer is cast off piece-meal and the menstrual bleeding takes place

In the fertile cycle, on the other hand, impregnation having occurred, the premenstrual preparation of the uterine mucous membrane continues as in the abortive cycle, but because of the impregnation the corpus luteum continuing to remain active, the uterine endometrium continues its decidual change, imbedding of the ovum in the endometrial decidua occurs, and pregnancy is well under way The chorion-epithelium from the earliest stage on, secrets the active substance, which later on is secreted in huge amount by the fully formed placenta throughout pregnancy, thus maintaining the decidual reaction of the endometrium and producing the tremendous hyperplasia of the uterine and vaginal musculature occurring during pregnancy, as well as accounting for the breast changes necessary for nutrition of the newborn

And finally we come to the cycle which interests us most in the present connection, namely the blood cycle, which we have discovered and described in the human female (8) and which also occurs in the lower animals (9)

From the time that menstruation has begun, until about 10 days before the next menstrual cycle, very little female sex hormone, as the active substance responsible for feminineness is termed, can be found in the circulating blood From then on a rapid increase in concentration can be noted until the onset of menstruation. With the onset of the bleeding, the hormone rapidly disappears from the circulating blood but during the first few hours is noted in great concentration in the menstrual blood (5 times that in the circulating blood) Until recently we were, however, at a loss to account for the rapid disappearance of the hormone from the circulation as the small amount of blood shed in menstruation did not appear to account for this Investigators have now demonstrated the presence of the hormone in large amount in the urine (10, 11) Premenstrually the renal threshold for the hormone is greatly lowered as is shown by as yet unpublished results of studies which are engaging our attention at the present time

In the fertile cycle, the hormone found in the circulating blood accumulates as in the infertile cycle toward the time of expected menstruation But, nidation having taken place, there is a sudden diminution of the blood hormone level which we cannot at present explain Not until the sixth and one-half week or seventh week of gestation do we again find a demonstrable amount of the hormone in the circulating blood and from then on until labor a high level is maintained throughout pregnancy Another strange phenomenon is the fact that during pregnancy huge, in fact astound-

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 23, 1928

Loeb (4) has shown that the influence of the corpus luteum is necessary for sensitizing the endometrial mucosa so as to enable it form the maternal part of the placenta

Papanicolaou (5), Parkes (6), and also Weichert (7) have described corpus luteum extracts which postpone the estrual cycle.

Consequently there are two factions, the one claiming that the follicle, corpus luteum and placenta secrete a single hormone, the other believing that the corpus luteum does not secrete the female sex hormone but only an inhibitory substance, and that there are at least two distinct genital hormones

	Name	Age	Sex	Severity and Type of Acne	Location	Duration (Years)	Total No of Injections	No of Injections Weekly	No of cc at Each Injection	Result in Percent of Improvement	Remarks

2	R.J	16½	M	Marked, papulo pustular	Face and back	2½	13	2	5	50	Improvement started after 5 injections
3	F.S	16	M	Marked, papulo pustular	Face	1	10	2	5–10	50	Improvement started after 4 injections
4	B.A	19	M	Very severe pustular indurated	Face	2	6	2	5	35	Improvement started after 2 injections
5	F.M	20	F	Moderate indurated pustular	Face	5	21	2	5	60	
6	J.H	21	F	Moderate indurated pustular	Face	3	18	2	5	75	
7	W T	24	F	Marked indurated pustular	Face and trunk	4	20	2	5–10	50	
8	A.E	30	F	Severe pustular	Face and trunk	6	20	2	5–10	90	Face cleared perfectly after 12 injections. Slight recurrence later
9	S.M	19	M	Very severe indurated pustular	Face and neck	2½	20	3	6–10	75	Improvement started after 2 injections
10	M.J	18	M	Marked indurated pustular	Face	8 mths	20	3	6–10	75	Patient receiving more treatment. Continues to improve
11	McK M	16	F	Moderate papulo pustular	Face	3	20	3	5–10	75	
12	H.P	25	M	Moderate papulo pustular	Back	8	9	2	5–10	50	
13	K.J	19	M	Severe papulo pustular	Face	4	20	3	5–10	35	

a 75 per cent improvement, three of them after 20 injections and one after 18 Two of those had a marked indurated and pustular acne One responded with a 60 per cent improvement after 21 injections, 5 with a 50 per cent improvement after 10 to 13 injections One responded with 35 per cent improvement after 6 injections but another after 20 injections

The improvement consisted in diminution of the size and depth of the lesions, decrease in number of lesions and diminution in the oiliness of the skin No other treatment was given except washing with hot water and soap, and in some cases applications of hot wet towels In one patient Iron and Arsenic was administered

Conclusions

The results of the above observations, in 13 cases, do not correspond to the excellent results of Sirota, who reports cures in all patients treated But the disappearance of almost all papules and pustules in some of my cases, and marked improvement in many of them, diminution of the oiliness of the skin and even disappearance of comedones after a series of 20 injections or less, is striking enough and worth further investigation

Because of the small number of cases, and the inadequate period of treatment and observation, I am perfectly aware of the preliminary nature of this report More cases will be studied and prolonged observations made, checked up by photographs taken before and after treatment, in order that scientific data may be gathered as to the undoubtedly favorable effect of calcium in acne

Further observation confirmed our diagnosis of pregnancy

When a 3 or 3+ is obtained, the question naturally arises whether the positiveness of the reaction signifies impending menstruation or beginning pregnancy Under these conditions the clinical findings, especially the size of the uterus must be taken into account If menstruation is impending, the bleeding should begin within at most 5 days of the time the blood has been taken A 4, on the other hand, almost invariably signifies pregnancy, although on one or two occasions, marked hyperactivity of the ovaries, usually accompanied by physical and psychical symptoms of "tension," has given a 4 (as shown in case 1151 further on)

"Pregnancy? Fibroids?"

No 1485, 42 years, IV para, had regular menses Denied the possibility of pregnancy Her uterus was enlarged by two fibroids each the size of an orange.
Last menstruation—9-29-27
Blood taken—11-22-27 = 4
Diagnosis 7 weeks pregnancy, confirmed by subsequent observation
(No 1373 is almost identical with the above)

"Pregnancy vs Fibroids"

No 1614 Blood sent to us from another hospital Obstetrical service said fibroids, gynecological service made diagnosis of pregnancy, was bleeding
Blood received—2-24-28 = 4
Diagnosis of pregnancy made
Informed she has carried through (5-10-28)
"Obesity Impending menopause? Spotting"
No 1581, 39 years, IX para, has been regular 28 days, severe flushes, sweats, dizziness, staining continuously Huge abdomen defying examination
Last regular period—10-25-27
Blood taken—1-25-28 = 3+
Blood taken—3-29-28 = 3+
Diagnosis of pregnancy made on 1-25-28
(Case No 1497, weight 218 lbs, diagnosis was made in 8th week)

3 Varia Diagnoses in Pregnancy Including Death of Fetus

No 1320, *"Missed Abortion"*
O para, regular 28 day cycle
Last menstruation—8-16-26
Examined and found pregnant—10-11-26
Re-examined, uterus size 10 weeks 2-23-27
Blood taken 3-9-27 = 0
Diagnosis of dead fetus, missed abortion
Uterus emptied 4-4-27
(Case No 1232 identical with history of 7 months, fetus size of 3 months)
No 1469, "Threatened abortion, fetus alive or dead?"
Staining since 10-9-27
Last menstruation 8-30-27
Blood taken 11-4-27 = 0
Diagnosis of dead fetus and complete detachment
Passed fetus and placenta spontaneously 11-5-27

No 1403, "Retained Placenta?"
Patient delivered at home of dead fetus at term on 5-9-27 History of placenta not coming away Blood taken 5-26-27 = 3 This confirmed the history Manual removal of entire placenta 17 days post partum

In patients with absolute and permanent contra-indications to bearing children, we have in the last few years, induced abortion by means of *x*-ray exposure (14) At times it is important to be sure that the fetus is dead as the products may be retained a number of weeks after the death of the fetus, the entire products being then expelled without febrile reaction "en masse," resembling a "missed abortion"

No 1370, "Hyperthyroidism, *x*-ray Abortion Is the fetus dead?"
36 years, III para, basal metabolism +26
Last menstruation—2-27-27
Blood taken—4-23-27 = 4
x-ray given—4-26-27
Blood taken—5-4-27 = 3+
Blood taken—5-25-27 = 0
Showing that eight days after the treatment the pregnancy reaction still existed but that thirty days later death of fetus and detachment of the placenta had occurred

No 1108 contrasts with the above
"Spinal Cord Tumor Recently Removed, Paraplegia, Pregnancy" Helpless, 4 months pregnant, *x*-ray abortion attempted though it was realized that with the extreme obesity and advanced gestation the attempt might prove futile
x-ray given—2-18-26
Blood taken—4-19-26 = 2½+
Diagnosis of continuation of pregnancy
This was confirmed when uterus was emptied per vaginam

4 Miscellaneous Diagnoses

A few more striking instances have been selected to show the usefulness of the reaction in general diagnosis We desire to emphasize that the laboratory findings are recorded solely by number without our knowledge of the clinical data. For the final interpretation, however, blood readings, clinical data and physical examination may have to be co-related

No 1455—"Obesity, Amenorrhea, Pregnancy?"
25 years; I para, always regular, weighs 239 lbs
Last menstruation—4-4-27

ing, amounts of hormone are excreted daily through the kidneys and bowel (11) the amounts reaching as high as a thousand mouse units in the urine and up to six thousand mouse units in the feces *

The Blood Test

In order to make plain what is to follow, it is necessary to give you a summary of the method employed for determining the presence of the hormone

For the sake of brevity, we shall confine our description entirely to our blood test (12) (1) 40 c c of blood are abstracted from an arm vein and (2) at once injected into anhydrous sodium sulphate spread out in a petri dish By intimately mixing with this dehydrating powder the blood dries rapidly (3) Two extractions of the dried powder are made with ether in a separating funnel, the ethereal extracts being poured off from the sludge (4) The ether is rapidly driven off by means of an electric fan (5) The resultant dry powder is taken up sterilely in 2 c c of sterile water and injected in three divided doses into a castrated mouse (castration performed at least two weeks before) (6) After 24, 36 and 48 hours, vaginal spreads are taken from the injected mouse

Readings are taken of these spreads, a negative spread consisting mainly of leucocytes = 0, a slight reaction in which the leucocytes are greatly diminished and many nucleated epithelial cells are found is called =2, a threshold reaction shows itself by the absence of leucocytes and presence of nucleated epithelial cells, = 3, while a strong reaction documents itself by a smear consisting solely of non-nucleated squamous cells, = 4

Using this reaction, we have examined the blood of over 600 normal and diseased women Today we shall limit our description to a small number of cases, selected for the purpose of illustrating the value of our reaction as an aid to diagnosis, prognosis and therapy

Illustrative Cases

1 Evaluation of Amenorrheas

Primary amenorrheas (never menstruated) may be due to malformations such as absence of tubular tract (vagina, uterus) to subnormal ovarian action (subthreshold) which conceivably may be stimulated to normal, or to absence of ovarian action (no cycle) The prognosis will, of course, depend on the underlying cause

Secondary amenorrheas, irrespective of their length of duration, on analysis may show absence of cycle, subthreshold cycle, or, as in the last case of this group, impending menstruation

No 1608—"Primary Amenorrhea—Sex?"
25 years, S , never menstruated No vagina or uterus, typically feminine in body and psyche

Blood taken
2-18-28 = 3
6 days later = 0
5 " " = 0 This shows a 33
7 " " = 0 day cycle
8 " " = 0
7 " " = 3

No 1406—Primary Amenorrhea
26 years, S , never menstruated, virilism, hirsutes, large hands and feet
Blood studied 12 weeks, subthreshold, irregular cycle (2+)
Prognosis doubtful

No 1615—"Primary Amenorrhea"
26 years, M , never menstruated, eunuchoid, hirsutes
Blood studied 3-12-28 to 4-22-28 = 0
No cycle, prognosis very poor

No 1258—"Menopause? Pregnancy? Amenorrhea?"
43 years, VI para, uterus moderate in size
Last menstruation 10-3-26
Blood taken 12-4-26 = 3
Menstruated 12-5-26
In this case the test might have mislead, being interpreted as an early pregnancy, but in conjunction with a normal sized uterus we predicted impending menstruation We have encountered a number of similar cases

2 The Diagnosis of Pregnancy

As mentioned previously, the hormone level in the circulation immediately after conception and until the seventh week of pregnancy is low (= 0), but then rapidly rises to 3, 3+ or to 4, remaining high until the onset of labor

By means of our test we have been able to diagnosticate pregnancy in the presence of irregular bleeding, complicating uterine tumors, obscuring obesity and other confusing conditions

In case No 1394, irregular menses and hyperthyroidism were present
"Irregular menses" every 2-3 months, 29 years, II para
Last menstruation—3-28-27
Blood taken—5-13-27 = 0
Blood taken—5-27-27 = 4
Showing absence of positive reaction at six and one-half weeks, becoming positive before the eighth week This patient aborted at the sixth month

No 1496, 27 years, I para—menstruation every 6-8 weeks, said that she could not be pregnant
Last menstruation—9-29-27
Blood taken—12-5-27 = 3

* From 4-8 M U = 1 Rat U A rat unit is the amount of active substance required to produce a full estrous spread in a castrated rat weighing 140 gms, (†20 gms) (13)

Further observation confirmed our diagnosis of pregnancy

When a 3 or 3+ is obtained, the question naturally arises whether the positiveness of the reaction signifies impending menstruation or beginning pregnancy. Under these conditions the clinical findings, especially the size of the uterus must be taken into account. If menstruation is impending, the bleeding should begin within at most 5 days of the time the blood has been taken A 4, on the other hand, almost invariably signifies pregnancy, although on one or two occasions, marked hyperactivity of the ovaries, usually accompanied by physical and psychical symptoms of "tension," has given a 4 (as shown in case 1151 further on)

"Pregnancy? Fibroids?"

No 1485, 42 years, IV para, had regular menses Denied the possibility of pregnancy Her uterus was enlarged by two fibroids each the size of an orange
Last menstruation—9-29-27
Blood taken—11-22-27 = 4
Diagnosis 7 weeks pregnancy, confirmed by subsequent observation
(No 1373 is almost identical with the above)

"Pregnancy vs Fibroids"

No 1614 Blood sent to us from another hospital Obstetrical service said fibroids, gynecological service made diagnosis of pregnancy, was bleeding
Blood received—2-24-28 = 4
Diagnosis of pregnancy made
Informed she has carried through (5-10-28)
"Obesity Impending menopause? Spotting"
No 1581, 39 years, IX para, has been regular 28 days, severe flushes, sweats, dizziness, staining continuously Huge abdomen defying examination
Last regular period—10-25-27
Blood taken—1-25-28 = 3+
Blood taken—3-29-28 = 3+
Diagnosis of pregnancy made on 1-25-28
(Case No 1497, weight 218 lbs, diagnosis was made in 8th week)

3 Varia Diagnoses in Pregnancy Including Death of Fetus

No 1320, *"Missed Abortion"*
O para, regular 28 day cycle.
Last menstruation—8-16-26
Examined and found pregnant—10-11-26
Re-examined, uterus size 10 weeks 2-23-27
Blood taken 3-9-27 = 0
Diagnosis of dead fetus, missed abortion
Uterus emptied 4-4-27
(Case No 1232 identical with history of 7 months, fetus size of 3 months)
No 1469, "Threatened abortion, fetus alive or dead?"
Staining since 10-9-27
Last menstruation 8-30-27
Blood taken 11-4-27 = 0
Diagnosis of dead fetus and complete detachment
Passed fetus and placenta spontaneously 11-5-27

No 1403, "Retained Placenta?"
Patient delivered at home of dead fetus at term on 5-9-27 History of placenta not coming away Blood taken 5-26-27 = 3 This confirmed the history Manual removal of entire placenta 17 days post partum

In patients with absolute and permanent contra-indications to bearing children, we have in the last few years, induced abortion by means of *x*-ray exposure (14) At times it is important to be sure that the fetus is dead as the products may be retained a number of weeks after the death of the fetus, the entire products being then expelled without febrile reaction "en masse," resembling a "missed abortion"

No 1370, "Hyperthyroidism, *x*-ray Abortion Is the fetus dead?"
36 years, III para, basal metabolism +26
Last menstruation—2-27-27
Blood taken—4-23-27 = 4
x-ray given—4-26-27
Blood taken—5-4-27 = 3+
Blood taken—5-25-27 = 0
Showing that eight days after the treatment the pregnancy reaction still existed but that thirty days later death of fetus and detachment of the placenta had occurred.

No 1108 contrasts with the above
"Spinal Cord Tumor Recently Removed, Paraplegia, Pregnancy" Helpless, 4 months pregnant, *x*-ray abortion attempted though it was realized that with the extreme obesity and advanced gestation the attempt might prove futile
x-ray given—2-18-26
Blood taken—4-19-26 = 2½+
Diagnosis of continuation of pregnancy
This was confirmed when uterus was emptied per vaginam

4 Miscellaneous Diagnoses

A few more striking instances have been selected to show the usefulness of the reaction in general diagnosis We desire to emphasize that the laboratory findings are recorded solely by number without our knowledge of the clinical data For the final interpretation, however, blood readings, clinical data and physical examination may have to be co-related

THE TREATMENT OF MALIGNANT LESIONS OF THE EYELIDS*

By WILLIAM L. BENEDICT, M.D. and MARY KNIGHT-ASBURY, M.D.
ROCHESTER, MINN.
Section on Ophthalmology, The Mayo Clinic, Rochester, Minnesota

MALIGNANT lesions of the eyelids are usually situated along the margin of the lid or near the inner canthus. The growths may be primary and single or multiple, or they may be extensions of lesions originating in the skin of the side of the nose or the cheek. It is not uncommon to find that a lesion in the margin of the lid, and one or more of the face, develop at about the same time, they may be of the same or of different types but of epithelial origin. Multiple lesions are usually of low-grade malignancy, grow slowly and yield to treatment more satisfactorily than the solitary and usually more malignant lesions.

The skin of the lids, the conjunctiva, the cornea, and the lining membrane of the various glands of the lids are derived from epiblast. The malignant lesions of the lids are usually epitheliomas arising from the epiblast and may be divided into those starting in surface epithelium, or in glandular epithelium, or they may be congenitally sequestered epidermic masses, moles or nevi. On the margin of the lid and at the inner canthus the rodent ulcers appear first as nodules beneath the surface where they may remain for months or years with little change in size and without a tendency to break down. They may also begin as foul ulcers that progress slowly in all directions, showing a crusted surface which bleeds easily when the crust is removed. There is more inflammatory reaction associated with them than with squamous-cell epitheliomas and extensive fibrosis of the base may limit growth downward, and at the same time obstruct any natural or artificial efforts at cure.

Other types of epithelioma grow with greater or less rapidity and show various grades of malignancy. According to Broders, "Epithelioma graded 1 is one in which differentiation or self-control ranges from almost 100 to 75 per cent, and undifferentiation from almost nothing to 25 per cent, epithelioma graded 2 is one in which differentiation or self-control ranges from 75 to 50 per cent, and undifferentiation from 25 to 50 per cent, epithelioma graded 3 is one in which differentiation or self-control ranges from 50 to 25 per cent, and undifferentiation from 50 to 75 per cent, and epithelioma graded 4 is one in which differentiation or self-control ranges from 25 per cent to practically nothing, and undifferentiation from 75 to 100 per cent. Squamous-cell epithelioma control themselves by differentiating into keratin which in circumscribed masses are called pearly bodies, and into cells which, if they do not contain keratin, have differentiated beyond their ability to reproduce, such as the large flat squamous cells. Basal-cell epitheliomas control themselves by producing cells similar to the normal basal cells of the skin, and melano-epitheliomas by producing melanin, which is a product of the epithelial cells and indicates an attempt at self-control."

New and Benedict stated "Our experience with the use of radium in diseases of the eye has been confined to two groups of cases, first, those which are treated with radium alone, and second, those in which the radium is employed in addition to surgery. The malignant cases are selected on a basis of the character of growth, chronicity and extent of involvement of the tissues. The degree of malignancy will be determined by the type of cell most abundant, and by the site of and direction in which the tumor extends. Basal-cell epithelioma of the lids without involvement of the tarsus or bone may be entirely removed by radium treatment."

Since the publication of this statement we have employed radium in the treatment of small basal-cell tumors with uniform success. Many such tumors, however, have fibrous bases that offer resistance to radium and often the depth of penetration of the tumor cells cannot be estimated. The results of radium treatment in these cases are not so favorable. Ewing, in speaking of rodent ulcer, said "In advancing lesions, long slender strands of tumor cells may be traced for some distance through the lymphatics, and eventually connecting with what may appear to be multiple foci of origin. This histologic feature explains the persistent recurrence of these tumors after apparently thorough extirpation." In some of our cases cancer cells were found in the deeper tissues that were exposed during the course of plastic operation although the surface had healed and there was no external evidence of their existence. Recurrences after several months or years led to the employment of larger doses of radium in some cases and in others the lesion was removed with a margin of apparently healthy tissue and radium applied afterward. The uncertainty of destroying all the cancer cells by radium is an argument against the practice of covering the area from which an epithelioma has been excised with a flap of healthy skin and then irradiating it

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany, N. Y., May 23, 1928.

Feels she is pregnant
Blood taken—10-17-27 = 0
Blood taken—10-24-27 = 0
Blood taken—10-31-27 = 0
Diagnosis of Pseudocyesis
Reduced to 198 lbs with dieting and thyroid extract
Blood taken—1-9-28 = 2+
Menstruated—1-15-28

No 1644, "Pseudocyesis"
26 years, O para, regular q 30 days, treated as pregnant for five months by family physician, "feels life"
Last menstruation—8-31-27
Blood taken—4-2-28 = 0
Most difficult to convince patient of non-pregnant state

No 1381, "Ectopic Pregnancy?"
28 years, O para, 28 day cycle, missed one period, spotted, had cramps and then profuse vaginal bleeding, still bleeding
Last period—3-16-27
Blood taken—5-2-27 = 3
Diagnosis of pregnancy
Operative findings ruptured ectopic gestation

No 1402, "Does the Ovarian Cycle Persist after Hysterectomy?"
34 years, 21-28 day cycle, operated 4-4-27, hysterectomy, one ovary left in situ
Blood examined weekly between 5-25-27 and 7-12-27 with +3 on 6-7-27 and 2+ on 6-28-27, showing 21 day cycle

No 1651, "Normal or Abnormal Uterine Bleeding"
62 years, IV para, 28 day cycle but now less regular and more profuse Claims to have had 50 r-ray and one radium treatment outside of hospital Exercise and excitement produce bleeding
Blood taken—4-17-28 = 3
The bleeding is of ovarian origin in spite of age of patient and the various radiotherapeutic measures

No 1151, "Hypersecretion of Female Sex Hormone with Hemorrhage and Excessive Molimina"
34 years, II para, 21-28 day cycle, increasing bleeding and acute premenstrual nervous phenomena aproaching to mania
40 c c. blood taken 5-19-26 = 4
30 c c blood taken 9-28-26 = 3
20 c c blood taken 9-28-26 = 0
These last bloods taken 2 days before period showed a mouse unit to 30 c c instead of the regular amount, 40 c c
r-ray treatment given 10-15-26
30 c c blood taken 2 days before period, 12-4-26 = 0
Menses have remained scant No further symptoms of undue tension have developed in the last two years

Lack of time and space prevents the recording of additional illustrative cases No attempt will here be made to apply our method to the interpretation and evaluation of puberty and climacteric bleeding nor to prognosis in cases of sterility in which no obstructive obstacles (mechanical or chemical) exist It is true, however, that the reaction sheds much light upon many of these obscure and puzzling condition and enables us to prognosticate with greater certainty and to treat functional derangements especially, more rationally than heretofore

From the cases instanced above, it must be apparent that in obscure conditions the diagnosis, particularly of pregnancy, of death of fetus, or even the recognition of ectopic gestation may be facilitated by means of our test The seriousness and importance of a given case of amenorrhea is regularly illuminated by means of our test, enabling the physician to prognosticate, and therefore to plan out effective therapy if such is possible. Judging by the number of laboratories in different parts of this country and foreign countries which have taken up the test, we may soon expect reports from other sources giving additional data which we hope will confirm the value of the test

squamous-cell epithelioma, graded 3, one was a squamous-cell epithelioma, graded 2, one was a basal-cell epithelioma with associated enlarged cervical lymph nodes for two and a half years before operation In one case tumor cells were found later in tissue removed in the course of plastic repair, but there was no external evidence of recurrence If local cures are considered, the known recurrence in this group is reduced to six Excision of the lesion followed by radium was carried out in five cases that showed recurrence following the use of radium and roentgen ray and have remained well

Excision by knife or cautery was performed in twenty-nine cases without clinical recurrence as far as is known In one case basal cells were found in tissue removed in the course of plastic repair but there was no clinical evidence of its presence. Twenty-two of this group were basal-cell epitheliomas, three squamous-cell epitheliomas (one graded 2, one graded 3, and one graded 4), and four unclassified

Surgical diathermy was primarily used in twenty-five cases There were four known recurrences In two of these the lesions were extensive and treatment by radium and roentgen ray had been given In two, previous treatment had not been given In six cases diathermy was followed by deep roentgen-ray treatment, without recurrence, and in two diathermy was followed by radium, without recurrence In seven cases exenteration of the orbit was carried out because of extensive involvement. In four there has not been recurrence of the tumor In three cases radium was applied following exenteration Two of the growths were basal-cell epitheliomas and two were unclassified Two patients died of metastasis following exenteration One had a squamous-cell epithelioma, graded 3, and the other a squamous-cell epithelioma, graded 4 A questionable recurrence of squamous-cell epithelioma, graded 3, was reported by letter two months after operation, but could not be verified Roentgen rays alone were used in five cases, but in four of these the outcome is not known In one case recurrence had not occurred after eleven months

DIABETES MELLITUS IN CHILDREN*

By HENRY RAWLE GEYELIN, M D, and THOMAS T MACKIE, M D, NEW YORK, N Y

DIABETES MELLITUS occurring in children and adolescents presents a problem which differs in some important respects from that encountered in adults This depends upon an essential difference in severity, and upon the particular age group, in which both structural growth and physiological function are still in the formative stage

The importance of the hereditary factor is uncertain in diabetes developing in later life The conditions are even more obscure, however, with respect to the mode of origin and the frequency of familial juvenile cases In these younger individuals acute infections such as scarletina, typhoid fever, and epidemic parotitis are occasionally followed by severe and rapidly progressing diabetes In Norway a rise in the death rate from grave diabetes among the younger age groups has been shown to follow three or four years after successive epidemics of mumps

Fundamentally there are but two types, severe and mild An essentially mild case may show all the signs of severe disease for considerable periods of time, and yet, as the result of proper treatment, regain its original status and retain it until death from other causes Conversely, the intrinsically severe form may exhibit periods of comparative quiescence, but the original and fundamental quality never disappears permanently The so-called inherent progressive characteristic is significant of this latter type In it the onset is commonly acute, and, in the absence of Insulin, is followed by a progressive and rapid downward course with fatal outcome despite extreme dietary restriction This form is more common in children and young adults, and is more frequently complicated by acidosis than is the milder type of disease

The pre-insulin course in the majority of the juvenile diabetics may be described as follows Whether above or below normal weight at the time of onset, progressive loss of weight and strength occurs due to the restriction of the diet and to the loss of food resulting from the glycosuria It is exceptional to have growth in height continue at normal rates even in moderate diabetes, and it decreases or ceases altogether as the disease progresses The occurrence of considerable amounts of sugar in the urine with relatively little elevation of the blood sugar level is common As this is controlled, however, the symptoms disappear and ability to utilize food returns to a varying degree initiating a period of quiescence

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y May 23, 1928.

through the flap Cells may be buried and they may continue to grow unsuspected until a large deep-seated tumor has developed Although muscle is rarely invaded, bone is not a barrier to the progress of the disease and the tumor may slowly grow inward without external signs Radium is also regularly employed as a placebo in cases of inoperable carcinoma of the orbit Just conclusions with regard to the use of radium may not be reached if its action in all cases in which it is employed is included in a general consideration of the treatment of carcinoma The conditions under which it is used must be considered with regard to the dosage and probable depth of effective penetration The malignancy of the tumors must also be taken into account

Although there is very little difference in the malignancy of rodent ulcers, there is considerable difference in the malignancy of squamous-cell epitheliomas The more highly differentiated the cells the less are they affected by irradiation Epitheliomas of low-grade malignancy probably become more malignant by the use of small doses of radium, inefficient roentgen-ray treatment, and irritation with chemicals, such as hydrochloric and nitric acid, silver nitrate and arsenic paste Basal-cell epitheliomas may be changed to squamous-cell epitheliomas by continued irritation, or in rare cases without any known external irritation, and squamous-cell epitheliomas often take on more malignant characteristics with each successive recurrence after extirpation or irradiation It seems apparent, therefore, that all epitheliomas of the lids should be considered as potentially of high-grade malignancy and every effort should be made to remove them completely at the first treatment

Roentgen rays are effective in certain superficial tumors of low-grade malignancy, but this form of treatment has been inferior to radium in most cases of epithelioma of the lids and is now seldom employed alone It has been found that heat is a very effective agent in the destruction of epithelioma cells and we have used the actual cautery following excision of large malignant lesions, such as exenteration of the orbit, and the galvanocautery to remove smaller tumors Surgical diathermy has been used in a number of small lesions on the margin of the lid, with less deformity than would have resulted from excision, and the end-result has been satisfactory The contraction of the scar, which is smooth, tends to make the margin of the lid even, with but little loss of tissue in cases in which a rather large coloboma would have resulted from excision Immediate repair after excision is not regarded with favor, the deformity therefore may lead to disastrous results from lack of protection to the globe

We have found the most effective method of eradicating malignant lesions of the lids to be excision followed by radium, by surgical diathermy or by fulguration In many of the cases some form of ineffective irradiation or operation has been given previously In a few cases there is recurrence after an apparent cure of several months The type of treatment has varied with the introduction of new methods of treatment or with increased facilities for the use of older methods The fact that the pathologist has found proliferating epithelial cells deep in the tissues of apparently healed lesions has led us to make some changes in methods of treatment

From 1918 to 1927 inclusive 251 patients were treated for rodent ulcer or epithelioma of the lids by various methods Many of these patients did not return after the first treatment and there has not been an opportunity to learn of the result. Others have had carcinoma develop elsewhere in the body, or some other disease of a serious nature has developed It has been impossible to get reports from all Patients who have been treated more recently and believed to be cured may have recurrences later Others had lesions so far advanced as to preclude any reasonable expectancy of cure Of this group, however, there were 107 considered cured at the close of 1927 Many of the smaller tumors were removed by diathermy or radium without excision, and tissue was not taken for pathologic examination The classification of the tumors of those considered cured is as follows unclassified, forty-four, basal-cell epithelioma, forty-seven, basal-cell and squamous-cell epithelioma, graded 1, six, basal-cell and squamous-cell epithelioma, graded 2, one, squamous-cell epithelioma, graded 2, four, squamous-cell epithelioma, not graded, four, and squamous-cell epithelioma, graded 3, one

Ninety-eight of this group of 251 cases of epithelioma were treated by radium Most of the lesions were basal-cell epithelioma but several were mixed epithelioma, a few extensive inoperable epitheliomas are included There were twenty-seven known recurrences in this group, in twelve the lesion was advanced and the outlook hopeless at the first examination In five the lesion was not classified, three of these were basal-cell epitheliomas, two squamous-cell epitheliomas, graded 2, and two squamous-cell epitheliomas, graded 3 Exenteration of the orbit was performed later in four cases since the progress of the growth was not retarded by radium Of these four cases three were basal-cell epitheliomas and one was squamous-cell epithelioma, graded 2

Eighty-seven patients were treated by excision of the lesion followed by treatment with radium. There were eleven reported recurrences Two of the patients were cured by subsequent treatment, one of the growths was a basal-cell epithelioma and the other a squamous-cell epithelioma, graded 2 One questionable recurrence was reported by letter, a squamous-cell lesion, graded 2 In four cases local recurrence did not occur but metastasis developed Two of the recurrent growths were

tein equilibrium as shown by a positive nitrogen balance This was the era of high fat, low carborydrate diets

As this system was observed, undesirable effects came to light Not infrequently the continuous elevation of the blood fats and blood cholesterol above normal limits were found to be associated with a gradual reduction of the sugar tolerance These findings now are regarded not only as of prognostic importance, but as indications for alteration in the type of treatment prescribed The belief has grown, moreover, that these abnormalities in the blood may play a role in the incidence of vascular complications later in life Joslin has recently stated his belief that a diet containing at least one hundred grams of carbohydrate instituted soon after the onset of diabetes may prevent the development of premature arteriosclerosis

Supplementing these clinical observations, experimental work has demonstrated that diets high in acid-forming and low in base-forming ash, when fed to animals, diminish the effect of Insulin injections and increase the resistance to the development of hypoglycemia Similarly, the administration of a high fat and low carbohydrate ratio renders animals less susceptible to the effects of Insulin than those fed on normal diets

Acting on these indications, a change in the type of dietary prescribed was instituted several years ago in a series of diabetic children The fat content was reduced and the carbohydrate materially increased It was soon found that this previously radical procedure was associated with surprisingly little increase in the Insulin requirements immediately after the change, and in many cases there followed not only a decreasing demand for Insulin, but a definite, and apparently permanent, increase in the carbohydrate tolerance

More recently these findings have been confirmed by Sansum who, for a period of nearly three years, has been using diets containing not less than two parts of carbohydrate for each part of fat. He found no reduction of tolerance which could be directly attributed to the diet, and further a more rapid rate of improvement than any previous regime had afforded Ladd, investigating the relation of food intake to the best growth in the series of diabetic children at the Presbyterian Hospital, found that this objective was attained by a diet containing the requisite number of calories, protein in amounts sufficient to ensure a positive nitrogen balance, and a ratio of three to four grams of carbohydrate for each gram of fat

The second essential of adequate treatment, the maintenance of a sugar-free urine and a blood sugar level within normal limits, requires the use of Insulin Reviewing the results in the treatment of ninety-five diabetic children in the Toronto Hospital for Sick Children, Boyd found that only fifteen per cent were able to take an adequate diet without Insulin and in none of these did the initial tolerance exceed 100 grams of carbohydrate daily Three-fourths of the remaining eighty-five per cent could not be kept sugar-free on their basal diets alone

In the normal human every supply of carbohydrate seems to induce an excessive liberation of Insulin It has been shown that the urine of healthy individuals taking a carbohydrate-rich diet contains from 25 to 60 clinical units In diabetics, however, this response fails and the excretion diminishes pari passu with the severity of the case

Combined studies of the blood and of the respiratory quotient indicate that in mild diabetes immediate oxidation of glucose may be responsible for the lowering of the blood sugar In the more severe cases, however, associated with a low respiratory quotient in the fasting state and an inability to store glucose, the initial effect of Insulin is to enable storage of carbohydrate or its conversion into glycogen Definite evidence of increased oxidation appears later Its action seems to be intimately linked up with the water metabolism Joslin and others have observed that dessication of the tissues is an important factor in rendering diabetic children especially prone to dangerous reactions and experimental work on dogs has shown that the type of reaction is greatly influenced by the water reserve of the organism

The problem of Insulin administration is frequently more difficult than encountered in an adult Children as a group react more rapidly and more profoundly In mild cases when the diet is so arranged that the greater portion of the carbohydrate allowance is given at the morning and evening meals two doses a day given one-half to three-quarters of an hour before breakfast and supper respectively may be sufficient to cope with the overload of the pancreas In the more severe cases, however, three injections a day may be required, and in maximally severe diabetes one at midnight as well may be necessary to prevent the spilling of sugar during the latter part of the night.

The size of the individual dose necessarily must depend upon the amount of sugar excreted, the time at which this occurs, and the distribution of the carbohydrate between the three meals During the stage of adjustment this implies the collection of the entire twenty-four hour urine output and the quantitative determination of the contained glucose A convenient method is that of collecting sep-

which permits increase of the diet, often to a normal level Growth in height may continue and some or all of the weight lost may be regained This phase of marked improvement, or apparent arrest, continues for a variable length of time, seldom, however, persisting more than a few months before the glycosuria recurs The return of active symptoms is due to inevitable loss of tolerance, and is always hastened and aggravated by excessive food intake

More by implication than by direct evidence, a diffuse disturbance of the endocrine system is suggested in which the alteration of pancreatic function is but one, although inevitably, the most striking feature Formerly diabetes was considered purely as a disturbance of the ability to store and to utilize carbohydrate As knowledge increased this view has been amplified to the concept which is held today that the disease, fundamentally, is based upon a widespread disturbance in the body metabolic processes There results not only a diminished capacity to burn glucose and to transform it into glycogen, but an intolerance for caloric intake above a definite level irrespective of the form in which the energy is supplied Accompanying this is a disturbed metabolism of fats which is most obvious, of course, in acidosis, but which is present even in the absence of this complication The lipemia and the elevated level of blood cholesterol in uncontrolled cases, the incidence of marked arteriosclerosis, and the development of Xanthoma diabeticum, all of which are not infrequently encountered in adult diabetics, indicate the results of this deficiency

While excess weight for height, excess height alone, or both, are said by some to be present at the time of onset of the disease, others, using different standards, have not found these phenomena of frequent occurrence Ossification in advance of the chronological age is often encountered in children with diabetes of recent onset, but it is delayed in those whose disease is of long standing Bone atrophy occurs in some cases before the ninth year, but has not been demonstrated after that age In the psychic field there are no criteria of sufficient accuracy to judge minor variations in development Although these are suggested by the lack of concentration and the flagging of interest found in certain children during the active acute stage before adequate treatment has been begun, they are probably to be regarded as the expression of undernutrition and increased fatiguability rather than evidence of a deep-seated retardation of intelligence

Prior to the discovery of Insulin, attention was focused upon the effort, frequently unavailing, to maintain life In recent years this goal has been achieved The ideal to be striven for in the modern treatment comprises not only the termination of glycosuria and the maintenance of a normal blood sugar level, but a diet sufficient to permit and to stimulate normal growth and development, and to supply the requisite calories for average physical activity

Manifestly, before the use of Insulin, these objectives could be attained in part only The continuous undernutrition and periods of starvation resulted in marked stunting of growth The retarded menstruation in adolescent girls, and the infrequency of pregnancy in women are the functional expressions of the same factors While we now have the means and the knowledge to supply food in adequate amounts, meanwhile controlling the disease, the problem with children resolves itself into two questions of prime importance What should be the allowance of total calories per day in a given case and in what type of diet should they be prescribed?

These fundamental questions imply a knowledge of the particular requirements of children, and how these may be met without producing a state of overnutrition which may jeopardize the individual's tolerance or expose him to an undue danger from accidents Yet growth in height and increase in body weight must be accepted as of equal importance with the maintenance of a sugar free urine and a normal level of blood sugar

Strangely enough, however, there are no completely satisfactory standards of height and weight for age In a detailed study of bodily development, Ladd concluded that the optimum weight for the diabetic child is probably the normal, average weight for height as given in Bardeen's tables, plus or minus 12 per cent The use of the height-weight-index growth curves permits, in addition, not only comparison with the standard at any age, but also affords valuable information about the rate of growth, as shown by the tendency of the curve to deviate from, approach, or remain parallel with the normal

While tables of the caloric and protein requirements at different ages for normal children are available, it is not certain that these figures are ideal or even essential for the diabetic Those of Holt and Fales are probably the most satisfactory The optimum ration for the diabetic, however, appears to be somewhat lower than their figures, averaging about two-thirds the amounts recommended

Before the modern philosophy reached its present development we considered largely or only the limitations of the individual in the metabolism of carbohydrate, and the necessary restrictions of the caloric intake At this period the dietary was planned to supply energy largely in the form of fat Necessarily the ketogenic ratio demanded respect, and equally important was the maintenance of pro-

PUBLIC HEALTH WORK BY COUNTY MEDICAL SOCIETIES*

By GUY H. TURRELL, SMITHTOWN BRANCH, N Y

A QUARTER of a century ago Ellen Key described the present century as the century of the child Since then the era has been called by numerous writers the age of public health. Probably both of these generalizations are about equally true. They both refer to different aspects of a mental attitude characteristic of modern thought. This attitude has expressed itself in the various altruistic movements of our time, not the least important of which are the desires for race improvement and health betterment

While the public health movement had its origin in the modern altruistic outlook, it has rapidly become distinctly egoistic in its application. The people want better health not only for their neighbors, but for themselves and for their children The movement has of course followed the spread of popular knowledge about recently discovered facts as to the causation of disease The spread of this knowledge has been due to two main causes to publication in the daily press and magazines and to the efforts of numerous welfare organizations and lay health workers The thirst of the people for health knowledge stimulates more publication on health subjects in the daily press and the entry of more lay workers into the field of preventive medicine These in turn increase the demand by the people for health betterment. The circle of cause and effect is complete

Such is the situation, then, as the doctor sees it There is an ever growing demand by the laity for a knowledge of disease prevention and the prolongation of life, and a consequent effort to supply the demands by an ever increasing number of lay health enthusiasts What can the doctor, as represented by the county medical society, do in this situation? At first glance it might almost seem that the medical society did not need to do anything—that health knowledge is being supplied and disease prevention accomplished without the aid of organized medicine But a very little study convinces one that medical supervision is essential to secure the best results both in the spread of health knowledge and in its practical application in disease prevention

Scientific truth is constantly growing What yesterday was accepted as truth, today may be only exploded theory In the rapid progress of medical science, the lay health worker is always a lap behind in his teaching It is difficult enough for the highly trained medical man to keep abreast of the new things in science and to apply them in his work It is impossible for the partially trained lay worker For example, we find most lay nutritionists still teaching the paramount importance of milk in the diet of all growing children, whereas the pediatrist tells us that an excess of milk or other liquid food after the child begins to stand erect, predisposes to pot belly and a weak hollow back Similarly the fetish of a standard weight, to which every individual of a given age, height and sex must conform, is liable to do harm if too devoutly worshipped Nothing in medicine can be done by rule, invariably and as a routine Yet this is what the nurse so often does when she finds a child five or six pounds underweight and prescribes a quart or more of milk a day Such a nurse is practicing medicine, and is doing it without a license The county medical societies would be doing a very important service if they would take a decided stand against lay health workers prescribing any form of treatment In the long run this would protect the lay worker, for it would often obviate the necessity for the doctor to tell the patient that the treatment given was inappropriate

The foregoing is not said in any spirit of unfriendly criticism of the lay health workers I have the greatest admiration for them and sympathy with their ideals and their enthusiasms

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 22, 1928.

arately the night urine from supper to breakfast, that voided between breakfast and lunch, and that from lunch to supper, with separate analyses

Complications—Not infrequently reference is found in the literature to cases which are refractory to Insulin, in that the blood sugar fails to respond and glycosuria continues Although it is doubtful if a condition of true Insulin resistance occurs, aside from that encountered in severe cases of acidosis, it is not uncommon to see a patient who has been progressing smoothly, begin to show traces of sugar in the urine and despite this have occasional or daily hypoglycemic reactions On questioning one usually finds that the injections have been given in a narrowly restricted area and that the subcutaneous tissues are thickened and indurated to an extent which induces irregular, delayed, and insufficient absorption The utilization of other regions is accompanied by prompt readjustment It is important, therefore, to ensure constant shifting of the sites of injection

Hypoglycemia—The symptoms resulting from overdosage appear, as a rule, within a comparatively short time When the onset is sudden and follows rapidly upon the injection they are usually severe with profound weakness, sweating, acceleration of the pulse, mental confusion, and finally unconsciousness, associated with muscular twitching, progressing to generalized epileptiform convulsions and an extreme lowering of body temperature The less intense and more common form, however, does not pass beyond the stage of weakness diaphorosis, pallor or flushing of the face, and tremor

Occasionally a clinical picture is encountered which, properly, may be spoken of as chronic hypoglycemia This condition is well illustrated by a boy of 15 years of age, who suddenly developed a marked personality change After a week of inattention and unusual lack of interest at school he took part in a game of basketball, and after supper, while out with some of his friends, he suddenly lost consciousness At that time he presented a characteristic picture of Insulin shock and recovered promptly after the intravenous injection of glucose He had no recollection of anything that had occurred that day after leaving for school in the morning Rearrangement of the Insulin dosage eliminated further difficulty

When hypoglycemia has progressed to the point where the individual is uncooperative, semi-conscious, and unable to swallow, the administration of four to eight minims of adrenalin by hypodermic will often produce a temporary alleviation sufficient to permit the ingestion of the required sugar In severe cases, however, it is necessary to give it by vein

Acidosis—Acidosis is by far the most important complication and the most fatal The omission of Insulin, perhaps only for a day, or the onset of an acute infection, especially if it is associated with vomiting, may lead rapidly to a serious or desperate situation One of the few didactic statements which may be made in medicine properly enters here, under no circumstances should the juvenile diabetic fail to receive at least a portion of the usual daily carbohydrate and a corresponding amount of Insulin Even very mild cases at times develop a rapid and serious acidosis when deprived of these essentials

Prognosis—The ultimate prognosis of the diabetic child who is ideally treated from the outset remains a moot point. It is still too early in the study of the natural history of the disease under Insulin control to determine to what extent growth, rest of the functionally exhausted island cells of the pancreas, and regeneration of acinar tissue, may alter the course of the diabetes in later life However, it is probably safe to say that the ultimate severity will be diminished While there are rare reports in the literature of complete cure, or arrest, of the disease which seem authentic, it is probable that in almost all instances benign glycosuria, or the characteristic but temporary restoration of tolerance in the early stage have led to erroneous conclusions However, with an adequate diet and proper amounts of Insulin, the diabetic child may look forward to a relatively normal life

Conclusions

1 Diabetes in childhood presents a more difficult problem than that encountered in adults because of the greater severity of the disease and because of the necessity for providing a diet sufficient for adequate growth and development

2 The lack of completely satisfactory standards of height and weight for age, and the lack of knowledge as to what constitutes the ideal caloric intake at the various ages makes treatment more uncertain than it should be The Bardeen tables appear to be the most satisfactory in meeting the first requirement, and the Holt Fales standards as modified by Ladd the second

3 The use of a diet containing sufficient protein to maintain a positive nitrogen balance, and three to four grams of carbohydrate for each gram of fat improves the tolerance, does not increase and at times even reduces the Insulin requirements, and is associated with the most normal rate of growth

Medical Education will be glad to give assistance along any of these lines

Of about equal importance with graduate education is the promotion of the annual physical examination of the apparently well For some strange reason the average doctor fails to urge the desirability of this procedure upon his clientele I suspect it is because he does not wish to appear to hunt for patients but wishes them to seek him out He fears the charge of commercialism Perhaps the too sensitive skins of our brethren might be protected by a printed card hung in the waiting room containing some such paraphrase of the motto of the State Department of Health as the following

"Health and longevity are purchaseable An annual physical examination may disclose a beginning weakness, the overcoming of which will lengthen the span of life"

I would suggest that the editor of our JOURNAL invite the submission of slogans or mottoes of this sort for publication from time to time, and the best be selected and printed on a suitable card and sent to each member for display in his office Such a mute half-appeal would at least be a fulfilment of our obligation to our patients Another way of attacking this problem is for the county society to secure the examination blanks from the American Medical Association and have the members examine each other Judicious and widespread publication of this impresses the laity with the belief that the doctors believe in their own medicine and practice what they preach

These are some of the things that every county society should do There are many others that will be more appropriate in certain counties On Long Island we are having special problems in the shell fish industry, water supply and sewage disposal Other counties will have different problems that are more pressing For example, the entry of tularemia into our state may make desirable laws against the importation by game associations of live rabbits until they have been quarantined and proven free from this disease The county societies could most appropriately take the lead in a campaign to have such laws enacted

I have purposely omitted the question of county health departments, because there may conceivably be some difference of opinion as to their desirability in certain sections The Suffolk County Medical Society, after careful study, has become convinced that such problems as have just been mentioned together with the milk supply can be best dealt with by a larger unit than those of the towns and villages It has recently laid the matter formally before the Board of Supervisors and advocated the establishment of a County Board of Health No opposition has thus far developed and it is confidently expected that such a board will begin to function as soon as the new appropriations are available

In conclusion, I would say to the county societies, "Assume the leadership in public health and civic medicine" To do so is your right by reason of training and experience It is a right accorded you by custom and common consent. It is expected of you, and only when you fail in your duty to lead, do lay organizations step in and take the reins

DISCUSSION

Dr Young I would like to know the exact method used by the Suffolk County doctors in advising and directing the lay health organizations

Dr Turrell The method which is used in Suffolk County is that of the cooperation of the County Medical Society in the work of all the lay health organizations It was not very long before the lay leaders turned to the doctors for information on technical points, and the next step was to make doctors themselves the leaders and executives in the organizations This has happened in the Suffolk County Tuberculosis and Public Health Association

Dr MacElroy How can the doctors finance their public health works?

Dr Turrell The doctors of Suffolk County have found that they need to expend only a small amount of money except in the publication of the Monthly News Letter of the County Society This publication was originally started by the doctors for their own information, but it was gradually sent to an increasing number of other persons who asked for it, until finally the Tuberculosis and Public Health Association arranged to purchase 1,000 copies of each issue to send to a selected list of laymen who are interested in public health work But the News Letter is issued and controlled entirely by the Medical Society Local dues of five dollars per member are sufficient to carry on all the work of the County Society

They are all enthusiasts or are directed by enthusiasts Enthusiasm is an admirable and highly desirable trait in anyone, and it is almost indispensable to successful teaching But it is characterized by a dominance of the emotional over the reasoning factors involved in any action The enthusiasm of the lay worker therefore, unchecked by the sober judgment of the doctor, based on broader training and experience, is very apt to go to extremes This is one of the reasons why, in the past, the lay health workers have tended to pauperize the less sturdily independent members of a community Seeing only the desirability of perfect health, they frequently overlook the moral and economic factors involved in all social problems With these thoughts in mind, one is not so astonished at the constantly increasing number of modern mothers who are over concerned about the bodily health of their children, while apparently entirely oblivious of their moral and spiritual needs

In order to have their proper influence upon the solution of public health problems, the doctors as represented by the county societies must assume the leadership in civic medicine They cannot influence the march of events by merely hanging on to the tail board of the band wagon Not every doctor can specialize in public health But just as the profession of a district recognizes the leadership of certain men in general surgery, others in eye, ear and throat diseases and the other specialties, so the members of the county societies should recognize the leadership of those in their society who are experts in preventive medicine They should give them a place in their programs, listen to their advice, adopt their suggestions in whole or in part, and back them up in the carrying out of the plans If we adopt the simile of Dr Frank Overton that the process of supplying public health is like a great manufacturing business, with the physicians as the producers, the boards of health as the advisory technicians and scientists, and the lay organizations and workers as the salesmen, the stock holders as organized in the county medical society must select the board of directors and executive officers of the business from the best qualified men available and be guided by their judgment and endorse their actions at the annual meetings In the county from which I come, we are fortunate in having two outstanding leaders in civic medicine and the rest of us have supported them to the limit In consequence "there is not a single organized lay health effort in the county that is not dominated both in program and administration by medical men, and none not directed by the County Medical Society"

If other counties will do likewise there will be no need for me to consider in detail what a county medical society can do for public health However I must inflict upon you a brief presentation of some of the most important public health activities in which a county society can engage, partly because that is the subject assigned me and partly because there are left a few more minutes of the allotted time for this paper

One of the activities of preventive medicine most productive of good results is the anti-tuberculosis work Unfortunately all too many doctors are not interested in treating tuberculosis It is true that pills and tablets have little influence on the disease, but I know of nothing more gratifying than to see a tired and overworked tubercular mother gradually return to health and strength under proper hygienic management. Aside from the general effect of the interest of the doctor, the leadership of the county society in this preventive work produces earlier diagnosis of those who are actually sick and also discovers the incipient and symptomless cases among the contacts Just as in any other communicable disease, a complete epidemiological study involves the discovery of the source of infection and an investigation as to possible secondary cases in the family or among other contacts Concretely, the county medical society should see that places are secured on the boards of directors of the Tuberculosis and Public Health Associations and the Tuberculosis Sanatoriums for doctors with personality and influence If the right men are found, the good results in the reduction of the death rate will be unfailing

The next activity to which I would invite your interest has to do with hospitals If there are no hospitals in the county, a survey of the county by a committee and a wide publication of its report showing the need will often produce surprising results If the number of hospital beds in the county is adequate for the population, a survey of the hospitals by the committee with a comparison of equipments, laboratory facilities, completeness and accessibility of records, staff-meetings, etc., after the general plan of the American College of Surgeons, cannot help but stimulate each hospital to improve the particular feature in which it may be behind another

It is the unquestionable duty of every doctor to keep himself informed of the new things in medicine This is often a very difficult thing for a busy practitioner, especially if he lives in a rural district removed from the larger centres where he might meet and discuss his problems with his confreres To meet this need every county society should each year institute some form of graduate medical education The method will vary with the situation in each county The most practical is probably a course or courses of lectures in various branches by experienced teachers as outlined in the report of the Committee on Public Health and Medical Education In exceptional cases it may be possible to have intensive courses of a week or more at some medical centre as has been done in Brooklyn for a number of years In other cases it may be desirable to combine the graduate education with the hospital staff meetings The chairman of the committee on Public Health and

SURVEYS OF A PROFESSION

Personality, or the expression of one's self, is based on the three fundamental elements of morals, intellect, and physical conditions

The first conscious idea implanted in the mind of an infant is obedience—a moral quality, and next comes the general concept of good and bad A comprehension of right and wrong begins while the child is only a year or two old, and soon becomes the dominant idea that controls his conscious acts It develops to almost its full power while the child is yet of tender age, and remains throughout life as a fundamental characteristic of the individual

The first conscious expression of sustained intellectual qualities come when a child is three or four years old, for that is the age when it comprehends the directions of a parent or teacher, and applies its mind to the solution of a problem such as searching through a picture book to find a particular illustration Intellectual capacity increases for a decade or two, but as a matter of fact, after the age of the middle teens the mind grows in content rather than capacity The ability to carry on sustained reasoning, consciously directed, is the peculiar characteristic of an intelligent human being throughout life

Conscious care for one's physical condition comes much later than moral or intellectual efforts A child obeys the dictates of its instincts such as hunger and fatigue, but he is usually well along towards his teens before he gives much conscious thought to the care of his body Even when he reaches the higher grades of the secondary schools and can reason along the lines of mathematics and history, the strong appeal for the care of his body is not health, but is strength and beauty as expressed in popular heroes of aviation and the ballfield Universities which lead in courses of physical instruction promote hygienic text books in which the appeal is to pride and the imitation of athletic prowess of physical beauty and grace The direct appeal to health and efficiency is never of compelling influence like that of right and wrong Few persons, young or old, give the conscious attention to bodily health that they do to their morals or their intellect Among the three sides of his nature, the moral, the mental, and the physical, a person gives the least thought to the physical,—until he loses his health, and then he makes frantic efforts to regain it

Man's three natures are served by three great organizations,—his morals by the church, his intellect by school, and his physical nature by the medical profession The minister of the gospel, the school-teacher, and the physician each must do his part in the making of a perfect man

The church, as it exists in New York State, has a noble history extending back through two thousand years of influence over the moral conduct of the people The best minds on earth have devoted their lives to the promotion of moral perfection among men and women, and yet only now and then does the church produce the saintly character of which martyrs or missionaries are made But the church still has a deep and lasting influence on morals and character, and the need of its influence today is greater than ever before

The school also has an ancient history Its needs and power have always been recognized, and today they are considered so fundamental that the law requires every child to attend school regularly Yet with all the efforts of teachers, few persons attain to mental superiority The work of the teacher is never ended, nor do grown men pass beyond the need of further mental training

The modern profession of medicine is scarcely a century old, and there has not yet been time to develop practical standards by which to judge the effects of the practice of medicine The church holds up the ideal that every man is a possible saint, and the newspapers are full of advertisements offering to teach every man how to make efficient use of the nine-tenths of his brain which is now dormant, but men generally do not blame the church or its ministers, and the schools and their teachers for the comparatively low standards of morals and intelligence shown by average persons People do not expect ministers to make people good, or teachers to make them intelligent, for goodness and intelligence come by individual effort

The limitations of the response of the people to ministers and school-teachers have been determined after centuries of effort put forth along every conceivable line and by all the power of governments The modern practice of medicine does not extend back further than a lifetime, and in its preventive forms it has existed scarcely a decade, and yet the medical profession is expected to approach its ideals far more closely than the church and the school have done after centuries of effort Physicians are subjected to questionnaires, investigations, and surveys in which ideal standards are used as measurements, with the result of yielding low marks for efficiency The medical standard used in the survey is that the facilities of scientific medicine of the very highest type shall be available to every citizen, in abundant measure, at all times Suppose a questionnaire similar to the one submitted to the doctors of Steuben County printed on

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5088

The Medical Society of the State of New York is not responsible for views or statements, outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

Editor in Chief—ORRIN SAGE WIGHTMAN M D, New York

Next Annual Meeting in Utica, June 3-6, 1929

For list of officers of County Medical Societies, see the issue of May 15, advertising page xxxvi.

THE MEDICAL NEW YEAR

This issue of the JOURNAL will reach the members of the Medical Society of the State of New York while the annual meeting is in progress and plans are being laid for the coming year While the names of the officers will change, yet it is an auspicious peculiarity of the Medical Society of the State of New York that office-holding is an introduction of the member to broader fields of usefulness It is an inoculation with the spirit of service, and an initiation into the mysteries of the practice of medicine by medical societies The strength of the Medical Society of the State of New York lies in its past officers, who are willing and anxious to continue the work which they began in their terms of service and carry it to full fruition

MEDICAL PROGRESS

The Etiology of Influenza—Professor M Neisser gives a series of 20 postulates on our knowledge of the etiology of influenza which are chiefly negative—that is, few or none of the possible causal elements can be upheld as universal causal factors He, like most Germans, still clings to the belief that the Pfeiffer bacillus is a true causal factor and not a mere complicator, and calls attention to positive sero-diagnoses and successful vaccination as reported by a small number of investigators During latent periods this organism lurks in a virulent state in the cavities of tuberculosis and in bronchiectases It is not impossible that large epidemics and pandemics can originate from these foci The disease may or may not be communicable from person to person, but from its mode of diffusion along travel and trade routes it evidently is contagious in pandemics and possibly under other circumstances, but the author does not believe in the occurence of waves of contagion Instead we have first small single foci which spread slowly until the rapid multiplication gives the illusion of a single large wave We may visualize this spread by comparison with a plague of vermin, where the always present foci, under certain conditions as warfare, become generalized into a mass manifestation But the author does not claim that Pfeiffer's bacillus is the sole cause of influenza, other organisms, as *B pneumosintes*, may be accused He is silent on epidemics attributed to pneumococci and other familiar pathogens. The weather conditions he believes to exert an influence which is not a mere coincidence The contagious theory seems weakened by the numerous failures to communicate the disease by experiment, even when the organisms should be virulent At present most pathologists believe that the disease, especially in its deadly form, is due to a symbiosis of two or more organisms, which have not been satisfactorily isolated—*Deutsche medizinische Wochenschrift*, March 1, 1929

Nephrectomy for the Pyonephrosis of Nurslings—H Widenhorn refers to the accumulated literature of pyonephrosis and suppurations of the urinary tract in general due chiefly to the recent developments of endoscopy in the very young In former times the diagnosis was often limited to cystitis, while now we have an entire series of pathological suppurative conditions It is true, however, that autopsy often showed the true seat of the mischief, although this could be regarded as due to an ascending infection The case quoted was in a female nursling 8 months of age with a pyuria which did not respond to disinfectants or to an autovaccine The patient being referred to the surgical clinic, the cystoscope showed the pus to come from the right kidney while palpation revealed the latter to be large and tender A diagnosis of pyonephrosis led to nephrectomy with prompt recovery A pyelitis had evidently resulted in a dilatation of the kidney pelvis and compression and infection of the kidney The diagnosis of these cases is relatively simple as palpation, a renal insufficiency color test, and cystoscopy give harmonious finds In regard to surgical relief the pediatrist has been educated to believe that the nursling cannot lose blood, for even the slightest loss may be prejudicial The experience in the surgical clinic serves to outweigh this view, for the author has found that from 1900 to date five successful interventions are on record, including the present one No failures are mentioned, although in operations to save life some mortality should be evident Children above the nursling age are not mentioned In regard to diagnosis, ureteral catheterization and pyelography do not seem necessary Female children can readily be cystoscoped after the age of 5 months, but in the case of boys some urologists make the limit 3 years Of the five cases mentioned two were in male nurslings aged 6 and 7 months In the others the sex was female—*Klinische Wochenschrift*, March 5 1929

Thrombosis and the Endothelial Reaction—It has become a fixed belief that thrombosis does not take place in the presence of healthy endothelium as Professor A Dietrich reminds us There must be loss of this, a roughening or other change, to favor the deposit of blood platelets, leucocytes, fibrin, etc But in spontaneous thrombosis, so called, it is impossible to demonstrate any alteration and we have to invoke secondary factors, such as slowing of the blood stream and stasis The cumulation of the results of experiment and the possibility of enzyme action of unknown nature leads us to the dictum that thrombosis in general results from some disturbance of the equilibrium between endothelium and the circulating blood, for the view that some alteration in the endothelium is the dominant factor is much too narrow From analogy there should be always a readiness for thrombi to form, a sort of positive phase, even if the act itself is not forthcoming If often happens that when in theory thrombosis should occur it is very rare.

page 703, should be sent to the ministers and school-teachers of Steuben County It would read somewhat as follows

How many parents have you instructed in the moral and intellectual care of their infants?

How many parents bring their babies to you regularly for examination and advice?

How many bring their children of from three to five years of age?

How many children have you immunized against immoral influences?

The ministers and school teachers would probably reply that they are unable to answer these details, for they can go only as far as the people will permit them to go A minister is always ready to give advice to those who seek him, but he cannot force his services upon anyone The school teacher puts forth every effort to teach the children who come to school, but he cannot compel the pupils to learn or the parents to encourage the children to get an education In a similar way the doctor may reply that he gives his best efforts to those who seek his services, but that the responsibility for health rests upon the people to respond to the doctor, as well as upon the doctor to appeal to the people

Man's three natures, moral, intellectual, and physical, are mutually interdependent, and efficiency in any one promotes the efficiency of the other two People will respond to the doctor's suggestions in direct proportion to their intelligence and moral conscience There is a great physical element in spirituality, and on the other hand moral conscience and intelligence will lead to the upbuilding of the physical body as the temple of the soul The medical profession is coordinate with the church and the school, and the physician will rate as high as the minister and the teacher when the three are judged by the same standards

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Continuing the Journal—Twenty-five years ago when the amalgamation of the two State Societies was being considered, the continuance of the Journal of the Association was discussed Physicians of to-day will be interested to see how fully have been the realization of the aspirations and expectations set forth in the following editorial in this JOURNAL of June, 1904

"The question as to whether or not the present publications of the Association should be continued by the amalgamated society after January 1st is at present a frequent topic of conversation in medical circles

"Those favoring the continuance urge the necessity of a journal as a medium of intercommunication between the officers and members, otherwise unobtainable, and call attention to the stimulating effect that the regular publication of their work in their own journal has upon the component county associations, to the benefit which might be derived in time to out-of-town members from the establishing of a circulating library, based on the books received for review, to the necessity of the control by medical organizations of medical advertising columns, and that in common fairness, as the work of the profession is the foundation of medical journalism, the profit derived from such sources should be used for the benefit of the members of the profession.

"Those objecting to the continuance of these publications, put forward the argument to the extra labor and expense involved in editing and publishing them But these objections seem to have little or no weight, when carefully considered

"The experience of those in charge of the publications of the Association, during the past few years, serves to show that with the enlarged membership of the amalgamated society, and the resulting increase in the circulation of the publications, that the income derived from the sale to non-members and from legitimate advertising would prove not only sufficient to cover the expense involved in the work, but would soon become a source of decided revenue of the Society The value of an organization to its members must ultimately be judged by what it does for them, for has it not been written, 'that by their works ye shall know them'?"

tempt to avert aspiration pneumonia failed The third patient was operated on during the war, but control was impossible and she disappeared from view The authors quote an opinion to the effect that the rapid loss of weight in these patients is one part of a vicious circle and an indication for establishing a fistula It is possible that the same resource may prove of value in myasthenia gravis —*Deutsche medizinische Wochenschrift,* February 15, 1929

Immediate Enucleation for the Treatment of Quinsy—After having performed more than 7,000 tonsillectomies by various methods, since 1915, R. A R Wallace still considers that for speed and sureness finger dissection cannot be excelled While watching the course of cases of quinsy, he has been convinced that the disease is in reality a septic cellulitis, which results in abscess formation only when Nature is winning the battle It is an attempt to get rid of an infected foreign body, and we should remove it to hasten cure and prevent future invalidism Acting on this presumption, Wallace has performed over 120 of these operations, and has regretted none. He has extended the operation, and now often removes the opposite tonsil and the post-nasal adenoid tissue as well, but only when sepsis is being successfully combated Usually it is not possible to operate until the third, fourth, or fifth day of the disease Before the operation heat should be used in every form to aid the defensive forces of the system In order to hasten the period of epithelialization, much of the anterior pillar may be left. The formation of pus, or, if pus is not formed, the accumulation of cellular jelly makes dissection easier The anesthetic employed is ethyl chloride sprayed slowly onto a Skinner mask well wrapped in Turkish towelling, or, for longer work, atropine and choloroform If secondary hemorhage, threatens, the Collins pile forceps pushed well home over the spot, clamped and jerked away, causes elastic recoil and intravascular clotting in the coiled up arteries This method never fails in the hemorrhage which sometimes follows the use of a too sharp guillotine In bleeders hemoplastic serum can be injected either before (if one has warning) or afterward when one is caught unaware, actually under the tonsil bed, beginning above the palate and traveling down in the edema caused by the serum This method stops oozing practically instantly —*British Medical Journal,* February 16, 1929, i 3554

Precordial Thoracectomy in Enlargement of the Heart.—R Giroux states that but 15 cases of this intervention are on record, with results not at all encouraging In the case reported the patient was a boy of 18, in the service of Vaquez, with a history of rheumatic endocarditis followed by hypertrophy There was especially insufficiency of the right heart with orthopnea The röntgen exploration showed dilatation of the entire heart and the liver was much enlarged Treatment consisted of ouabaine and digitalis alternated, but the improvement obtained was short-lived Thoracectomy was carried out by dividing the 3d-6th costal cartilages, and resecting the cartilages and some of the corresponding bony ribs The window formed in the thorax was 10 cm by 12 cm The symptoms of cardiac stasis soon subsided although radioscopy four months later showed that the heart shadow was but little smaller than before The great improvement in the function of the heart has persisted for a year or more Tuffier's patient similarly operated on survived 17 years but the author does not cite any other observations These two cases, however, show what can be done with the right selection of cases So far as can be said at present we should think of this intervention whenever digitalis and strophanthus give no relief In operating we wish the thoracic wall to stay supple and hence must not try to resect within the periosteum, for regeneration should be avoided In regard to the functional benefit in the presence of a persistent large shadow, this is probably in part due to unburdening the liver Certainly the pain, dyspnea, palpitation, oliguria, etc, are promptly and permanently relieved, although a crisis of dyspnea in this patient, due probbaly to accidental pneumothorax, must be mentioned In selecting cases for this intervention we must never operate if there is any active infection of the endo- or myocardium —*Le Bulletin medical,* February 20-23, 1929

Paroxysmal Slow Pulse with Syncopal Attacks Without Disturbance of Conduction in His's Bundle—E Géraudel sums up this case as follows Slowing of the pulse and the results of cerebral ischemia may be seen in the absence of all auriculo-ventricular blocking The sinus arrhythmia liberates ventricular automatism just as does a break in the conduction of His's bundle The results of examination of the pulse and of auscultation show an irregularity of rhythm of the ventricle which should rouse suspicions as to the legitimacy of the diagnosis of Stokes-Adams syndrome, and electrocardiography will then confirm or refute this possibility Here we may see in association supernumerary ventricular systoles and automatic systoles, which coincidence proves that there is no interference in the functioning of the ventriculonector In such a case there will be no retrograde auricular contractions, and this negative evidence speaks in favor of some difficulty of conduction The ventricular complexes have a different form, but this difference is not due to the difference in the two types of systole mentioned above The form differs according as the auricular contraction precedes or follows the ventricular contraction, but this does not explain the entire difference in the form of the complex The patient was a woman of 72 years and the original diagnosis of Stokes-Adams syndrome

This we see in exhausting fevers with circulatory weakness, although in such cases we do see this develop as a sequel after apparent recovery The author sums up what he regards as an amplification of our knowledge of thrombosis as follows In all spontaneous thrombosis without any demonstrable alteration in the endothelium, we should assume the existence of an alteration in the ability to react which normally subsists between the vascular wall and the blood The enhanced reactivity is of the nature of a sensibilization and supplies the readiness to form the thrombus The next factor is a change in the absorptive faculty and behind this such factors as slowing of the circulation, plug formation in the capillaries (compare the formation of renal casts), and other favoring factors — *Munchener medizinische Wochenschrift,* February 15, 1929

The Association Between Leucoplakia and Squamous-Cell Carcinoma in the Upper Urinary Tract.—Most authors, in discussing leucoplakia of the urinary tract, have stressed its importance as a forerunner of carcinoma, and those dealing with carcinoma have almost universally ascribed its development to a preceding leucoplakia Nevertheless, their actual association in one individual is limited to only a few cases It is upon the actual association of these two conditions that F S Patch has focussed his attention Collating the various reviews of reported cases of leucoplakia, and adding two of his own, he has found 123 cases of this condition and 152 cases of carcinoma involving the kidneys, ureter, and bladder Cases of carcinoma of the bladder were the most numerous, totaling 110 A study of the records of these cases revealed the simultaneous occurrence of leucoplakia and carcinoma in 13 cases, which are described as fully as the records permit In Patch's case there was an almost universal leucoplakia of the upper urinary tract, associated with squamous-cell carcinoma of the bladder and one kidney Microphotographs of sections removed during an exploratory operation showed acute and chronic cystitis, leucoplakia, precancerous lesions, and squamous-cell carcinoma The tumor-bearing areas showed both leucoplakia and squamous-cell carcinoma, rich in pearl formation, extending into and destroying the kidney and bladder tissues —*New England Journal of Medicine,* February 28, 1929, cc, 9

Certain Applications of Malaria in General Paralysis—A Marie refers to the pioneer work of Wagner-Jauregg and the cumulative testimony which now makes it a duty to treat paresis by this method Personally, since 1923, he has treated over 200 cases of the latter in men and 15 in women Of the 200 men 123 could be followed up and of 44 discharged 6 have since relapsed One of this number was again discharged cured while 2 died and 3 are stabilized in relapse. Of the series of 15 women 7 were discharged in remission while the others are unimproved or dead Elsewhere the author claims 36 cures or persistent remissions of which number 18 are perfectly adjusted to their environment The percentage of remissions, irrespective of the ultimate outcome, is nearly fifty in both sexes This figure agrees with the results obtained by various others, these running from 40 to 50 per cent. In regard to external evidence of recovery the author has 9 patients with negative Wassermann after 3 years and 7 more recent cases in which the seroreaction was attenuated He discusses artificial malaria and its peculiarities, and says that, while a few patients suffer from enlarged spleen or other untoward manifestations, the great majority respond readily to average doses of quinine In regard to malarial treatment of ordinary cerebral syphilis and secondary syphilis the author seems to have had no personal experience In regard to non-syphilitic cerebral diseases he has begun to test the method in post-encephalitic "parkinsonians" and in dements and epileptics under his asylum care, but thus far it is much too soon to publish results It is of course highly important that the Wassermann test be made in all such cases But only a minority of asylum patients give positive reactions, save of course those suffering from paresis Even in cerebral syphilis most of the patients give a negative seroreaction —*Bulletin de l'Académie de Médecine,* February 5, 1929

Gastric Fistula in the Treatment of Progressive Bulbar Paralysis—M Seige and O Harzbecker write briefly on this subject Treatment of this affection is at present without comfort, for the local motor paralyses cannot be arrested and the patient can hardly survive for more than three years, the shortening of life bearing a close relationship to interference with nutrition and also aspiration pneumonia As a rule the higher cerebral functions are not disturbed so that the sufferings of the patient are enhanced greatly Since feeding with the sound is a recognized procedure for occasional use it is but a step to the placing of a gastric fistula which should prolong life in two directions—the maintenance of nutrition and prevention of aspiration pneumonia The technique is important and catgut should never be used, for we do not wish the sutures to be absorbed by any contact with the gastric juice The patient should be nourished with milk, eggs, wine, concentrated foods, etc, and may chew morsels which are to go later into the tunnel, thus securing at once some predigestion and the pleasure of tasting the foods Thus far the authors have treated three cases in this manner The first was in a woman of 67 and in 5 months after the fistula was made she regained 13 pounds of the weight lost She still lives after 3 years and recently was shown to a local medical society Another patient was operated on too late and the at-

LEGAL

By Lloyd Paul Stryker, Esq
Counsel, Medical Society of the State of New York

THE CRIMINAL LAW IN RELATION TO CONTRACEPTION AND PRIVILEGED COMMUNICATIONS

The object of this editorial is to discuss two questions about which counsel has constantly been consulted by various members of the medical profession The first is When may a physician lawfully give advice and prescribe for contraception? The second Does the statute, which provides that communications made to a physician by a patient are privileged, apply to a criminal action as well as to a civil action? Its application to a civil action has been discussed in a previous editorial (New York State Journal of Medicine, March 1, 1929), and the reasons for the adoption of the statute by the legislature have also been set forth in that editorial

Section 1142 of the Penal Law of this State makes it a crime to sell, give away or exhibit, or to advertise for sale or distribution, any article or drug for the prevention of conception or for causing unlawful abortion, or to give information as to when and where such article or drug can be obtained The Penal Law makes an exception with respect to the use of such instrument by a physician, for it provides in Section 1145 that an article or instrument used or applied by physicians lawfully practicing or by their direction or prescription, for the cure or prevention of disease *is not an article of indecent or immoral* nature or use within this article, the supplying of such articles to such physicians, or by their direction or prescription, is not an offense under this article

Thus, in the Byrne case[1], the court held that under Section 1145 of the Penal Law, a physician would be justified in prescribing the prohibited article or drugs if, in his opinion, the health or condition of the patient required it

In the Sanger case[2], the Court of Appeals held that physicians were excepted by Section 1145 of the Penal Law, from Section 1142 of the Penal Law The Court of Appeals said "This exception in behalf of physicians does not permit advertisements regarding such matters, nor promiscuous advice to patients irrespective of their condition, but it is broad enough to protect the physician who in good faith gives such help or advice to a married person to cure or prevent disease" The court then quoted with approval the definition of disease as given in Webster's International Dictionary It said "'Disease' is defined to be 'an alteration in the state of the body, or some of its organs, interrupting or disturbing the performance of the vital functions, or causing or threatening pain or sickness, illness, sickness, disorder * * *'"

Thus, under these decisions, a physician who in good faith gives advice or prescribes and treats a patient for contraception, is not guilty of violating Section 1142 of the Penal Law if in his opinion the health or condition of the patient required it

The statute relating to communications made by a patient to his physician is set forth in Section 352 of the Civil Practice Act, which reads 'A person duly authorized to practice physic or surgery, or a professional or registered nurse, shall not be allowed to disclose any information which he acquired in attending a patient in a professional capacity, *and which was necessary to* enable him to act in that capacity, unless, where the patient is a child under the age of sixteen, the information so acquired indicates that the patient has been the victim or subject of a crime, in which case the physician or nurses may be required to testify fully in relation thereto upon any examination, trial or other proceeding in which the commission of such crime is a subject of inquiry"

The statute, therefore, expressly provides that where a patient, a child under the age of sixteen, has been the victim or subject of a crime, the physician may testify fully in relation thereto in any examination, trial or other proceeding in which the commission of such crime is a subject of inquiry, irrespective of whether or not the patient waives the statute

In People v Pierson[3], the defendant was indicted for causing the death by poison of one Withey Upon the trial of the action, the physician who prescribed for and treated the victim of the crime was called as a witness, and he was asked to state the condition which he found The court permitted the testimony of the physician to be given, holding that the statute relating to privileged communications did not render the physician incompetent, as the statute had *no application* to the case, holding that the statute was not designed to protect a murderer, and also upon the further ground that it would be extremely difficult, if not impossible, in most cases of murder by poisoning to convict the murderer if the testimony of the physician who examined or treated the victim of the crime was not available

In People v Silney[4], the defendant was in-

was changed with the progress of the case The patient has been under observation about six months and is at present in good condition with a pulse of 64 to 72 (it was originally 32) She has been free from the syncopal attacks for weeks (these were formerly associated with the crises of pseudo-heart block) The crises seem to have been present since the age of 28 No treatment is mentioned and apparently the causes of the attacks are quite obscure —*Archives des maladies du coeur,* March, 1929

Experimental Psychopathology — E Joël and F Fränkel, who have for some years been investigating the psychic phenomena due to drug action (pharmaco-psychology), make one of their reports with special reference to the action of cocaine and cannabis indica Dextrococaine is known to differ notably in its action from laevococaine, our common cocaine, being much less toxic and also free from action on the psyche Having made tests on animals, the authors tested dextrococaine on themselves and obtained the same striking differences Various explanations may be made as to why two isomers should show such differences, but the one which harmonizes best with the facts is that of the difference in the receptors, that is the two drugs make use of two different sets of brain receptors The authors have done further work on cannabis indica with especial reference to an antagonism or synergism between it and cocaine Intravenous cocaine is able to abolish the psychic effects of cannabis for the time being, but as the action of cocaine is more fugacious, those of cannabis reappear while the subject is still under cocaine influence with the production of composite pictures of various kinds In regard to the occurrence of a true cocaine addiction, the possibility of which has often been denied, the authors have modified their original views and are now inclined to disbelieve in its existence This conclusion can be reached satisfactorily only through self-experimentation Systematic increase of dose results always at first in the same threshold of activity and duration of action, although with a tolerance to the increase of dosage Later, however, the tolerance abates Under continuous use certain phenomena may develop which, however, do not speak in favor of true tolerance —*Klinische Wochenschrift,* March 19, 1929

Injurious Effects of Irradiated Food Substances —Ph Bamberger of the Greifswald University Pediatric Clinic has checked up the results of Hess of New York in this direction with his personal experience, and while he also notes some of these ill effects he does not, like Hess, attribute them to overaction or hypervitaminosis but rather to some admixture or decomposition The substance used was irradiated ergosterol and Hess found only two cases of injury in 22 children, the symptoms supervening late (25 days) and consisting of loss of weight, rise of temperature, vomiting, somnolence, and albumin and casts in the urine Bamberger, on the other hand, saw 10 of 11 children develop symptoms, some quite early (five days), the symptoms comprising loss of weight in six out of 10, vomiting at times persistent, somnolence, and signs of renal irritation Temperature rise was not noted Hess based his claims of hypervitaminosis on a too precipitate cure of the rachitic symptoms and an excessive calcification which involved the epiphyses, but Bamberger obtained no evidence whatever of this outcome His serum analyses also showed a difference between the action of ergosterol and that of concentrated cod-liver oil In both there is an increase in the serum calcium and phosphorus, but with the oil this is compensated by a decrease in the sodium and chlorine, while in the case of ergosterol the two last named elements are also increased Bamberger believes that this behavior may stand in some relationship to the renal damage No evidence is adduced to show that foreign admixture or decomposition is responsible for the other symptoms —*Deutsche medizinische Wochenschrift,* March 8, 1929

Carbuncle of the Kidney —Thomas D Moore presents the detailed findings in 31 cases of carbuncle of the kidney which he has collected from the German and American literature, and adds two cases of his own He thinks this unusual condition is often overlooked because of its usual association with perinephritic abscess, and because of the difficulties of definite diagnosis Of the 33 cases, 12 were in women and 21 in men Pathologically, a renal carbuncle closely resembles one of the skin The chief clinical features of the disease are (1) The history of a recent suppurative lesion such as a furuncle or carbuncle, (2) dull pain in the region of the affected kidney, associated with tenderness in the costovertebral angle, fever and sweats, and sometimes rigors, (3) the laboratory findings usually include a practically negative uranalysis, moderate leucocytosis, and a positive culture of *Staphylococcus aureus* from the affected kidney, the function of which may be moderately diminished Cases in which the carbuncle occupies the upper pole of the kidney may give practically no localized symptoms The onset of the renal symptoms usually occurs from one to six weeks following the initial infectious lesion Surgical intervention is generally indicated, nephrectomy being the operation of choice In cases complicated by perinephritic abscess preliminary drainage is desirable prior to nephrectomy Both of the author's patients recovered, one following nephrectomy, the other after intravenous chemotherapy (20 c c of 1 per cent mercurochrome) This case he believes to be unique, as he can find no other one in the literature which did not require surgical treatment —*Southern Medical Journal,* April, 1929, xxii, 4

the doctor first saw him he found a double suppurative otitis media of about four weeks duration The doctor treated the patient on three successive days, examination being made of both ears, perforations in the drum membrane were of moderate size, situated in the posterior superior quadrant with a fair amount of pus coming out The hearing of both ears was impaired About two days later the doctor advised the patient that a mastoid operation might be necessary on the right ear as it was becoming worse However, treatment was continued for about two weeks, the treatment consisting of the making of an incision by means of the otoscope in an attempt to drain the pus from the right ear The doctor then performed a simple mastoid on the right side and was assisted by a physician who administered the anaesthesia, an assistant surgeon and a registered trained nurse Because of the inability of the patient to pay the hospital expenses the operation was performed at the patient's home. Prior to the operation the customary and usual antiseptic precautions and preparations were done by the doctor, his assistants and the nurse In performing the mastoidectomy a classical incision was made in the mastoid bone It was found to be thick and dense When the doctor came upon the cavity he found a large quantity of pus The doctor feeling that the lateral sinus was probably exposed, used great care on account of the danger of puncturing the same He did find the lateral sinus exposed for a distance of three-quarters of an inch by a half inch A peri-sinus abscess existed After cleaning out the sinus thoroughly he went into the region of the facial nerve and remarked to the anaesthetist and his assistant that he would have to use very great care on account of the danger of the facial nerve being exposed. The doctor asked the anaesthetist to watch the face while he was using the curette in that region While thus using the curette the doctor noticed a slight twitch and immediately desisted from further curetting The operation was finished in about one hour and ten minutes The operative field was dressed and bandaged and the patient put to bed The defendant doctor remained until the patient had come out of the anaesthesia, at which time there were no signs of a facial paralysis He saw the patient again the evening of the day of the operation, about eight hours after the operation, examined him and found no evidence of facial paralysis On the following day the condition was quite satisfactory, the patient remarked that he felt better, but to the doctor it was questionable whether or not there was any sign of a facial paralysis The doctor did an outside dressing, but did not remove the packing On the following day the patient had a marked but not complete facial paralysis of the right side The dressing and packing were removed and the wound redressed The mastoid region was abnormally diseased, the infection which had existed for some time had caused a marked necrosis of the mastoid bone The doctor continued to see the patient at frequent intervals of every other day or so for about two weeks, at which time the mastoid wound had healed, but the facial paralysis was still quite marked The doctor advised the patient to have facial massage and that later the patient should have electrical treatment This was the last time that the doctor saw the patient, although the patient had been directed to return

The plaintiff's attorney examined the defendant before trial and gave every evidence that he intended to prosecute his case, but after the case had been sent from the general calendar to a part for trial and before the trial commenced, he discontinued the action, thus terminating it in the doctor's favor

---

HUSBAND'S CLAIM FOR LOSS OF SERVICES CLAIMED TO BE DUE TO DEFENDANT'S NEGLIGENCE IN TREATMENT OF WIFE

In this case the husband brought an action against the defendant for the loss of services of his wife, claiming that the defendant performed an operation upon his wife in such a negligent manner as to cause her severe injuries A significant fact in this case was that although the complaint charged injuries to the wife she brought no independent action against the doctor

The doctor was called to see the wife of the plaintiff at her home and on examination she appeared to have an inflamed appendix or ovary He advised the application of an ice bag and then left, the patient saying that she would call him if she needed him About a week later he was again called and on that occasion made a careful vaginal examination and found the right tube inflamed. He advised her to remain in bed and use the ice bag She told him not to come again unless he was called He was never called in again The doctor never operated on the woman, but some time thereafter her husband called on him saying that he did not treat his wife properly and demanded the doctor to pay his some money The doctor put him out of his office and shortly after that this suit was begun

When the case was about to be called for trial, the plaintiff's attorney discontinued the action

dicted for murder A physician, who had been sent by the District Attorney to ascertain and report as to the sanity of the defendant, was permitted to testify to the admissions made to him by the defendant, the court holding that the statute prohibiting the disclosure by a physician of information acquired while attending a patient in a professional capacity, had no application, in that the relation of physician and patient did not exist between the physician sent by the prosecuting attorney and the prisoner, since he was not acting as a professional adviser of the defendant.

In People v Murphy[5], the defendant was indicted upon the ground that he aided in committing the crime of abortion The evidence on the part of the prosecution tended to show that the defendant arranged with one, Dr S , to perform an operation to procure an abortion, and took the female to the office of said doctor where the operation was performed After the discovery of the commission of the crime, the District Attorney sent a physician to attend the girl, he called upon her, made an examination of her person, and prescribed for her Upon the trial, the Court of Appeals held that Section 352 of the Civil Practice Act, relating to privileged communications, applied to criminal actions, that the relationship of physician and patient in this case was established, and that the communications which the female had made to the physician, and those things which he had learned from his examination, were privileged, and that therefore, the physician was incompetent to testify to those communications and to those facts which he found upon examination of the patient

The court in the Murphy case distinguished the Pierson case by saying "* * * in that decision the statute was construed, and we held it did not cover a case where it was invoked solely for the protection of a criminal and not at all for the benefit of the patient, and where the latter was dead so that an express waiver of the privilege had become impossible The present is a different case Here the patient was living, and the disclosure which tended to convict the prisoner inevitably tended to convict her of a crime, or cast discredit and disgrace upon her"

It, therefore, follows from these decisions that where the victim of a crime is treated by a physician and is living and has not waived Section 352 of the Civil Practice Act, the physician treating or advising such victim is prohibited by Section 352 from testifying to the communications made by the victim to him, which enabled him to act in his capacity as a physician, and to such findings which his observation and examination of the patient disclosed The records which a physician makes in connection with his treatment of the patient are likewise privileged

A physician, therefore, is prohibited by Section 352 from testifying to the communications made by any patient to him which enable him to act in his capacity as a physician, and is also prohibited from testifying as to such findings which his observation and examination of the patient disclose, unless there is a waiver of this section

The courts, in issuing warrants for the seizure of the records of a physician who is charged with committing an unlawful act, should limit the seizure to those records which relate to the case of the complaining witness, and should not permit records relating to other patients to be seized

If warrants are to be issued indiscriminately permitting the seizure of the records of physicians, irrespective of whether they relate to the case of the complaining witness or not, it would open the door to the disclosure of secrets revealed when consulting a physician, and would destroy the confidence between the physician and his patient, and would thus tend to prevent the advantages and benefits which flow from the relationship of physician and patient. If the privilege could be destroyed at the mere whim of the police, the patient, upon consulting a physician, would not disclose secrets which he would ordinarily disclose, and it would therefore, perhaps prevent the physician from properly prescribing for the patient

OTITIS MEDIA—CLAIMED NEGLIGENCE IN MASTOID OPERATION

In this case the patient charged that he employed the defendant physician to cure him of a disease of his right ear, and that in the treatment thereof the defendant advised him that it was necessary to perform a mastoid operation, that the plaintiff relying upon the defendant's advice consented to the operation, but that the defendant conducted himself in such a negligent manner, that the plaintiff was caused to suffer great physical injuries Damages were prayed for in the sum of $50,000

The plaintiff was a middle-aged man and when

uates of last year if carried out, would mean that only 6,000 of the 20,000 nurses would work every day

The 137 schools in our state are graduating more nurses than can be employed This situation is manifestly unfair to the nurse and furnishes no help for the economic problem of the patient or the physician Among the many ways suggested to reduce the number of graduates, is that of raising the standards of admission to schools of nursing, so as to require a minimum of four years of high school, or the equivalent. Your committee believes that this suggestion is fundamentally sound and recommends its adoption as a preliminary step toward desirable modification of training in the nursing schools

Nearly every one completes a high school course in these days, when there is so great emphasis on educational requirement for nearly every occupation, and the physician is best served by nurses whose education guarantees a fair degree of intelligence

Your committee heartily approves of the visiting nursing service as a real relief economically to many patients and believes that as it becomes better known there will concurrently grow an increasing employment of part-time nursing in every field

Your committee again recommends extension of the visiting nursing service wherever possible

The accompanying illustrative diagrams are furnished through Dr Sloan of our committee, and serve as part of a progress report.

Description of Diagrams

The accompanying diagrams give a comparison of the work of the Utica Visiting Nurse and Child Health Association since it was formed three years ago While many consider the circle or pie diagram less accurate than many of the other forms of graphs or diagrams, still since this is not a detailed analysis of the work, it will no doubt serve our purpose

Of the four diagrams, the first represents the Expenditures and Earnings for the years 1926, 1927 and 1928 While our earnings have shown a steady increase since 1926, still our expenditures have increased considerably due to the need of larger office quarters and added equipment, and we find our

NEWS NOTES

REPORT OF THE FIRST DISTRICT BRANCH

To the House of Delegates

Gentlemen

The activities of the First District Branch Society began with a dinner given by the President to the members of the Executive Committee at the Cornell Club during June for the purpose of arranging a tentative program for the October meeting of the Society

The resignation of Dr Ralph O Clock as Secretary was received and accepted with sincere regret Dr I J Landsman, of The Bronx, was appointed Acting Secretary for the remainder of the year

After a considerable discussion a suitable program was arranged and decision made to hold the annual meeting at the Briarcliff Lodge, Briarcliff Manor, on Thursday, October 18, 1928

The regular annual meeting held in October at Briarcliff Lodge was fairly well attended considering the location of the meeting At the Executive Session the following officers were elected for two years

President, George B Stanwix, M D, Yonkers, First Vice-President, John D Kline, M D, Nyack, Second Vice-President, G K. Deyo, M D, Poughkeepsie, Secretary, I J Landsman, M D, New York, Treasurer, John C Howell, M D, Newburgh

Luncheon was served after the Executive Session At the Scientific Session in the afternoon, addresses were made by the President, Dr Harry Trick, Dr James E Sadlier, and Dr John A Card on affairs of the Society

The following scientific program illustrated by lantern slides was presented

"Diagnosis of Œsophageal Lesions," by Pol Coryllos, M D, New York

"Painful Scars and Their Treatment," by Frederic W Bancroft, M D, New York

"Diagnosis and Treatment of Infections of the Hand," by Henry W Cave, M D, New York

"Serum Treatment of Pneumonia," by Henry T Chickering, M D, New York

"Oxygen Treatment in Pneumonia," by Alvin L Barach, M D, New York

On account of the length of the program the merited and well earned discussion which followed was postponed until the end of the session

The meeting adjourned at about 6 o'clock.

Respectfully submitted,

EDWARD R CUNNIFFE, *President*

April 15, 1929

REPORT OF COMMITTEE ON NURSING AND NURSING EDUCATION

To the House of Delegates—

Gentlemen

Your committee has continued an active study of nursing problems during the year, seeking new viewpoints of the economic, social and scientific phases of nursing service as affecting the patient, the physician and the nurse

Members of the committee have appeared before the Board of Regents and before its committee on higher education, presenting suggestions for modification of requirements for education of nurses curriculum The Assistant Commissioner of Education, Dr James Sullivan, has also met with us and your committee reports that all of these contacts were most cordial and promise results of constructive value

The patient, the physician and the nurse are all in economic difficulty The patient is unable to pay for the kind and amount of nursing he thinks he needs, there is little left for the physician after hospital and nursing charges are paid, and the nurse works only eight months of the year

Twenty thousand nurses graduated last year As the average physician employed only one or one and a half nurses each day, the proportion of new nurses to the new 4,000 medical grad-

53% of their entire time on duty in the homes of the patients

Your committee has asked for data concerning demand and supply of practical nurses or attendants of lesser educational equipment than the registered trained nurse, and believes that there are such people whose services would supply a great need, at fees within the means of the average patient. At present they are working without any supervision or control by any agency which correlates their services, or directs them toward regular employment.

Your committee believes that central, official registries could furnish several classes of nursing at graduated fees and with proper character supervision, to supply widely differing demands from patients

A review of the year of 1928 by the Household Nursing Association of Boston, Massachusetts, furnishes food for thought and positive evidence that there is relief for patients in moderate circumstances, if the proper machinery can be erected The report states

1 "Our object is to train women to give nursing care to people who are not seriously ill The year's training begins at the school on Newbury Street, where the pupils spend six weeks learning how to cook for the invalid and family and doing practice work in the house supervised by a teacher

2 Pupils go to hospitals affiliated with us for the remainder of the year and learn to do bedside nursing under the direct supervision of teachers

3 When the year of training is finished we send them out on private duty and they are supervised by registered nurses in our employ for six months before the diploma is given

Entered the school in 1928	121
Graduated in 1928	86
In schools and hospitals Jan 1st	105

Training School for Nursery Maids

4 The object of the nursery maid school is to train girls to care for well children in private families Like the attendant nurses' course, the training begins in the school on Newbury Street, where the pupils spend four weeks studying cooking for children and child hygiene and doing practice work in the house

Entered the school in 1928	33
Graduated in 1928	22
In the school at present	9

Registry

5 The object of the registry is to place the graduates of the school on cases within their ability to undertake and to be responsible for the service they give their patients

The largest number of cases filled by the registry in 1928 was for the care of grippe, colds and convalescent pneumonia, 352, the next largest for post-natal cases, 336, the next for the care of children, 235 Convalescent surgical, 206, care of old people, 170, shock and paralysis, 136, cardiac, 115, mental and nervous, 115 The balance of the cases were for the care of convalescent medical, rheumatism, carcinoma and chronic invalids

Number of cases filled in 1928	2,289
Number of cases unable to fill	679
Attendant nurses working on registry January 1st	277
Attendant nurses doing their six months' supervised work	50
Supervising visits made in 1928	1,667

Maternity Service

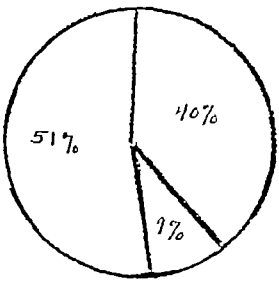
6 The object of the maternity service is to furnish nursing care at confinements for people of moderate means who prefer to stay at home rather than go to a hospital Two registered nurses are on call day and night and remain on the case from six to twenty-four hours as necessary Our attendant nurses are in great demand for the after-care of mother and baby

For a year and a half we have taken night calls for the Brookline Friendly Society We were very glad of the opportunity which came in September to send one of our maternity nurses every morning to the Brookline Friendly Society for visiting nursing

Cases covered in 1928 (47 of these were for the Brookline Society)	195
Operations covered	12
Hourly Nursing Visits made	43
Supervising Visits made	141

Your committee is observing with great interest the work of the Committee on the Cost of Medical Care, and the Committee on the Grading of Nursing Schools, believing that from the large amount of data gathered by these agencies, deductions will be possible which will help us to better understand nursing problems, and show the way to a constructive program for an improved service for the sick

Respectfully submitted,



NATHAN B VAN ETTEN, *Chairman*

Time in Child Health Stations 6%

earnings have been only 27% of our expenditures the past two years as compared with 31% in 1926 We also need to keep in mind when comparing our expenditures with our earnings that we are carrying, not only the Bedside Care Service, but the Infant, Preschool and Prenatal work, with four Child Health Stations This naturally makes our earnings seem smaller in proportion than those of many organizations doing only the Bedside Care service

The second diagram shows the comparison of Bedside Care visits paid in full by the Metropolitan and John Hancock Life Insurance Companies and by Patients, the visits paid in part by Patients, and the visits made free. The variance in our proportions for these three years is partly due to the large increase in our total Bedside Care visits which has been about 6,000 in number since 1926 There has been a gradual increase in our fees from Patients especially the Patients who are unable to pay for the full cost of the visit. There has also been a considerable increase in the free visits, but this is not surprising when we consider the industrial conditions of Utica We feel confident that as the service becomes better known throughout the city that more patients who are able to pay the full cost per visit will use the service

The third diagram shows what percent of our total visits were Bedside Care, Advisory and Miscellaneous Our Advisory visits include the instructive visits to Infants, Preschool and Prenatal cases It is often felt that the Advisory or Welfare work is quite neglected when the Bedside Care service is added, but our number of Advisory visits has increased over 10,000 since 1926 when we took over the Bedside care work

The fourth diagram is an analysis of the nurses' hours on duty The organization has not as yet been able to furnish any cars for transportation and our street car service is rather inadequate, nevertheless, we are pleased to find that during 1928 the nurses have spent

53% of their entire time on duty in the homes of the patients

Your committee has asked for data concerning demand and supply of practical nurses or attendants of lesser educational equipment than the registered trained nurse, and believes that there are such people whose services would supply a great need, at fees within the means of the average patient At present they are working without any supervision or control by any agency which correlates their services, or directs them toward regular employment.

REPORT OF THE COMMITTEE ON THE PREVENTION OF DIPHTHERIA BY THE USE OF TOXIN-ANTITOXIN

To the House of Delegates

Gentlemen

Your committee reports frequent conferences with County Medical Societies, the State and local Health Departments, the Department of Education, the Metropolitan Life Insurance Company and the State Committee on Tuberculosis and Public Health While the numerical goal of 1,250,000 immunizations set for the three years 1926, '27 and '29 was not reached, the immunizations of over 500,000 children in this period had a remarkable influence in reducing the case rate and death rate in some sections of the State and has inspired local health departments and influential lay and medical organizations to increased activities which promise a control of diphtheria hitherto believed impossible

Although it is inevitable that physicians must carry on the work after active campaigns have ended, the education of the public which has been so vital to the results already accomplished must be continued indefinitely if the same or better control is to be maintained

In many counties practising physicians through the stimulating influence of local committees have carried on effective campaigns and it is worthy of note that in the City of New York where there has been very active official stimulation, more than forty-five per cent of the completed immunizations have been done by private physicians

The press of the whole country is contributing wide publicity and many news clippings show that the presence of a single case of diphtheria in a town is considered important news

Without regard to limits of specialization physicians must accept their responsibility and perform or direct immunizations as a community obligation

The parental obligation will be obvious if they shall have been sufficiently educated through the wide dissemination of information by lay and official organizations Local opinion will condemn them for a death from diphtheria or for contacts which shall spread the disease

There are still many deaths caused by neglectful or ignorant delay in consulting physicians until it is too late for the curative effect from antitoxin, but we may be confident that public health education will reduce this number

Dr Matthias Nicoll, Jr, State Commissioner of Health, says "Incidence and mortality from diphtheria in New York State have now reached the lowest point in the history of the State, largely as a result of the anti-diphtheria campaign Were it not for the excessive number of cases coming from the cities of New York and Buffalo, the figures would be very much more impressive The present campaign in Buffalo promises to bring good results, while that conducted by Health Commissioner Wynne in New York City is making splendid progress Intensive campaigns for the eradication of diphtheria have been and will be conducive to good results It cannot be doubted that their value will be on a diminishing scale as they will arouse less and less local interest as the number of cases of diphtheria continue to decline, with the result that people lose their fear of the disease This phenomenon is familiar in the case of smallpox, and the difficulty of enforcing the vaccination law It is therefore imperative that the medical profession should be brought to a realization of their obligations —each doctor to his own patients—in bringing about the immunization of young children under his care

"If we analyze carefully the task which we have before us in the eradication of diphtheria, the problem is not quite as difficult as it would seem to be Briefly stated, it is only necessary by public health education and the stimulation of public and professional opinion to 'mop up,' as it were, by the immunization of the children of the State who are now susceptible to diphtheria When that has been done year after year, it will be necessary only to keep up with the annual birth rate, so that the number of children to be protected, while very large, is by no means appalling With the co-operation of the medical profession, the State and local health officials and the non-official agencies, there can be no question but that the goal which we are seeking in the campaign to eradicate diphtheria from the State can, within a reasonable time, be reached"

Cardinal Hayes writes in a pastoral letter "It has been demonstrated time and time again that any community that makes up its mind to save its children from diphtheria can do so The procedure is simply that of bringing home to our fathers and mothers continuously and repeatedly through every channel of information the fact that their children may be safely and without harm immunized against diphtheria by a physician in his private office, or at a public clinic As an opportunity for public health service, diphtheria prevention is now ranking in the very fore-front of social progress We have the high authority and responsibility of the New York City Health Department under its able Commissioner, Dr Shirley W Wynne, for the initiation of thorough co-operative community action for the eradication

of diphtheria When a procedure such as diphtheria immunization is recommended and approved by our National, State and City health authorities and officials, as well as by the scientific opinion of the world, would it not be shortsighted and reactionary not to gladly accept this life-saving treatment for helpless innocent children?"

Dr Shirley W Wynne, Commissioner of Health, City of New York, says "For some time those interested in public health in New York have felt that the morbidity and mortality from diphtheria constituted a reproach to the city With our scientific knowledge for the prevention of this disease, it seemed that our death rate, twice as high as that for the rest of the State, exclusive of New York City, was too great a tribute exacted by the indifference and innocent ignorance of parents In the City of New York last year, 642 children died and 10,776 were stricken with diphtheria If there was an assembly hall large enough to hold 17,000 children and those responsible for such criminal waste of innocent lives would be made to answer summarily for such negligence, 642 of them were killed and 10,776 were stricken, it would constitute one of New York's greatest tragedies And yet, just that has happened in a more subtle, less tragic way right here in New York with all of its doctors, health officials and social organizations Had we applied the scientific knowledge and resources at our command, not one of these children need have died—not one need have suffered

"In order to successfully combat diphtheria in New York it is necessary for us to immunize every child that reaches its first birthday There are, each year, in New York 125 000 babies who reach that first birthday This new yearly population alone is equivalent to the whole population of Salt Lake City Early in the campaign some guiding policies were established They were

"That insofar as is consistent with the public health, the work of immunizing children should be done by private physicians

"That vigorous steps be taken and facilities established to immunize all children who come from families where there are no family physicians

"That as a Health Department we would carry on an educational campaign directing people to private doctors to overcome the ethical prohibition against a doctor beckoning to practice

"If it was found after a fair test that the medical profession as such was not able to control diphtheria by its own industry and ingenuity the Health Department would have to take such measures as it found necessary to wipe out this preventable disease Every piece of literature, every spoken address, advises first that the public go to the family physician for treatment

"All projects of the campaign are co-operative projects in which the County Medical Societies share Our plans to enlist the co-operation of the private physician appear to be highly gratifying, for while we have given 5,746 children at our special immunization stations, a complete course of three injections, the amount of Toxin-antitoxin supplied by the Department of Health and by the commercial laboratories indicates that private physicians have completely immunized about 4,500 children during the past four weeks In other words, over 40 per cent of all the children immunized since January 1st have been immunized by private physicians These figures are an effective answer to those who have objected to the activities of health officials as encroaching on the legitimate economic domain of the private physician"

Publicity Through the State Poster Contest

Over 500 diphtheria prevention posters were prepared by students in 85 high schools of the State, outside of New York City, as the result of a poster contest initiated by the State Committee with the co-operation of the State Department of Education Of these posters, 145 were submitted for state judging at Saratoga Springs in June, from which first, second and third prize winners and ten honorable mentions were selected Approximately $1,000 in prizes were secured by the State Committee from various business and welfare organizations, the most outstanding being a $350 scholarship at the School of Fine Arts, Syracuse University, presented by the State Outdoor Advertising Association The prize winner, a Buffalo girl, is now studying at the University Health statuettes, presented by the Metropolitan Life Insurance Company, were awarded to the schools participating in the contest

The value of this contact with the schools may be judged by the following

The winning poster has been selected for outdoor display and the State Outdoor Advertising Association has contributed $25,000 in space for this showing

Sixty of the posters are suitable for exhibit purposes and have been shown at several meetings, including women's clubs, hospitals, teachers' groups, business organizations, State Conference of Social Work, etc

The contest cleared the way for more effective co-operation in the campaign on the part of the State and Local Departments of Education

Dr Edward S Godfrey, Jr, Director Division of Communicable Diseases, State Department of Health, says

"Not only has the cyclical rise in the up-state

New York diphtheria curve been limited as to height, but it has been materially abbreviated as to duration Such cyclical increases have come in the last two to five years It seems fair to assume that this curtailment is the result of the direct attack upon diphtheria deaths and that we may shortly expect to see the number reduced below the deaths from measles or scarlet fever There are indications too that never again will New York State communities view with equanimity what in the past may have been regarded as a moderate and perhaps an inevitable prevalence Even a relatively slight increase now in diphtheria will induce a response by the public, the medical profession and the public health authorities that will promptly end it"

Health News of March 11, 1929, publishes a "No Diphtheria" Honor Roll for 1928

"A new low record for diphtheria was established in New York State, exclusive of New York City, during 1928—only 2,898 cases being reported as compared with 3,914 cases for the previous year and 4,971 cases for the preceding five-year average

"The number of deaths was likewise the smallest in up-state history, numbering but 221, as compared with 264 for 1927 and 335 for the preceding five-year average

"The case rate was 52 and the death rate 3 9 per 100,000 population Out of the 57 up-state counties 22 went through the year without a single diphtheria death as well as 30 of the 64 cities and villages of 10,000 population

No Diphtheria Cases or Deaths for 1928

"Cities which had neither a case nor a death from diphtheria during the year 1928 Cortland, Dunkirk, Geneva, Gloversville, Johnstown, Newburgh, Oneida, Sherrill and Tonawanda

"Counties which had neither a case nor a death from diphtheria during the year 1928 Cortland, Hamilton, Schoharie and Schuyler

"Cities. Twenty-eight cities passed through the year 1928 without having a death from diphtheria Batavia, Beacon, Canandaigua, Corning, Cortland, Dunkirk, Geneva, Glens Falls, Gloversville, Hornell, Hudson, Jamestown, Johnstown, Kingston, Little Falls, Long Beach, Newburgh, Norwich, Olean, Oneida, Plattsburg, Port Jervis, Rensselaer, Salamanca, Saratoga Springs, Sherrill, Tonawanda and Watertown

"Villages over 10,000 population Eight incorporated villages with populations over 10,000 reported no deaths from diphtheria for 1928 Freeport, Hempstead, Herkimer, Ilion, Johnson City, Mamaroneck, Peekskill and Port Chester

"Counties Twenty-two counties were without a death from diphtheria during the year 1928 Chautauqua, Columbia, Cortland, Delaware, Essex, Franklin, Genesee, Greene, Hamilton, Herkimer, Livingston, Ontario, Orleans, Putnam, Schoharie, Schuyler, Seneca, Tioga, Warren, Washington, Wayne and Wyoming"

Statistical Report on 1928 Campaign Morbidity and Mortality Statistics

A decline in morbidity and mortality below that of 1927 and 1926 (the lowest in the history of the State) is indicated by the following statistics for 1928

*Rates for each state are based on the estimated population for each year

These official statistics and quoted statements are included in this report to illustrate the progress of the campaign, the sentiment regarding the necessity of educating the

general public in the importance of consulting their physicians for the prevention of diphtheria, and the fact that most physicians appreciate their responsibility and are highly co-operative

Your committee recommends a hearty endorsement and continued support of Anti-Diphtheria work by the Medical Society of the State of New York

Respectfully submitted,
NATHAN B VAN ETTEN, *Chairman*

April 15, 1929

REPORT OF THE COMMITTEE ON ARRANGEMENTS

To the House of Delegates

Gentlemen

The Committee on Arrangements for the 123rd Annual Meeting of the Medical Society of the State of New York submits the following report

Arrangements have been completed with the Hotel Utica, Hotel Martin and the Hotel Majestic for caring for the guests at the meeting and for providing rooms for the Scientific Sessions The House of Delegates will meet in the Hotel Utica, reservations for 150 have already been made Arrangements have been made for the dinner for the House of Delegates to be held at the Hotel Utica on Monday, June the 3rd The Scientific Sessions have been divided among the three hotels The sections on Pediatrics, Eye, Ear, Nose and Throat and Dermatology will be provided space in the Hotel Utica Sections on Surgery, Gynecology, Obstetrics and Neurology will be taken care of at the Hotel Martin The section on Public Health will be provided space in the Hotel Majestic. The general Sessions to which all sections are expected to send their members will be held in the Ballroom of the Hotel Martin on Tuesday, June 4th, and on Wednesday, June 5th. The registration for Delegates will be held at the Hotel Utica and the general registration for members at the Hotel Martin

The Garage accommodations are ample The Rampe garage on Oriskany Street connects with the Hotel Utica directly The Hotel Martin garage is located about one block from the hotel These two garages will care for about 400 cars Other smaller garages will take care of the remainder Scientific Exhibits have been assigned to two rooms at the Hotel Martin These rooms are adjoining the rooms in which the Commercial Exhibits will be shown, also at the Hotel Martin Your committee has taken the liberty of referring the Women's Medical Society, the Bacteriologists Society and the School physicians to the Hotel Martin for Monday, June 3rd, so that the exhibitors may have the advantage of being in contact with those groups It is planned to have the Annual Meeting of the State Society on Tuesday evening, June 4th, at which time your President, Dr Trick, will speak, together with Mr Lloyd Paul Stryker, Counsel for the State Society On Wednesday evening a banquet has been planned which will feature no speakers, but instead a musical entertainment, "The Doctor's Opera," which is being put on by Utica physicians The Committee in charge of the entertainment for the ladies has arranged an automobile trip to be followed by an evening at one of the local theaters In the event of rain, a card party will be held at the Consistory Building instead of the automobile trip

Your committee has planned to have one member of the committee responsible to the Chairman of each section so that any details or matters of arrangements may be taken up without leaving the room in which the section is held

The hotels are co-operating with our committee and are very anxious to give the best service possible We hope to entertain at least 1,200 members of the Society

In conclusion may I thank personally Dr Joseph S Lawrence, the Executive Officer of the State Society, Dr James N Vander Veer, who was Chairman of the Committee on Arrangements for last year, Dr Daniel S Dougherty, Secretary of the State Society, and Dr Arthur J Bedell, Chairman of the Committee on Scientific Work, for many valuable suggestions and courtesies to the committee

Respectfully submitted,
HYZER W JONES, *Chairman*

*Rates for each state are based on the estimated population for each year

These official statistics and quoted statements are included in this report to illustrate the progress of the campaign, the sentiment regarding the necessity of educating the

since there is to be a meeting of the Steuben County Medical Society in Corning on May 15th that Drs Sadlier, Card, Lawrence, Trick, and Ross attend it for the purpose of ascertaining any facts to be learned about the survey

Dr Hambrook moved that the Public Relations Committee of the State Medical Society advise that Dr J S Lawrence, the Executive Officer of the State Medical Society, be its representative in matters pertaining to the survey being made by Dr Freeman in Steuben County This motion was seconded, and carried

W H Ross, *Secretary*

PUBLIC RELATIONS SURVEY IN STEUBEN COUNTY

In accordance with the instructions of the Committee on Public Relations, Drs Trick, Sadlier, Ross and Lawrence attended a meeting of the Steuben County Medical Society in the Baron Steuben Hotel, Corning, N Y, on May 15, 1929, in order to advise with Dr Allen Freeman and the physicians of Steuben County regarding the survey which Dr Freeman is conducting in order to find out what the individual doctors of Steuben County are now doing in Public Health work

Dr Freeman addressing the meeting said

"Public health of the future will become effective along the line of the relation of the doctor to the individual patient The relation of the family physician to the patient is the ideal public health contact. That includes the care of the mother, supervision of infants and the school child, industrial hygiene, and life extension work We now have a conception of what is sound public health—that it is continuous medical service from the prenatal period to death—but we do not know the exact method The problem is worthy of our very best attention, and the solution will be along lines developed by the medical profession We cannot do any of the things by theory, but by practical experience as a guide. Health projects must be directed by medical opinion, and then the machinery for carrying them out will come from the various health agencies"

Dr Freeman has personally interviewed all of the health officers, has sized up the voluntary agencies, and will interview the practicing physicians other than health officers by a questionnaire, which is as follows

The Individual Physician

Name Birth Place Age
Residence Area served
Practice General Specializes in
Education Preliminary, College, Medical, Degrees
Hospital interneship . E
Appointments Hospital, Insurance, Army, Lodge, Company

Activities in Preventive Medicine, 1928

Immunizations	Under 6	6 to 20	Adult	Total
Typhoid vaccinations				
Diphtheria T A T				
Smallpox				

Maternal Hygiene

Prenatal care given cases, average months
Deliveries In Home Hospital
Wassermanns on pregnant women No
Treated, No

Infant Hygiene

No infants under 2 years under your care
No brought regularly for examination and advice
Approx. No children 3-5 years under your care
No of these brought regularly for examination

School Hygiene

No children referred to you by school physicians
No of these in your opinion needing treatment
No of these treated by you personally
No of these treated under your direction

Tuberculosis

No cases tuberculosis under your care
No diagnosed 1928 Early
Mod Adv Adv
No treated at home
No sent to sanatorium
No family contacts examined
No cases found in these contacts

Venereal Disease

No cases treated last year Syphilis
Gonorrhea
No cases discharged as cured Syphilis
Gonorrhea
Family contacts of these examined
Sources of infection found

Periodic Examination

No periodic examinations adults last year
No with important correctible conditions .

Remarks and Comments

Dr Sadlier spoke of the interest of the medical profession in the Steuben County survey, and of the value of the Public Relations Committee of the State Society in establishing proper relationships to health agencies He commended the survey and Dr Freeman, and referred to the State Society surveys in several counties He called attention to the danger in the survey if

PUBLIC RELATIONS COMMITTEE

A meeting of the Public Relations Committee of the Medical Society of the State of New York was held at the Biltmore Hotel, New York City, on Friday, May 10, 1929

There were present Committeemen Sadlier, Johnson, Hambrook, and Ross There were also present by invitation, Dr Harry R Trick, President of the Medical Society of the State of New York, Dr J N Vander Veer, President-elect, Dr John A Card, Speaker of the House of Delegates, Dr Thomas P Farmer, Chairman of the Committee on Public Health and Medical Education, Dr J S Lawrence, Executive Officer, and Dr Frank Overton, Executive Editor

The Committeemen reported on the progress of the Public Health Surveys in the counties of their several districts, Dr Sadlier having secured two surveys, Dr Hambrook, one, Dr Mitchell, one, and Dr Ross, three

The delay in obtaining a greater number of surveys seems to be due largely to a lack of medical leaders in the counties, who would take the trouble to obtain the detailed information and summarize the findings in a report Several committeemen expressed the need of a field worker to assist the local doctors to start the survey, for they felt that the physicians would carry on the work with credit once the survey was started

The Committee then discussed the fee schedule for crippled children which was published on page 171 of the February 1 issue of this JOURNAL Dr Sadlier stated that, of course, this schedule could not be operated until adopted by the House of Delegates He said that only five doctors have been paid for work on indigent children in the State, but that a large number of doctors in the State were doing the work gratuitously An Oswego doctor had expressed himself as opposed to the establishment of a schedule of fees The representatives of the State Departments of Health and of Education have been making some use of this schedule Dr Sadlier has interviewed them and told them that they should not use it until the House of Delegates act upon it A doctor of New York City has registered an opposition to the fee schedule,—not to the schedule itself, but to the general principle involved,—and thought that we should not have any fee schedule These two physicians were the only ones that had expressed opposition to the fee schedule

The consensus of opinion of the Committeemen was that a supplementary report should be made to the House of Delegates requesting that its Committee on Public Health appoint an advisory committee to work with the Departments of Health and Education regarding the administration of the laws relating to the medical treatment and the compensation for medical treatment of the rehabilitation of crippled children, or that the Public Relations Committee be so authorized to act in this capacity It was also suggested that the report should include the following statement 'The State Commissioner of Health, Dr Matthias Nicoll, Jr, said that the Association of County Judges had discussed this matter at their last meeting and had asked me if we couldn't get in some uniform basis of these fees" It was on this basis and my other statements that the committee met and went ahead

Dr Sadlier then announced that the medical survey of Steuben County had been started by Dr Allen Freeman, Professor of Public Health at the Johns Hopkins University, the object being to ascertain the amount of public health work that the doctors of Steuben County had done during the past year or two

There was considerable discussion regarding the identity of the organization that had employed Dr Freeman and sent him into Steuben County It was developed that he was paid by the Milbank Fund which was subsidizing the County Health Department of Cattaraugus County a few miles west from Steuben County, and that he was directed by the State Charities Aid Association which is the operating agent for the Cattaraugus County Administration

The question also arises regarding the extent to which the Milbank and the State Charities Aid Association had observed the eight points of the relations of the doctors to lay organizations, which had been adopted on March 9, 1928, and printed on page 1433 of the December 1, 1928, issue of this JOURNAL, in connection with a report of a meeting of the Public Relations Committee on November 9, 1928 The specific paragraphs whose observation was questioned were No 2 reading, "Laymen must at all times look to the medical men for guidance and leadership", and No 7 reading, "Before any innovations are put into effect by a demonstration or other agency, they should be thoroughly studied and discussed by the Medical Society"

Overlooking the extent and degree to which the operating agent had consulted the physicians of Steuben County and the officers of the State Medical Society, the committee recognized the presence of Dr Freeman in Steuben County as a fact, and expressed the view that it should take steps to ascertain the scope of the survey, and to advise with Dr Freeman on the one hand, and the physicians of Steuben County on the other It was brought out that the Steuben County Medical Society had called a meeting of its Comitia Minora and then changed it to a special meeting of the Society, at which fourteen of its eighty or ninety members were present Later in the same day the physicians met with fifty or sixty laymen and lay representatives of various health agencies in Steuben County although there was uncertainty as to who called the joint meeting It was decided without opposition that

DUTCHESS-PUTNAM SOCIETY

A regular meeting of the Dutchess-Putnam Medical Society was held Wednesday, May 8, 1929, at St Francis Hospital, Poughkeepsie, N Y, and was called to order by the President, Dr C Knight Deyo, at 4 15 P M

Dr J. E Sadlier offered a resolution taking due recognition of the death of Dr D H MacKenzie

Dr John A Card, reporting for the special committee on the protection of water supplies (see this JOURNAL, April 1, 1929, page 413), presented the following resolution which was adopted

WHEREAS, The Hudson River and its main tributary, the Mohawk River, has for many years been a common sewer for the cities and villages along its banks, thereby causing these same bodies of water to be polluted to an extreme degree, and

WHEREAS, These same bodies of water furnish a source of fresh water supply which is inexhaustible and not affected by droughts or diminished rainfall and

WHEREAS, Almost all the cities and villages along these streams are compelled to obtain their water supply from upland sources or resort to expensive purification systems to care for these polluted waters, and

WHEREAS, It has been known that for at least fifteen years past the State Department of Health has refused permission for any increase in the number of trunk line sewers to be emptied into the Hudson River, and

WHEREAS, The so-called upland supplies are also contaminated to a greater or less extent, requiring filtration, purification and chlorination before becoming safe for drinking purposes

Therefore Be It Resolved, That it is the sense of the Dutchess-Putnam Medical Society that the state government through its Department of Health should institute measures looking toward the elimination of sewage disposal into the main waterways of the state,

Be It Further Resolved, That the Dutchess-Putnam Medical Society insist that the pollution of the Hudson and Mohawk Rivers is unnecessary and inimical to the public health of the citizens adjacent thereto,

Be It Further Resolved, that the Dutchess-Putnam Medical Society petition the House of Delegates of the Medical Society of the State of New York to approve the aforesaid resolutions and invest its President with power to appoint a committee whose duty it shall be to confer with the proper state officials and in all ways endeavor to get such action as will lead to an elimination of the pollution of waterways of the state

JOHN A CARD, M D,
WILLIAM H CONGER, M D,
JAMES E SADLIER, M D, *Chairman*

There were addresses by the officers and past officers of the Medical Society of the State of New York Dr Harry R Trick, President, Dr George M Fisher of Utica, Past President, Dr James N Vander Veer, of Albany, President Elect, and Dr D S Dougherty, Secretary

Dr Orrin S Wightman presented movies of Syphilis of the Circulatory System There was discussion by Drs Vander Veer, Fisher, and Sobel.

A vote of thanks was extended to the State Officials and to St. Francis Hospital for the entertainment The meeting adjourned at 6 00 P M

Members present Drs J H Cotter, Wightman, J N Vander Veer, Patterson, Furlong, Toomey, Rivenburgh, Peckham, Boyce, Sobel, C J McCambridge, Gosse, Sadlier, Card, Williams, Dougherty, Trick, Borst, C E Lane, Cavanaugh, J I Cotter, Krieger, Cadwell, Conklin, Bulkeley, Palliser, Deyo, Carpenter, Littner, Locker, Appel, Benson, Fisher, Leonidoff, Burns, Rowe, Howard, Thomson, Dingman, Miss Carter, Drs Max Simon, E Gordon MacKenzie, Stoller, F H Crispell, von Tiling, Grover, Cheney, Bull, Israel

A reception and dinner was given the State Officials by Dr John A Card in the evening

H P CARPENTER, M D, *Secretary*

GREENE COUNTY

Dr W M Rapp, Secretary of the Public Relations Committee of the Greene County Medical Society, has called attention to an incorrect statement appearing in Public Relations County Survey No 7,—Greene County, printed on Page 627 of the May 15th issue of this JOURNAL The residuary legacy to the proposed hospital will amount to $50,000 instead of $5,000 as stated The hospital thus has $100,000 already in sight

wrongly done, and hoped that justice would be done to medical men

Dr Ross spoke of the interest of organized medicine in public health, and said that the representation of the medical profession must be through organized medicine instead of the individual doctor, if we are going to establish the position of the medical profession in public health The mere fact that several representatives of the County Medical Society were here today showed the interest of organized medicine in the study that was going on in Steuben County, and also in the effect that it will have in developing the relationship of the medical profession to the public health program as now developing He said that there are just two things in public health permanently on the card, first, public health must be directed by those who are medically trained, and second, all other health agencies were supplementary and necessary for education of the public and the distribution of the products of any public health program

Dr Trick said that the attempted solutions of all public health programs rest with the medical profession When the State licenses a doctor it gives him a trust to solve the public health programs He is responsible for it The American plan is to meet the problems in public health as they arise, instead of the English plan of laying out a program long in advance He commended the survey, if when it is done, its lessons will be carried out

Dr Leon Keysor of Hornell said "Medicine has changed and the process has been going on for many years Medicine must organize in its own ranks a committee to work with the agencies The public health needs of a county should be carried out by the County Society The Medical Society should direct this themselves Steuben County is doing a good deal of public health work, and the laboratory system is excellent, with its management from within the Medical Society

Dr J A Conway, District Health Officer, said "The survey shows thus far that the doctors of Steuben are doing a good deal of public health work A county health unit has great value, and Steuben should form one It is already equipped to do it, and is already doing many things in line with it Health work in Steuben County is good, but voluntary agencies could be in closer touch with doctors"

Dr Mathewson of Bath, Superintendent of the Tuberculosis Hospital, a retired physician, said that so long as we had to have a survey, it was good that Dr Freeman should do it He said that if this survey will help the modern medical utopia that we are going to have, he was glad that it was going on

Dr Barron, Health Officer of Addison spoke on the comparative morbidity and mortality of contagious diseases, compared with those of "booze"

Dr Hutton of Corning said that he had not been in entire accord with the idea of the survey, but now he believed that he was converted He said, "We have a great many health agencies working individually in this county If we can unite them, it will be of a great deal of benefit I am in favor of that, if this survey will help to bring it about"

The visiting committee of the State Society were unable to obtain an authoritative statement regarding the use to which Dr Freeman's survey would be put The Doctor will submit his report to the State Medical Society at the same time that he sends it to the State Charities Aid Association

W H Ross, *Secretary*

SPECIAL TRAIN TO THE A M A MEETING

The attention of the doctors in New York State is called to the special train to Portland, Oregon, for the benefit of those who expect to attend the meeting of the American Medical Association beginning July 8th

The train offers an opportunity for doctors to enjoy a month's outing with their wives and families It is run by the New York Central Railroad over a route indicated on page 410 of the April 1st issue of this JOURNAL It will leave the Grand Central Railroad Station New York City, on Sunday, June 30th, but will stop at the larger cities through the state The itinerary will last until July 24th, and stops will be made at the Glacier National Park, the Yellowstone National Park, Salt Lake City, and the Denver and Rocky Mountain National Park

The New York Central Railroad has prepared a special folder giving full details of the trip A copy of this folder may be obtained by writing to Mr J S McAndrew, City Passenger Agent, New York Central Railroad Room 1261, 466 Lexington Avenue, New York, N Y

JOHN A CARD, M D

DUTCHESS-PUTNAM SOCIETY

A regular meeting of the Dutchess-Putnam Medical Society was held Wednesday, May 8, 1929, at St Francis Hospital, Poughkeepsie, N Y, and was called to order by the President, Dr C Knight Deyo, at 4 15 P M

Dr J E Sadlier offered a resolution taking due recognition of the death of Dr D H MacKenzie

Dr John A Card, reporting for the special committee on the protection of water supplies (see this JOURNAL, April 1, 1929, page 413), presented the following resolution which was adopted

WHEREAS, The Hudson River and its main tributary, the Mohawk River, has for many years been a common sewer for the cities and villages along its banks, thereby causing these same bodies of water to be polluted to an extreme degree, and

WHEREAS, These same bodies of water furnish a source of fresh water supply which is inexhaustible and not affected by droughts or diminished rainfall and

WHEREAS, Almost all the cities and villages along these streams are compelled to obtain their water supply from upland sources or resort to expensive purification systems to care for these polluted waters, and

WHEREAS, It has been known that for at least fifteen years past the State Department of Health has refused permission for any increase in the number of trunk line sewers to be emptied into the Hudson River, and

WHEREAS, The so-called upland supplies are also contaminated to a greater or less extent, requiring filtration, purification and chlorination before becoming safe for drinking purposes

Therefore Be It Resolved, That it is the sense of the Dutchess-Putnam Medical Society that the state government through its Department of Health should institute measures looking toward the elimination of sewage disposal into the main waterways of the state,

Be It Further Resolved, That the Dutchess-Putnam Medical Society insist that the pollution of the Hudson and Mohawk Rivers is unnecessary and inimical to the public health of the citizens adjacent thereto,

Be It Further Resolved, that the Dutchess-Putnam Medical Society petition the House of Delegates of the Medical Society of the State of New York to approve the aforesaid resolutions and invest its President with power to appoint a committee whose duty it shall be to confer with the proper state officials and in all ways endeavor to get such action as will lead to an elimination of the pollution of waterways of the state

JOHN A CARD, M D,
WILLIAM H CONGER, M D,
JAMES E SADLIER, M D, *Chairman*

There were addresses by the officers and past officers of the Medical Society of the State of New York Dr Harry R Trick, President, Dr George M Fisher of Utica, Past President, Dr James N Vander Veer, of Albany, President Elect, and Dr D S Dougherty, Secretary

Dr Orrin S Wightman presented movies of Syphilis of the Circulatory System There was discussion by Drs Vander Veer, Fisher, and Sobel.

A vote of thanks was extended to the State Officials and to St. Francis Hospital for the entertainment The meeting adjourned at 6 00 P M

Members present Drs J H Cotter, Wightman, J N Vander Veer, Patterson, Furlong, Toomey, Rivenburgh, Peckham, Boyce, Sobel, C J McCambridge, Gosse, Sadlier, Card, Williams, Dougherty, Trick, Borst, C E Lane, Cavanaugh, J I Cotter, Krieger, Cadwell, Conklin, Bulkeley, Palliser, Deyo, Carpenter, Littner, Locker, Appel, Benson, Fisher, Leonidoff, Burns, Rowe, Howard, Thomson, Dingman, Miss Carter, Drs Max Simon, E Gordon MacKenzie, Stoller, F H Crispell, von Tiling, Grover, Cheney, Bull, Israel

A reception and dinner was given the State Officials by Dr John A Card in the evening

H P CARPENTER, M D, *Secretary*

GREENE COUNTY

Dr W M Rapp, Secretary of the Public Relations Committee of the Greene County Medical Society, has called attention to an incorrect statement appearing in Public Relations County Survey No 7,—Greene County, printed on Page 627 of the May 15th issue of this JOURNAL The residuary legacy to the proposed hospital will amount to $50,000 instead of $5,000 as stated The hospital thus has $100,000 already in sight

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on April 17, 1929, was called to order at 9 p m , the President, Dr Aranow, in the Chair

The following candidates were elected to membership Louis Joseph Cassano, Sidney Grossman, Irving L Latter, Jack Levine, Hyman Millman, David N Roginsky, Max J Shulman, Manlio Terragni

Dr Magid submitted the Report of the Committee on Medical Economics This Report will be referred to the Comitia Minora for consideration and report

The Report of the Comitia Minora urging the Society to recommend to the Welfare Council of the City of New York the establishment of a Central Investigating Bureau to avoid duplication and waste of money and effort in treating patients who visit various Dispensaries for the same complaint, was then considered It was moved and carried that the recommendation be approved

The Secretary presented the following Resolutions, similar to those which have been approved by the Medical Society of the County of New York

WHEREAS, Periodic health examination is now recognized by the medical profession as playing an important role in the maintenance of public health, and

WHEREAS, The Bronx County Medical Society believes that such examinations are best carried out under the guidance of the family physician,

THEREFORE, BE IT RESOLVED, That the Bronx County Medical Society invite the other County Societies of the City to join it in the organization of a "Health Examination Week" to take place in October

That the Commissioner of Health be asked to help organize a "Health Examination Week,"

That the public be informed from time to time through the press and other agencies of publicity of the purposes and details of such health examinations, and

That the Chairman appoint a Committee of seven who shall help to bring this plan into effect

Following a discussion it was moved and carried that these Resolutions be adopted

Several Amendments to the By-Laws were proposed

It was announced that the proposed Amendments will be printed in the May issue of the BULLETIN and acted upon at the May meeting

The following Resolutions were introduced

WHEREAS, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Pando Y Kamenoff, M D

RESOLVED, That the Bronx County Medical Society record the sense of its loss in the death of Dr Kamenoff and that a minute thereof be placed on the records of the Society, and be it

FURTHER RESOLVED, That a copy of these Resolutions be transmitted to the family of our departed member

WHEREAS, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Solomon S Spitzer, M D

RESOLVED, That the Bronx County Medical Society record the sense of its loss in the death of Dr Spitzer and that a minute thereof be placed on the records of the Society, and be it

FURTHER RESOLVED, That a copy of these Resolutions be transmitted to the family of our departed member

The above Resolutions were carried by a rising vote

The Scientific Program then proceeded as follows

Papers

1 Etiology and Treatment of Eczema, Samuel Feldman

2 Prognosis of Hypertensive Cardiovascular Disease, William W Herrick

I J LANDSMAN, M D , *Secretary*

WASHINGTON COUNTY

The semi-annual Meeting of the Medical Society of the County of Washington was held at Great Meadow Prison May 14, 1929, at 4 P M Members present Drs Bennett, LaGrange, Paris, Banker, Heath, Tillotson, Borrowman, Vickers Leonard, Prescott, Hulsebosch, Munson, Park, Pashley, Bailey

Drs Ring and Pashley were duly elected to membership

Dr Vickers was made a committee to confer with the directors of the Mary McCleland Hospital as to storage of the State Society Transactions presented by Dr Banker to the County Society, also to have power to have bound volumes of the State JOURNAL at the expense of the Society

Treasurer reported $149 06 in the treasury available for the Society The Secretary was instructed to communicate with Dr Farmer regarding a course of lectures to be held in October on internal medicine, one-half of them at the Mary McCleland Hospital and the other half in Hudson Falls

The President appointed Dr W A Leonard as alternate for Dr M A Rogers delegate to the Medical Society of the State of New York

Dr Paris read some clippings from the Glens Falls *Times* regarding Dr Bankers completing his fifty years in the practice of medicine, and then offered the following resolution

WHEREAS, Our efficient Secretary has completed fifty years in the practice of medicine

Resolved, That the Treasurer be authorized to purchase a professional book, instrument, or other suitable memento of the occasion, and present the same to Dr Banker as a souvenir from this society

Dr Munson offered an amendment, that Dr Banker be consulted, that a committee be appointed, and suggested that a memorial be printed and framed, instead of what Dr Paris had proposed This was approved by the society and Dr Banker The President appointed Drs Paris, Pashley and Munson as a committee to carry out this design

Dr Borrowman read a paper presenting a case of exopthalmic goiter, which was very interesting and instructive

The society then adjourned, and the members were permitted to inspect the prison, after which dinner was served in the officers' mess room Evening session, 7 30

Motion by Dr Munson, that the thanks of the society be extended to the Warden and Commissioner R F C Kiebe for their courtesy extended, and also for the excellent dinner provided.

Dr Hulsebosch read a paper on "The Place of Drops in Refraction of the Eye" Many questions were asked and much discussion provoked

The Vice-President gave his address on the subject, "Medical Work Among the Prisoners of Great Meadow Prison"

Dr Bailey gave a paper on "Brain Tumors, Their Symptoms and Localization" Discussion by Dr Hulsebosch

Dr Davis Baker discussed the subject of "Appendicitis"

S J BANKER, *Secretary*

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at Eagle Palace, Jamaica, on April 30, 1929, the president, Dr W J Lavelle in the chair

Dr A L Volts reported for the Board of Trustees Discussion by Drs H C Courten and J M Dobbins

The following were elected to active membership upon nomination by the Censors

Vincent J Amato, M D, Astoria, Sherman W Bates, M.D, Richmond Hill, and Benjamin F Glasser, M D, Jackson Heights

Dr F G Riley reported for the Legislative Committee, Dr Joseph Baum for Membership Committee, and the Secretary Dr E E Smith for the Comitia Minora and the Publicity Committee Dr James M Dobbins, Chairman of the Special Committee reported on the progress of the Diphtheria Campaign

Scientific Session

(a) Paper "Diagnosis of Heart Disease," by Joseph H Bainton, M D Discussion by Charles Shookhoff, M.D, E F Kalina, M D, and G A Distler

(b) Motion Picture "Consequences"

Shown through the courtesy of the Queensboro Tuberculosis and Health Association

Collation Attendance 75

E E SMITH, *Secretary*

WYOMING COUNTY

The Spring meeting of the Wyoming County Medical Society was held at the Hotel Gridley, April 23, 1929 Following a chicken dinner the meeting was called to order by President Skiff

A motion was made by Dr Thomson that the Society approve the coming State Pre-School Consultations, and that President Skiff appoint a committee to carry out the details of the consultations, including himself (President Skiff) as chairman of the committee Carried Dr Skiff appointed Drs M J Wilson and W J French

President Skiff appointed Drs L M Andrews, W J French and L H Humphrey to send an expression of sympathy to the relatives of Dr J E Slaught

Dr A S Dean of the State Department of Health spoke on the county child health consultations which will be held in Warsaw, May 10th, for babies and children of pre-school age All physicians of the County are invited to attend Application for examination of children are made to Miss Sutherland, the county nurse One purpose of the pre-school consultations is to promote periodic health examinations

Dr Harry R Trick, President of the New York State Medical Society, spoke on "The State Medical Society," dwelling principally on the several ways in which the State Medical Society was of assistance to the County Societies

Dr James E King, Professor of Gynecology, University of Buffalo, spoke on "Some Experiences with Radium" The capabilities of the use of radium in gynecological conditions were clearly presented Several fine lantern slide illustrations were used

Nineteen members and eight guests were present.

HENRY S MARTIN, *Secretary*

MEDICAL WARES

CONTAINERS OF MEDICAL SUPPLIES

The keeping qualities of medical supplies, especially drugs, are of equal importance with their original composition The doctor buying a supply of drugs rightfully expects that they will retain their strength and freshness for months or years The standards of permanency are that the articles shall not deteriorate with age, nor go to pieces with handling, nor be damaged by moisture, dryness or temperature All these conditions are affected by the package in which the articles are shipped The container is of equal importance with the article itself

Doctors take it for granted that manufacturers will supply their products in containers which will preserve their contents under all ordinary conditions Physicians often subject their products to extremes of rough usage Explorers especially must carry supplies that will stay reliable during months of keeping and transportation Physicians in rural districts often put the keeping qualities of their supplies to tests quite as severe as those of travelers in desert land and on the sea

One of the first principles in the preservation of drugs is that dry articles nearly always are more stable than liquids Dry substances are not liable to leakage and breakage nearly so frequently as those in liquid form

Tablets are more stable than powders, largely because they present a surface of minimum area exposed to the air But the manufacturers often find difficulty in adjusting the hardness and consistency of the tablets to the requirements of easy solubility and stability of composition

It is impossible to put up some drugs in dry form, but it is nearly always possible to choose those drugs which can be preserved dry Neither a doctor practising medicine in a rural district, nor an explorer, is compelled to use articles whose transportation and preservation are difficult Both can nearly always find satisfactory drugs in solid form

The packages in which tablets and other supplies are put are also of great importance While it is sometimes said that a container often costs more than what is put into it, yet a physician, either at home or on a long journey, wishes to be assured of the permanency of his supplies, and is willing to pay larger prices for the sake of having the articles in small, reliable packages, each of which may be used up soon after it is opened The ideal package will contain only a single dose of medicine or an article in just a sufficient amount for one application

Moisture is one of the greatest causes of deterioration of supplies, especially drugs Nearly all substances absorb water from the atmosphere, and so they deteriorate rapidly in humid air Special care must therefore be taken with drugs and supplies intended to be kept in moist climates, as those of the tropics

A standard means of protection is that the containers shall be heavy glass bottles whose stoppers are of cork heavily coated with a flexible wax Ground glass stoppers would be best except that they are likely to stick fast so that they cannot be withdrawn Screw caps of metal are sometimes used, but they may corrode so that they may not be removed whole Waxed cork is a reliable material under practically all conditions

Tablets are likely to be worn down by the jarring of the containers It is therefore necessary that the neck of the bottle be packed tightly with absorbent cotton or strips of waxed paper

Small packages of drugs or dressings are put up in such a way that they will stand rough handling The standard form of package consists of an outer carton of pasteboard designed so that it may be opened easily and widely Inside the carton is a shell of corrugated paper, and the container itself is wrapped with a circular of directions which also acts as a further protection There is a special reason for each detail of this standard form of container The directions are especially valuable, for they refresh the mind of the expert doctor who is busy with other details, and they enable expert assistants to prepare the materials for use

The rural doctor, the explorer, and the physician far from a base of supplies each depends on tablets and dressings which are in small packages ready for use Some medical supply houses make a specialty of putting up medical supplies in forms which will insure both permanency and readiness for use These companies will prepare lists of articles suitable for specified conditions, such as those of locality, climate, and temperature A polar expedition would shun liquids as much as possible, while an expedition to the tropics would require supplies prepared under rigid conditions for excluding moisture Manufacturers supply kits of a great variety of forms and sizes suited to all manner of needs of individual doctors and of expeditions

THE DAILY PRESS

THE MEDITERRANEAN FRUIT FLY

The methods of medical epidemiology are applied to the protection of plants against parasites and communicable diseases The newspapers have frequently carried protests about quarantines against infected plants on the ground of the economic loss involved when only a small percentage of a product is involved But the State of Florida, threatened with the loss of citrus fruits valued at $25,000,000 annually, appealed to the National government for protection against the Mediterranean fruit fly, and Congress responded with an appropriation of $4,500,000 The New York *Times* of May 1 commenting editorially on the appropriation says

"Isolation was the protection of the United States while this fly was ravaging not only the countries bordering on the Mediterranean but Tunis, Algeria, South Africa, Brazil and Australasia The vigilance of our inspectors accounted in part for the immunity the United States enjoyed But at last Florida, which produced citrus fruits worth $33,000,000 last year, has been invaded Four counties with an area of forty square miles are infected While the greatest menace is to citrus fruits, the Mediterranean fly feeds on and lays its eggs in other fruits and many vegetables

"The method of dealing with the Mediterranean fly is to starve it out After inspection has shown what fruits and vegetables are harboring it, they must be destroyed Rigid quarantine should save the rest of a crop

"Dr Wilmon Newell, Plant Commissioner of Florida, makes it plain that fruit trees will not be destroyed in any district It is sufficient to deal with growing fruit, but there must be a clean sweep of that

"One natural enemy is known, a wasp-like insect that has been introduced into Hawaii Texas is familiar with the Mexican fruit fly, which, it has been said, is 'an enemy more to be dreaded than insurgents and bandits' California sends an entomologist into Mexico every year to study fly pests"

INDIVIDUALISM IN PUBLIC HEALTH

America is supposed to be the land of individualistic freedom, where every man may indulge in his own personal liberty to any extent short of specific law breaking But England is also noted for individualism as is illustrated by the following editorial on vaccination from the New York *Times* of May 17

"The outbreak of smallpox in England has revived proposals there to make vaccination compulsory One newspaper, arguing that something should be done, sorrowfully admitted that Great Britain remains the last refuge, as it were, of smallpox in the civilized world

"Naturally, the Anti-Vaccination League at once took up arms At a meeting in London speeches were made denouncing the movement for vaccination as a mere mercenary scheme One lady bluntly asserted that 'there is no doubt that the doctors have worked up this scare,' and there were references to the 'great money-making firms who sell vaccine' This evoked cries of 'Shame!' which emboldened the speaker to go on and assert that 'the Golden Calf is behind the whole of this miserable business'

"The fine old extreme of English individualism was seen, however, in the round defiance of any effort by the authorities to stamp out disease by interfering with personal convictions on the subject of health 'Can there be,' exclaimed one lady, 'a worse kind of tyranny than absolutely to claim rights over other people's bodies?'

"This goes beyond the mere matter of vaccination If a government inspector should tell this protester that the food she was eating was infected, she probably would wave her dish-cloth at him and tell him to go off about his own business Then there is the matter of 'drains' and other questions relating to public sanitation If an Englishwoman in her castle refuses to be vaccinated, why should she not also refuse to be disinfected?"

CALCIUM IN THE BLOOD

Ultra-violet rays, cod liver oil, vitamin D, and Blood Calcium are facts whose coordination and interrelation came with their application to the condition popularly called rickets Popular knowledge of these technical relations was aroused by reports of the administration of one of the newer calcium salts to the King of England during his recent attack of empyema. The New York *Herald-Tribune* of May 7 recognizes the public health value of newspaper articles when it says editorially

"Like the curative use of ultra-violet rays, calcium remedies can thank that monarch's illness for public reputation which probably would not have come for years without that unintentional kingly aid Time was when the mineral substance chiefly talked about as necessary for the human body was iron, an element supposed essential to ample blood Nowadays others have joined the list, for example, the iodine now believed essential to the chemical factory in the thyroid gland That calcium is among these necessities is no news to biologists"

For the extension of this knowledge among the people physicians are grateful to the daily press

---

MIND AND DISEASE

Dr Cadman, in the New York *Tribune* of May 20, gives the following answer to the Christian Science idea that all disease is the result of mental error

"When cattle contract the 'foot and mouth disease' or your dog gets the rabies, what sinful thinking produced these maladies? You will perhaps insist that you are referring to human diseases As a matter of sober fact, disease and decay in the human body are natural products incidental to the perishable nature of man's physical organism Everything is more or less affected by them Plants are blighted by pestilences peculiar to the vegetable kingdom, and animals likewise perish from afflictions peculiar to their kind Birth, life, decay and death constitute the physical program of all visible life and everything animate has its share in it

"You say that disease will ultimately recede and vanish Then it must be a reality, just as health is a reality It takes something, not nothing, to thus dwindle and disappear Yet you would have us believe that evil is non-existent and disease or aught else detrimental mere mental fictions Experience and medical science contradict these postulates But they confirm the wisdom of not unduly dwelling on life's morbid phases It is measurably true that the less we think about disease the less we shall be troubled by it

"Although your somewhat airy philosophy does not explain the profound mysteries of evil or of physical disease and death, it stimulates that faith in the supremacy of the spiritual element which is one of humanity's largest assets It is also a valuable aid to the medical profession, especially in the treatment of patients having supersensitive temperaments The diverting of their minds from introspection and from dwelling upon their physical condition frequently results in the 'cure' of a disease which they sincerely believed they had, but which never actually existed organically"

HARNESSING SEWER GAS

The New York *Times* of May 20 has the following editorial comment on putting sewer gas to use

"In Charlotte, N C, is a power plant driven by energy obtained from the town's own sewage gas The periodical *Power* assures us that every American municipality is watching an experiment which is already so successful that sewage must be regarded as something more than a nuisance

The gas that Charlotte supplies to the engines of its power plant is generated by bacteria as they convert sewage into an odorless sludge Two months are required by the bacteria to do their work. In the process large quantities of gas rich in ethane are evolved and carefully collected

Originally the gas was used to heat water, which was passed through coils in the sludge and which enabled the bacteria to thrive in a luxurious warmth Responding to this attention, they produced more gas than the town could use for their benefit. The surplus is used in generating power, and thus an example is set to every city of America"

When someone finally harnesses sewer gas to heat houses and drive engines, the problem of sewage disposal will be solved There is no inherent reason to prevent this being done

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A section from this column will be made for review, as dictated by their merits or in the interests of our readers.

THYROXINE. By EDWARD C. KENDALL, M.S., Ph.D., D.Sc. Octavo of 265 pages, illustrated. New York, The Chemical Catalog Company, Inc., 1929. Cloth, $5.50. (American Chemical Society Monograph Series.)

TEXTBOOK OF CLINICAL NEUROLOGY. For Students and Practitioners. By M. NEUSTAEDTER, M.D. Octavo of 602 pages, illustrated. Philadelphia, F. A. Davis Company, 1929. Cloth, $6.00.

SPINAL ANESTHESIA (SUBARACHNOID RADICULAR CONDUCTION BLOCK). Principles and Technique. By CHARLES H. EVANS, M.D. Octavo of 203 pages, illustrated. New York, Paul B. Hoeber, Inc., 1929. Cloth, $5.50.

PROCEEDINGS OF THE TWENTY-SECOND ANNUAL CONVENTION OF THE ASSOCIATION OF LIFE INSURANCE PRESIDENTS. New York, N. Y., December 13 and 14, 1928. Octavo of 280 pages. Paper.

DIABETES AND ITS TREATMENT. By FREDERICK M. ALLEN, M.D. 24mo of 98 pages. New York and London, Funk & Wagnalls Company, 1928. Flexible leather, thirty cents. (The National Health Series—Edited by the National Health Council.)

CARE OF THE MOUTH AND TEETH. By HARVEY J. BURKHART, D.D.S., LL.D. 24mo of 45 pages, illustrated. New York and London, Funk & Wagnalls Company, 1928. Flexible leather, thirty cents. (The National Health Series—Edited by the National Health Council.)

WHAT EVERY ONE SHOULD KNOW ABOUT EYES. By F. PARK LEWIS, M.D., F.A.C.S. 24mo of 70 pages, illustrated. New York and London, Funk & Wagnalls Company, 1928. Flexible leather, thirty cents. (The National Health Series—Edited by the National Health Council.)

ANGINA PECTORIS. By HARLOW BROOKS, M.D. 16mo of 164 pages. New York and London, Harper & Brothers, 1929. Flexible leather, $2.50. (Harper's Medical Monographs.)

GETTING READY TO BE A MOTHER. A Little Book of Information and Advice for the Young Woman Who is Looking Forward to Motherhood. By CAROLYN CONANT VAN BLARCOM, R.N. Second Edition, revised. 12mo of 286 pages, illustrated. New York, The Macmillan Company, 1929. Cloth, $1.75.

NEUROSURGERY. Principles, Diagnosis and Treatment. By WILLIAM SHARPE, M.D., and NORMAN SHARPE, M.D. Octavo of 762 pages, illustrated. Philadelphia and London, J. B. Lippincott Company, 1928. Cloth, $11.00.

THE MEDICAL DEPARTMENT OF THE UNITED STATES ARMY IN THE WORLD WAR. Under the Direction of Major General M. W. IRELAND. Volume IV. Activities Concerning Mobilization Camps and Ports of Embarkation. By Maj. ALBERT S. BOWEN, M.C. Quarto of 494 pages. Washington, Government Printing Office, 1928.

THE DIAGNOSIS AND TREATMENT OF TROPICAL DISEASES. A Compendium of Tropical and Other Exotic Diseases. By E. R. STITT, A.B., Ph.G., M.D. Fifth Edition, revised. Octavo of 918 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, $9.00.

RECENT ADVANCES IN OBSTETRICS AND GYNAECOLOGY. By ALECK W. BOURNE, B.A., M.B., B.Ch. Second Edition. 12mo of 382 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1928. Cloth, $3.50.

HANDBOOK OF PHYSIOLOGY. By W. D. HALLIBURTON, M.D., and R. J. S. McDOWALL, M.B., D.Sc., F.R.C.P. Eighteenth Edition. Octavo of 902 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, $4.75.

PRACTICAL CLINICAL LABORATORY DIAGNOSIS. A Thoroughly Illustrated Laboratory Guide Including the Interpretation of Laboratory Findings Designed for the Use of Students and Practitioners of Medicine. By CHARLES C. BASS, M.D., and FOSTER M. JOHNS, M.D. Third Edition, revised. Octavo of 197 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1929. Cloth, $7.50.

AIDS TO PSYCHOLOGY. By JOHN H. EWEN, M.R.C.S., Eng., L.R.C.P. Lond. 16mo of 166 pages. New York, William Wood & Company, 1929. Cloth, $1.50.

THE CHILD OF CIRCUMSTANCE. The Mystery of the Unborn. By ALBERT WILSON, M.D. Octavo of 420 pages, illustrated. New York, William Wood & Company, 1929. Cloth, $6.00.

HANDBOOK OF BACTERIOLOGY FOR STUDENTS AND PRACTITIONERS OF MEDICINE. By JOSEPH W. BIGGER, M.D. Second Edition. 12mo of 452 pages, illustrated. New York, William Wood & Company, 1929. Cloth, $5.00.

ANTE-NATAL CARE. A Practical Handbook of Ante-Natal Care and of the Abnormalities Associated with Pregnancy. By W. F. T. HAULTAIN, O.B.E., M.C., M.B., and E. CHALMERS FAHMY, M.B., F.R.C.S.E. 12mo of 113 pages. New York, William Wood & Company, 1929. Cloth, $2.25.

HANDBOOK OF ANAESTHETICS. By J. STUART ROSS, M.B., Ch.B., and H. P. FAIRLIE, M.D. Third Edition. 12mo of 339 pages, illustrated. New York, William Wood & Company, 1929. Cloth, $3.25.

GLEANINGS FROM GENERAL PRACTICE. By DAVID TINDAL, M.D. 12mo of 209 pages. New York, William Wood & Company, 1929. Cloth, $2.50.

BOOK REVIEWS

LIPIODOL IN THE DIAGNOSIS OF THORACIC DISEASE. By F G CHANDLER, M A, M D, and W BURTON WOOD, M A., M D Octavo of 133 pages, illustrated New York, Oxford University Press, 1928 Cloth, $3 50 (Oxford Medical Publications)

In this little book, Chandler and Wood have turned out a very neat and highly satisfying piece of work. It may be one of limited appeal, but of very great appeal to those interested—most particularly roentgenologists and internists The authors arrive at the now generally accepted opinion, that the use of lipiodol, while exceedingly helpful in solving rare problems in pulmonary pathology, is most particularly helpful in cases of bronchiectasis, especially bronchiestasis of the left lower lobe It is these cases that have heretofore frequently eluded demonstration because of the density of the cardiac silhouette. The greater density of the shadow cast by lipiodol provides a contract media most suitable and helpful

The book is beautifully illustrated, the reproduction of the skiagrams being particularly successful A word of commendation must also be extended to the publisher, The Oxford University Press

FOSTER MURRAY

METHODS AND PROBLEMS OF MEDICAL EDUCATION (Tenth Series) Quarto of 343 pages, illustrated New York, N Y, The Rockefeller Foundation, Division of Medical Education, 1928.

The tenth series of the Rockefeller volumes on medical education is like the others, profusely illustrated It contains the usual run of articles descriptive of medical school equipment here and abroad

A very valuable article by Charles Frankenberger on "How to Use a Medical Library" deserves much more publicity than this volume is able to give it

C. A. G

SURGICAL CLINICS OF NORTH AMERICA. Vol 8, No 3, June, 1928 (Chicago Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, $16 00 net, paper, $12 00 net

Of the many interesting and important articles in this issue it is necessary to stress the timely warning of Dr A. D Bevan of the many dangers and complications of the routine gastro-enterostomy Dr Speed presents a series of cases illustrating the confusing picture of acute epiphysitis of the femur Dr Eisendrath's presentations of bladder neck operations and the causes of their failure is likewise instructive and convincing A large number of other important subjects, masterfully discussed, complete this valuable issue of the Clinics

SURGICAL CLINICS OF NORTH AMERICA. Vol 8, No 4, August, 1928 (Philadelphia Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, $16 00 net, paper, $12 00 net.

The Philadelphia issue brings us the names of Deaver, DaCosta, Babcock and many other prominent surgeons These names insure a selection and presentation of subjects such as to satisfy the most fastidious surgical taste. Among the articles deserving special mention are a summary of the present status of the surgery of the spleen, the treatment of burns, an all embracing discussion of biliary surgery and a large number of case reports bearing upon the daily work of any busy surgeon

SURGICAL CLINICS OF NORTH AMERICA. Vol 8, No 5 October, 1928. (New York Number) Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth, $16 00 net, paper, $12 00 net

The majority of articles in this number come from the pens of the several surgeons of the Fifth Avenue Hospital of New York City Here again we have a fine array of subjects, expertly treated, touching upon every conceivable aspect of surgery The admirable paper of Dr Berg of the Mount Sinai Hospital on the operative treatment of gastric and duodenal ulcers is stimulating though not entirely convincing Dr Murray contributes some valuable ideas on the treatment of certain fractures, and so on down the line one finds every surgical topic adequately discussed in this issue of the Surgical Clinics

GEO WEBB.

THE KAHN TEST A Practical Guide. By R. L KAHN, M S, Sc D Octavo of 201 pages Baltimore, The Williams & Wilkins Company, 1928 Cloth, $4 00

In this book the author gives a detailed description of the technique and clinical application of the Kahn test for syphilis While the book is intended primarily for laboratory workers yet the physician is strongly urged to acquaint himself with its contents The apparatus reagents, and performance of the test are described with great clarity and this should be of great aid to those who are depending on this test in the diagnosis of syphilis

EDWARD H NIDISH

CHEMISTRY IN MEDICINE. A Cooperative Treatise Intended to Give Examples of Progress Made in Medicine with the Aid of Chemistry Edited by JULIUS STIEGLITZ 12mo of 755 pages New York, N Y, The Chemical Foundation, Inc., 1928 Flexible leather, $2 00

This authoritative volume summarizes in a readable interesting way the dependence of medicine on chemistry Accounts are given of the most notable successes achieved through the cooperation of chemists with workers in the biological sciences Each story is told by a specialist in his field in language that a layman can follow

Among the distinguished contributors of whom there are about forty may be mentioned E. V McCollum (vitamins), John J Abel (suprarenal hormone), E. C. Kendall (thyroxin), J R Macleod (insulin), J A Wilson (sewage disposal), H Gideon Wells (immunity), and Carl Voegtlin (chemotherapy)

"Chemistry in Medicine" is not a technical book, it is a non-technical record of the achievements of mankind up to the present time in his struggle to maintain health in a frequently hostile setting The intelligent layman as well as the medical man will find this book interesting and stimulating An acquaintance with its contents is essential to an understanding of modern life and civilization—it may be recommended to non-scientific friends as a book of general cultural interest and value. A glossary of about 200 technical words is appended for the use of the general reader

The price is ridiculously low because "all of the authors of the chapters as well as all of the editors have contributed their services gratuitously" and because it is published without profit by the Chemical Foundation

M J SHEAR

INTERNATIONAL CLINICS. Edited by Henry W Cattell, A.M, M D Thirty-eighth Series, Volume III Octavo of 310 pages, with illustrations Philadelphia and London, J B Lippincott Company, 1928.

Endocrinology is well presented in this issue by Sajous Alcohol and Life Duration are discussed ably by Raymond Pearl, who also, writing as a biologist, has something of moment to say about cancer Extra-pleural thoracoplasty is dealt with by Bettman Sir Humphry Rolleston elucidates the subject of abnormal blood-pressures. As usual, this volume of International Clinics gives physician and surgeon alike much of interest and value.

J

FINAL REPORT OF THE LEAGUE OF NATIONS INTERNATIONAL COMMISSION ON HUMAN TRYPANOSOMIASIS Octavo of 392 pages, illustrated Geneva, League of Nations—Health Organization, 1928 Paper, $5 00

This report on trypanosomiasis in Africa will be the source of much valuable information to all students of the disease, whether medical or sociologic

The volume contains seven chapters devoted to a most careful detailed investigation of the etiology, pathological anatomy, serology, and epidemiology of this disease, with the final number containing the general recommendations for the control of sleeping sickness in African dependencies.

The contributors to the International Commission s investigation and publication are Professor F K. Kleine, Dr H Lyndhurst Duke, Dr G Lavier, Dr M M Prates, Major M Peruzzi, and Dr L Van Hoof Each of these prominent investigators has given much of fundamental and original value. The observations and experiments of Dr H Lyndhurst Duke on the Bionomics of the Trypanosome appear to the reviewer to merit special praise

The League of Nations is to be congratulated on the publication of such a Report as this one, and it is to be hoped that the excellent policy of appointing International Commissions for the investigation of disease will continue. No step promising more in the saving of human lives could well be taken.

JOSEPH C. REGAN

CHILD HEALTH AND CHARACTER. By ELIZABETH M SLOAN CHESSER, M.D 16mo of 204 pages New York, Oxford University Press, 1927 Cloth, $1.30

Some parts of this book have appeared in articles published in the lay press, including *The Glasgow Herald, Ladies' Home World* and *The Nursery World* The volume is small which is an advantage in the reading of it, and the material is sensibly and simply arranged. The text is a happy combination of physical and mental preventive care Adolescence and the relation of diet and sunlight to health constitute a considerable portion of the book.

WM HENRY DONNELLY

REGIONAL ANESTHESIA. Its Technic and Clinical Applications By GASTON LABAT, M D Second Edition, revised Large octavo of 567 pages, with 367 illustrations Philadelphia and London, W B Saunders Company, 1928. Cloth, $7.50

An excellent monograph by a most able author This edition, containing many more illustrations than the previous one, covers all the problems of local regional and spinal block. The form of presentation is concise, precise and attractive. The book should induce many a surgeon to abandon general narcosis in favor of the much safer and more physiological regional analgesia. The completeness of the text places the book in the reference class

GEO WEBB.

EUROPEAN CLINICS Editorial Staff of European Clinics. 1927 DR. WILLIAM LINTZ, Brooklyn, N Y, Editor-in-Chief Octavo of 347 pages, illustrated Philadelphia and London, J B *Lippincott* Company, 1928.

The volume of some 350 pages represent lectures in the various branches of medicine delivered by the clinicians of Great Britain, Norway, Sweden, Denmark, Germany and France.

A review of the lectures given by the learned lecturers would indeed be beyond the scope of the ordinary book review It is however interesting to note that Tillisch of Norway gives a detailed report on the use of sanochrisin and considers its use as a valuable aid in the treatment of *tuberculosis* Dr Lyon of London in his discussion of diabetes mellitus emphasizes the non-progressive nature of the disease and makes some very interesting observations. Sir Crisp English makes some very interesting reports on the frequency of gall stones in the well fed underworked group and relative freedom from symptoms of the great majority of these people. About 20 per cent of those over the age of 20 have or are going to have stones. He considers the risk of carcinoma of the gall bladder in stone cases scarcely enough to warrant operation and remarks that those of the profession developing stones take this viewpoint. In conclusion he urges that there be no hard and fast rule in our attitude to gall-stones Stones are very *common*, often give very little trouble, their owners are far from being ideal subjects for major surgery, so that each case must have separate consideration. If stones give rise to serious or repeated trouble, and are a definite handicap they should be dealt with and cholecystectomy is the operation of choice.

Many of the clinics are of great interest and well worth reading It is a good opportunity of keeping in contact with conservative medicine.

H M FEINBLATT

THE CORONER AND THE MEDICAL EXAMINER. By OSCAR T SCHULTZ and E M MORGAN Octavo of 101 pages Washington, D C., The National Research Council of the National Academy of Sciences, 1928 Paper, $1.50 (Forms Bulletin of the National Research Council—Number 64)

The salient features of Bulletin No 64 of the National Research Council, entitled "Coroner and Medical Examiner," are excellently summarized and commented on in the Table of Recommendations Every one of these recommendations is sound and to the point. A suggestion as to the change in title of the "Office of The Medical Examiner" may be of some use inasmuch as the term "Medical Examiner" covers such a range in medical activity as to cause some confusion and detract from the importance of the office—"Bureau of Forensic Medicine" might be a better title.

The most important point to be stressed, in the mind of the reviewer is the proper co-ordination of the various items properly coming under the jurisdiction of this office. This is referred to in Paragraph 4 of the recommendations

The monumental work of Charles Norris, Chief Medical Examiner of the City of New York, and his organization, although it has not yet attained the ideal, may serve as a pattern for such an office throughout the country

The complete jurisdiction and control of the cases, so as to prevent the destruction of evidence by the police and others usually through ignorance, so that no evidence is lost or covered up, is important. The importance of this point is so great as to emphasize the pressing necessity of complete authority and a very close co-ordination of all departments concerned.

Right Now!

Summer feeding troubles are already beginning to make an appearance. That many "problem" cases during the warm weather period are preventable, is substantiated by the experience of physicians all over the world. They prescribe Dryco because they have found that its use avoids milk-borne infections and nutritional disturbances. We believe that this milk merits your consideration in view of its consistent record of excellent results over a period of many years.

Send for suggested feeding tables, Dryco samples and clinical data

ANNUAL REPORTS

State Medical Societies generally are confronted with the problem of securing the annual reports of officers and committeemen in time for their early publication in the State Journals New Jersey, whose annual meeting is to be held June 12-15, in Atlantic City, has the problem according to the following note in the May issue of the Journal of the Medical Society of New Jersey

"At a meeting of the House of Delegates, June 11, 1927, the following resolution was adopted 'That the report of the Board of Trustees and the reports of committees which are to be acted on in the sessions of the House of Delegates, be printed in The Journal a month before the meeting in order that the delegates may be acquainted with the business that is to come before them'

"In compliance therewith, the Editor requested the officers and chairmen of standing committees to submit their reports before April 20, for publication in the May Journal The following reports include all received up to April 28"

The full report of the Committee on Insurance is as follows

Health and Accident

Number of members insured by the Health and Accident Policy	435
Number of members having claims paid	54
These claims were for amounts from $25 to $775 Total	$8,123

Automobile

Number of policies in force	84
Number of claims paid	25

These claims were for fire, theft, liability, property damage and collision, and varied from $7 60 to $1,225 Total $4,046 60

First dividends returnable to automobile policy holders (for liability and property damage) were payable December 31, and for the months of December, January, February and March have amounted to $333 81

Committee

The report of the editor calls attention to the several departments of the State Journal, as follows

'During the past four years we have gradually added and developed special departments which the Editor considered of value to readers either in the sense of entertainment or of post-graduate study These departments and the reasons for instituting them are as follows

"Ethics because there is unquestionably a need for maintenance of ethical conduct, and because the modern medical student does not seem to be so well instructed in ethical principles as was his predecessor of former times

"Economics because too little attention has been paid by the average physician to the business side of his profession, and this seemed to be the best means of attracting his attention to economic problems

"Esthetics because the busy physician, immersed in scientific and humanitarian problems and overwhelmed by the constant and insistent demands of his own profession, gives too little thought to those arts and sciences with which he should be familiar and from which he might gain some relaxation

"Collateral Reading introduced quite recently for much the same reasons as given in reference to Esthetics, and to offer reading suggestions to the physician who is too busy to keep pace with such semi-professional literature as his own patients are devouring

"The Woman's Auxiliary because that young organization needs something in the nature of a directing influence to guide its forces into harmony with those of the state society

"Lighthouse Observations because we believed that a thoughtful review of recent litarature on some particular subject each month would be preferable to abstracts selected at random and without any cohesion among those chosen

"In Lighter Vein because we hoped you would not lose sight of the fact that life itself is, at best, a joke

"We have not mentioned editorials, current events, communications, or county society reports because they are standard parts of every society journal and call for no special comment, unless it be to say that in your Journal the county society reports surpass in scientific value those of any other medical journal in this country"

"The only new suggestion the Editor has to offer, and upon this also he would like an expression of opinion, is the publication monthly of at least one editorial on scientific medicine, prefer-

ably signed articles by members of the society We have been using editorial space mainly for the business and economic affairs of the society In the April issue, we used as a signed editorial a communication on education in obstetrics written by Dr Cosgrove That gave us the notion of publishing a similar editorial monthly and we should like to know what you think of the suggestion"

Regarding broadcasting the editor reported "Radio broadcasting from Station WPG, Atlantic City, was resumed for the third consecutive year, and in the period between December 7, 1928, and April 26, 1929, our disease prevention program was put on every Friday evening at 8 30 —a total of 21 radio talks The topics presented were

Prevention of Diphtheria
Colds in the Head
Prevent the Spread of Influenza
Prevent Complications of Influenza
Present Status of Influenza Epidemic
The Clean Mouth
The Cancer Problem
Prevention of Cancer
Periodic Health Examinations
Keeping Your Teeth Clean
Nasal Sinus Disease
Weaning the Infant
Prevention of Diabetes
Prevention of Diphtheria
Prevention of Heart Disease
Is Tuberculosis Curable?
Nervous Children
Fate of the Fat
Use and Abuse of Sun Baths
Prevention of Deformities

"It has been our custom to mimeograph these talks and distribute them in advance to the newspapers of the state with a release date coinciding with the time of radio delivery Efforts have been made to ascertain what proportion of those 140 newspapers actually published this material in whole or in part, but in those efforts we have not met with much success We have received positive evidence of publication in 15 only of the 140 to whom copy was regularly sent Although there is no means of ascertaining how much benefit either the society or the public has derived from this procedure, we are inclined to doubt the advisability of its continuance in view of the fact that we have so many other demands upon the funds of the society"

Regarding Public Relations the editor reports "Public Relations Reference to the Board of Education leads us to say that the public relations of the state medical society are in excellent condition The State Board of Health, State Board of Medical Examiners, Board of Educa-

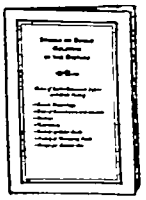
KNOX SPARKLING GELATINE IS VALUABLE IN THE DIETS OF INFANTS AND CHILDREN

WE HAVE published a booklet, "Value of Edible Gelatine in Infant and Child Feeding" It contains many valuable suggestions on the proportions and method of preparation for gelatine used in infant feeding, giving specific instances of results achieved with infants and growing children

Knox Gelatine added to the milk formula largely prevents the formation of hard curds, and so helps to correct regurgitation and vomiting It is more readily digested and absorbed Dr Downey, in his research work at Mellon Institute, determined that the addition of gelatine to the milk mixture materially increases its available nourishment

Another important use of Knox Sparkling Gelatine is in the diabetic diet. Here it serves as a carrier of concentrated foods, adds to the protein content, and gives the patient a feeling of satiety when the meal is over Dietitians use it to increase the variety of the liquid and soft diets of convalescents and invalids



Back of the manufacture of Knox Sparkling Gelatine is 41 years of experience. From raw material to the finished package every process is under constant chemical and scientific control Knox Sparkling Gelatine is a pure protein, unbleached, unflavored, free from sugar

QUALITY WITH ECONOMY

Knox Sparkling Gelatine is the highest quality for health It is a protein in its purest form, particularly suitable where carbohydrates and acids must be avoided When you purchase Knox Gelatine you not only get quality, but economy, for each package makes four different desserts or salads of six generous servings each.

Further Booklets Available

Recognized dietitians have prepared these additional booklets which explain the uses of Knox Sparkling Gelatine in various illnesses They offer a number of delicious and appetizing recipes which lend variety to the prescribed diets Data on interesting scientific tests is also available Simply check the coupon below and mail it to us

KNOX GELATINE LABORATORIES, 432 Knox Avenue, Johnstown, N Y

Please send me, without obligation or expense, the booklets which I have marked Also register my name for future reports on clinical gelatine tests as they are issued

THIS COMPLETE STERILIZER EQUIPMENT ONLY $57.50

No. T685 Cabinet with 14" Prometheus Sterilizer

Here Doctor!!

is just exactly the Sterilizer equipment that you have been looking for because it has full office efficiency in both the cabinet and the sterilizer This beautifully finished cabinet with a French glass door swinging instrument tray and a regular New Quick Boil Prometheus Sterilizer will add efficiency to your work and dignity to your office.

This new design cabinet possesses the utmost that can be secured in grace and stability It is an equipment that you will be proud of Remember you do not get a make shift sterilizer but a regular NEW QUICK BOIL PROMETHEUS

YOU SAVE $15 50

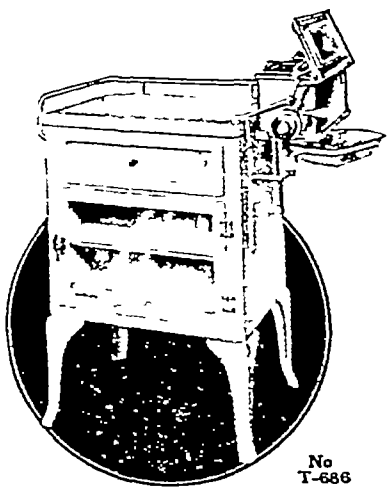
The price of the cabinet alone is $35 00 The Sterilizer alone is $38 00 so when you buy the combination for $57.50 you save $15 50

DESCRIPTION

The cabinet is 16"x20"x31" high. It is made of heavy steel construction throughout and is finished in a hard baked durable and lasting white enamel. The top is removable and is of baked porcelain with rounded corners A graceful guard rail at top protects the bottles and etc. from slipping off Instrument Tray swings forward for use and out of the way under the sterilizer when not in use. The tray is of hard baked porcelain All trimmings are highly nickel plated. Commodious storage compartment is 18" high with white enamel steel shelf Door closes snugly to protect from dust. Gracefully finished legs are rounded at bottom to protect floors.

For the doctor who wishes drawer space in which to store instruments and etc., we have designed the same cabinet except with a drawer at the top as illustrated below This cabinet is identical with the No T685 except that it has the drawer which is 14"x15"x4"

STERILIZERS We quote below varying prices for these cabinets equipped with various types of Prometheus and Castle Sterilizers The Prometheus is a standard New Quick Boil Sterilizer with three sterilizing speeds indicating switch asbestos lining and complete positive cut off The Castle is a regular full automatic control sterilizer of the latest type.



TERMS

We guarantee that you will be pleased with this equipment. If not thoroughly satisfied, you may return it and every penny will be refunded. It must please you—you are the sole judge. If you pay cash, you may deduct 5% from the prices If preferred, you may send 25% cash with order and pay balance in 6 equal monthly payments or we will ship on regular open account.

PRICES

No T685 Cabinet with 14" Prometheus Sterilizer	$57 50
No T685 Cabinet with 17" Prometheus Sterilizer	61 50
No. T685 Cabinet with 13" Castle Sterilizer	66.50
No T685 Cabinet with 16" Castle Sterilizer	70 50
No T685 Cabinet without sterilizer but with sterilizer holder attached	35 00

For cabinet No T686 with drawer add $4 00 to the above price.
Any above sterilizers chromium plated, add $10 00 extra

The
"Pomeroy"
Supporting Corset

A good corset, properly made and fitted, not only gives needed support to the vital organs, but moulds the figure to correct and graceful lines

The Pomeroy is ideal for this purpose, for it is so designed that the uplift is given by the corset itself with no need for additional belt or other contrivances The intersecting laces give an extra upward and backward lift which further helps the muscles of the abdomen to give the necessary support

METHODS OF POST-GRADUATE EDUCATION

The University of Kansas offers extension courses in medicine as it does in other departments of learning Commenting on postgraduate medical courses the May *Journal of the Kansas Medical Society* says

"The development and adequate instruction in medicine for postgraduates is much more difficult and complex than in the more academic fields The problems arising from such courses are far more difficult to surmount than those involving undergraduate medical instruction. The students are much more critical, the amount of clinical material needed is much more extensive and varied, and complications both economic and professional are very apt to arise and lead to adverse criticism of the work done

"This attempt of universities to enter into postgraduate medical instruction is largely in the experimental state and mistakes are apt to occur Various types of courses are offered Some schools give a graded, carefully supervised course of one to three years, adaptable to only a chosen few, who are usually specialists Such a course is manifestly impractical for the great bulk of practitioners

"Other schools offer circuit courses which bring the instructors directly to the home of the doctor and relieve him of the necessity of leaving his patients while he is getting this instruction In Kansas this was carried out recently in one specialty and in less than a year's time almost twenty-five per cent of the practitioners of the state had enrolled in this course with almost universal enthusiasm over the results obtained The trouble with this system is the scarcity of real, genuine clinical teachers, who have the inclination and can afford to sacrifice their own practice to give this instruction. For this reason further courses of this type had to be at least temporarily discontinued

"Short intensive courses in various specialties have been offered in the medical school with varying success Such courses are given by men of unquestioned professional standing and of exceptional teaching ability These courses have also given general satisfaction but reach relatively few physicians Here again suitable instructors are scarce

"Another method that has been used is a week of intensive clinics given in the medical school during the vacation period This has certain advantages but manifestly is suitable only to a relatively small number of physicians The opening of the facilities of the school to a relatively small number of practitioners who attend the clinics and classes of the undergraduate students has been tried, and one man in particular, after being here a month, could not say enough about the

A STATE MEDICAL LIBRARY

A bill for the establishment of a State Medical Library has been introduced in the California Legislature Concerning it the May issue of *California and Western Medicine* says

"This bill, which if enacted, could in years to come be made to be of untold service to the medical profession of California, is having a somewhat tardy progress Just why, is as yet not altogether plain It is a measure to which the California Medical Association, through its officers, has committed itself The California Board of Medical Examiners cannot well use, and what is quite as important, the state department of finance will not allocate to the examining board a budget permitting the utilization of all the monies in the reserve fund of the California Board of Medical Examiners These monies coming from doctors, must not and shall not be diverted into the general state fund for upkeep of roads, prisons, and so on, without vigorous objection and indignation from the medical profession On that point there need be no doubt

"As this is written, the latest proposal to jeopardize the measure comes from obscure sources It is probably an expression of the well-known procedure of smothering a bill by means of amendments In this instance, it comes forth as a naive proposition to divide the $100,000 between two of the medical schools of California for their libraries, because then the books and journals would be made more available to a larger number of student readers!

"This proposed state medical library can amply serve the medical institutions of California, but such service will be best performed through faculty library committees in touch with the state librarian's office, and with equal recognition of every medical school in the state

"In similar manner this proposed state medical library can serve hospital staffs and county medical societies of California by supplying chart and other exhibits and special literature for programs which could be arranged in advance. If a systematic and rotating so-called postgraduate course of lectures such as was promoted by the American Medical Association several years ago, were outlined in connection with the extension lecture work of the California Medical Association, it is quite understandable how a traveling set of excellent charts and so on, could be of very great service in adding to the interest and value

Summer Problem No. 1—CONSTIPATION

AGAROL is the original mineral oil—agar agar emulsion with phenolphthalein and has these special advantages.
Perfectly homogenized and stable· pleasant taste without artificial flavoring, freedom from sugar alkalies and alcohol no contraindications· no oil leakage· no griping or pain no nausea or gastric disturbances not habit forming.

The greater loss of water from the body in hot weather due to perspiration is seldom replaced Some habits do not change with the season Constipation is the inevitable result Chronic cases become aggravated.

The cathartic habit is easily established, unless you prescribe

AGAROL

the original mineral oil and agar-agar emulsion with phenolphthalein It is not heating, it is palatable, and no alkali, alcohol or sugar is present to interfere with digestion.

value of the experience he acquired while mixing with the other students

"Some postgraduate instruction is being offered by the medical profession itself, either under the auspices of the state medical society or some other recognized medical organization Whether such courses are better adapted to the general practitioner and have advantages over those offered by the extension divisions and medical schools of the country remains to be seen."

THE WASHOE COUNTY SOCIETY, NEVADA

The May issue of *California and Western Medicine* describes a meeting of the Washoe County Medical Society, Nevada, as follows

"The regular April meeting of the Washoe County Medical Society was held at the home of Doctor Morrison on the evening of April 9 About thirty members and visiting physicians were present The scientific papers arranged as a symposium on the main topic of 'Better Obstetrics' Five papers were presented

"The paper on 'Is the Present Increase of Cesarean Sections Justified?' by Doctor Da Costa was interesting in the particular parallel by citing the birth statistics of the city of Pasadena for the year 1924 as given in the *American Journal of Obstetrics and Gynecology,* December, 1924, by Doctor Hibben, with the birth record of the entire state of Nevada for 1928 Pasadena had in 1924 a birth record of 1414 cases, with about 70,000 population In this number there were thirty one Cesarean sections done, with a mortality of one death Of the total of the 1414 cases in Pasadena there were 862 cases delivered in the hospital The remainder in their homes In Nevada, for 1928, there were 1309 births Of this number for 1928 there were seventy-two births in the St Mary's Hospital in Reno with ten Cesarean sections The number of deaths following Cesarean sections in Reno could not be ascertained, but the deaths for childbirth in all cases in Nevada were recorded as six The population of Pasadena in 1924 and Nevada in 1928 was about equal The essayist was very positive in declaring that ten Cesarean sections in seventy-two hospitalized births in Reno was, in his opinion, an unusual percentage, and indicated a catering to the spectacular and the commercial

"It was interesting to note that, in point of attendance, one physician came a distance of about 350 miles Another about 300 miles Another nearly 100 miles One doctor drove over a 6250-foot pass at night Two others, 60 miles When one considers that at the time there was a severe spell of snowy weather, it shows an interest in medical affairs Let the eastern brothers who might consider ten miles a good drive, consider these distances"

(Continued from page 724—adv xxiv)

medical organizations—national, state, and county societies— is a little like citizenship in a country

"The organization gives him a more stable position in society than he would have solely as an individual It increases the dignity of the profession It helps to maintain the standards of professional ethics and acts as a stabilizing influence to prevent the loss of professional equilibrium

"It upholds standards of education, and has had a vital influence in the education of most of the physicians in practice today

"It helps to prevent unfair competition, to eliminate unfair practices, and provides a clearing house through which the common problems of all physicians may be considered and judged

"It provides a means through which the public and the profession can be brought together, and helps to bring about a better understanding of medical problems and the medical man's point of view on the part of the general public which forms the doctor's clientele

"It protects the profession from unjust criticism, provides the machinery for investigation of differences, both individual and general, and acts as the advocate for each and every member in a way which that member can fully appreciate only if he gets close enough to the inside workings of the organization to see the wheels go round

"Organized medicine helps to adjudge the value of new discoveries It provides the machinery for testing out the truth of claim made by their originators, and so saves the individual physician from the necessity of personal experimentation

"Organized medicine helps to distribute instructions as to the proper method of application In this way the greatest number of individual physicians have the good of the discovery with the least work and risk And this sifting of the wheat from the chaff applies to nearly every one of the modern methods of diagnosis and therapy Yet so unobtrusively is the work done that the average physician is scarcely aware of this service of his organization

"Another most important aspect of the associated work is in cooperating with the government If it chooses to exert its influence, the medical organization can prevent or secure the legislation it will In Pennsylvania, at least the organization is consulted by those administrative and executive branches of the State Government which have to do with matters in which the medical profession is interested."

SALT LAKE COUNTY SOCIETY, UTAH

The question of medical publicity in the newspapers came up in the meeting of the Salt Lake County Medical Society, Utah according to the May issue of *California and Western Medicine* which says

of hospital staff and component society scientific meetings But, above all else, this proposed state medical library, as one of the activities of California, would make it possible for every physician to call upon it without any hesitancy whatever to aid him in getting a better grasp on any literature or subject in which he was interested The arguments for this state medical library are all in its favor The bill should and will go on to passage unless narrow or similar vision and activity complicate the situation, and in such event, the readers of this JOURNAL will be told the facts"

BENEFITS OF THE COUNTY MEDICAL SOCIETY

An excellent statement of the benefits of a County Medical Society is that contained in an editorial in the May issue of the *Pennsylvania Medical Journal*, which says

"For the man who lives perhaps in a remote section of the country far from the centers of population where most of the meetings are held and who can seldom attend a meeting, it is not so easy to advance concrete reasons why he should retain his membership He is not apt to have a malpractice case in which he needs the assistance of the medical defense fund He is not likely to come to want, and require help from the Medical Benevolence Fund It is difficult for him to attend meetings, so he does not secure the fellowship for which he craves nor the postgraduate value of scientific instruction It seems to him that he is not getting the worth of his money, and perhaps he is not in the tangible things on which he can put his hand, but there are other standards by which he should judge the value of his membership

"First of all, there is the sense of belonging That alone is worth a great deal

"Membership in the organization is an endorsement that may mean more than the individual member realizes For example, there is an insurance inspector who regularly visits the Journal office to look up the records of physicians who have applied for insurance Membership is one point in the applicant's favor

"Again, when the doctor travels, his membership card will gain him acceptance with other doctors and their organizations which would be much harder to obtain without that passport.

"It helps to obtain membership in other organizations of business and professional people The medical profession is represented in all the service clubs—the Rotary, the Kiwanis, the Lions—all the multiplicity of lay organizations in which membership is greatly prized by many people.

"Membership in the American network of

(*Continued on page 725—adv xxv*)

(*Continued from page 726—adv xxvi*)

r hand the medical profession must continue row more and more dependent upon the medi- school Scientific medicine is developing so dly and along such widely diverging lines that individual effort will suffice to keep in touch ı the outposts of advanced knowledge In as in other states it will devolve upon the lical schools to serve as supply stations or ring houses, where the results of clinical and oratory research will be assembled, classified arranged for practical application The serv- of a medical school has only begun with the ning of students and in the future that will only an incidental part of its function"

THE RINGWORM PROBLEM

t is somewhat surprising to doctors of New rk State to read an editorial in the May issue the *Journal of the Missouri State Medical sociation* on the widespread infection with gworm which seems to prevail in the middle st. The *Journal* says

'Dermatologists throughout the country are are of an enormous increase in the number of es of fungus infections coming to their atten- ı Many claim that almost one-fourth of their ictice, especially in the summer months, con- s of the various types of ringworm, especially t type due to the Epidermophyton Ringworm the hands and feet, which paraded in the past der such homely names as eczema, chafe, and itch, is now one of the commonest, most im- rtant and obstinate conditions in dermatologi- practice At the present time clinicians and oratory workers in our large medical centers e engaged in finding a successful physical, emical, or biological cure for these minor but distressing conditions

"Attention is also called to the importance of early diagnosis in favus, a serious fungus infec- tion caused by the Achorion schöenleinii This disease causes permanent atrophy and alopecia It has been very stubborn to treatment in the past, but with *x*-ray epilation the prognosis is more optimistic. Fortunately, the disease is rare in this part of the country The ordinary types of ringworm seen in children are always with us and are easily cured by parasitical treatment

"The large increase in the number of cases of ringworm infection is not only due to more accu- racy in clinical and laboratory diagnosis, but to the fact that lately the public has taken a greater interest in recreational facilities, bringing them in closer contact in gymnasiums, swimming pools, and recreational centers, all important sources of infection."

Stimula
in the Summer

Like a sensible man this summer you are going to take plenty of outdoor exercise for your health's sake Golf, swimming, hiking, a fishing trip, or whatever activity suits you best

But the less active days of winter are going to tell on your muscles, and you can anticipate the aches and pains when you bring them into play

Now here's a little product that will help that—Stimula—an ingenious analgesic balm with an Irish moss base Absorbed in a jiffy and when it sinks in, it helps relieve aching muscles

Stimula contains camphor, capsicum, menthol, and methyl-salicylate, and the Irish moss base makes it different and more effective

May we send you a tube of Stimula with our wishes for an enjoyable vacation? Put it in the golf club locker or tuck it away in the traveling bag You will find a use for it.

The E. L. Patch Company
Boston, Mass

"W A Pettit read a paper upon 'The Prese Epidemic of Meningitis' M M Nielson su gested that the substance of W A Pettit's r port be given to the Salt Lake City newspape W A Pettit stated that this has been unsucce fully attempted from time to time, and that r cently four of the city newspapers were offer a bulletin and only one newspaper published t report. T B Beatty stated that he had offered bulletin to one of the newspapers setting for the exact condition of the meningitis epidem giving answer to numerous questions asked, t number of cases in town at the resent time, a offering proper advice regarding certain proph lactic measures, and that this paper refused print all of this bulletin, refused to print it exce as inconspicuously as possible on an inside pag and when an offer was made to pay for the prin ing of this article at usual advertising rates was refused Sol Kahn moved that this socie go on record commending the City and Sta Board of Health in their stands taken in the pre ent epidemic, and that it does not believe that th schools should be closed at the present time b cause of this This motion was seconded an carried

"Mr Lund, speaking for some visiting men bers of the Pharmacal Association, stated that h thought this society should be commended fc their stand in the present meningitis epidemi and that something ought to be done to correc the attitude taken by the newspapers"

THE MEDICAL SCHOOL AND THI PRACTICING PHYSICIAN

The May issue of the *Journal of the Kansa Medical Society* is called the medical school num ber for all its scientific articles are contributed by members of the faculty of the Medical School o Kansas University The *Journal* says editorially

"Every member of the Society should fully appreciate the fact that there is an intimate rela tionship between the medical school and the medi cal profession of the state, and particularly be tween the medical school and the Kansas Medica Society

"It is inevitable that the medical school shall play an increasingly important part in the prog ress of medicine in this state With the increas ing number of its alumni its influence in medical affairs must be more and more pronounced In its early history the school was largely depend ent upon the medical profession for the political influence and support required to secure neces sary appropriations and is still to some extent so dependent But it is now recognized as one of the state's most important institutions which the legislature dare not fail to provide for On the

NEW YORK STATE JOURNAL of MEDICINE

PUBLISHED BY THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Vol 29, No 12 | NEW YORK, N Y | June 15, 1929

THE RECIPROCAL OBLIGATIONS OF THE PUBLIC AND THE MEDICAL PROFESSION

HARRY R TRICK, M D, BUFFALO, N Y

The President's address at the annual meeting of the Medical Society of the State of New York at Utica, June 4 1929

IF WE should study our daily activities closely, we would find that each day is made up of a series of compromises, of give and take, of rendering assistance to some and accepting help from others

Our simplest acts are reflected on others, and by them are reflected again The fulfillment of our desires and ambitions is dependent on others, and together we work out our salvation

This inter-relation and inter-dependence of individuals, of groups, of governments, and of nations, is gradually becoming much better understood and appreciated

"Man can not live for himself alone," and "We *are* our brother's keeper"

The degree to which these maxims are applied is an index of our civilization We have come quite a long way toward the goal of perfection when we are able to recognize the worth of these precepts and their practical usefulness in our daily life, and we should take some comfort in the thought although some cynic has said "Why worry about civilization before it has arrived"

Of all the factors that have influenced the progress of the human race, the health of the people has been the most essential Disease and Death, in epidemic form (or War), have always been followed by a period of physical and moral decay

The rise and the fall of empires have been determined by the health of the people concerned, and the state of their health has indicated the character of the medical practice of the period

The practice of medicine therefore, becomes something more than a vocation It is so intimately identified with the hopes and the aspirations and the general betterment of mankind, that those who enter into it assume an obligation to Society whether they realize it or not, and by the same token every physician who earnestly endeavors to cure disease, relieve distress, and by precept and practice tries to prevent disease, without thought of self, is meeting that obligation whether he realizes it or not

Many a physician has laid down his life in line of duty No act of man is more glorious than that, but he who practices medicine for the acquisition of wealth misses the Spirit of Medicine entirely, and commits a crime against the Society he is supposed to serve

The practice of medicine and the progress of the human race are correlative

The ancient practice of medicine had to do largely with mysticism and religious rites directed toward appeasing the wrath of some deity In fact for hundreds of years the teaching and the practice of medicine rested in the priesthood Their treatment was necessarily empiric, symptomatic, palliative, sometimes curative, but people had no conception of the real cause of disease, and the state of health of a community was largely a matter of luck

In the time of the Pharaohs the Egyptians had attained to a high degree of civilization They understood the value of sanitation and hygiene They had good water supplies and sewage systems, and they practiced a sanitary disposal of their dead, but their civilization was debased morally and physically by repeated epidemics of plague, pestilence, and famine

Moses recognized the situation, and he led his people out, but even Moses had to make his sanitary code into a religious law in order to have it obeyed

The Greeks were undermined by malaria apparently brought from Northern Africa, long before the Slavs and the Turks attacked them

The Romans were decimated by the disease brought back to them by their victorious ar-

clusion, we see a people overburdened with so many regulations, not laws, but having the effect of laws, as to negate the original purport of the law under consideration Then it leads to the ultimate economic problem of a people being policed by salaried individuals to the degree that few are the workers who must produce the funds or the living for the many non-creative ones

Lay Groups Lay agencies have sprung up in the past through the neglect of the State in its

James N Vander Veer, M.D., President, Medical Society of the State of New York

governmental capacity, or because of inertia of professional bodies to formulate proper plans for keeping step with the evolution progressing around them Conceived by well minded individuals, charitable in thought, idealistic in mind, and with the best of intentions, these bodies in many hamlets, towns, cities and even larger governmental units, have been organized for the purpose of forwarding the health programs of the community, and because of recognition being denied them at first as representative of any branch of the government for the forwarding of their own local ideals, they have turned to their local citizens for the economic support of the small group

Gradually, as *major questions* have touched upon their local territory, they have been brought into cooperation with adjacent groups, until we see state-wide organizations existing, some of which are powerful enough to dictate governmental policy directly through combination of their local legislative representatives, and thus ignore the proper channels of association and deliberation with the proper State body and other bodies co-equally interested in like movements

And how often do we find on perusing the yearly reports of a lay organization that much of the funds have been expended "in organization work, or in extending work through paid leaders," while but a very small percentage of the funds raised have actually been used to alleviate the suffering as contemplated!

Lay agencies have a place in health movements up to the point of dictating policies to the State or its agents, but here their function should cease

Should the State be in a position where it cannot raise funds for maintaining its plans, lay agencies again have a place, for the good of the whole body, in soliciting funds under the proper guardianship of the State for expenditure, from those citizens who wish to aid humanity beyond the ordinary burdens placed upon them as individuals of the State But the expenditure of such funds, so raised, from gifts, endowments, from dues or public solicitation for a worthy object, should be under the direct supervision of the State through bodies duly created therefore and with accredited representatives from each group interested

Lay agencies therefore should be to help in the raising of voluntary contributions where the State cannot see its way clear to taxing its citizens for experimental work in various fields, or in times of disaster to place certain economic resources quickly in the hands of the State for the relief of human suffering, for collecting expensive statistics for temporary or permanent use, only where such cannot be done by the State, but should be done under open and direct State supervision, and for constructive work through and with coordinate bodies, who may in effort furnish the equivalent of funds so raised

Physicians The third group concerned in the solution of public health is that of the physicians, organized in their various societies in city, county, or state Upon them is usually laid the burden of carrying out the actual manual labor in the majority of movements so organized whether they be small or large. It is the doctor who must keep in touch with the individual citizen and give the actual treatment required If such a mandate as promulgated by the State is unwittingly forgotten, he it is who suffers the chastisement, through the police power of the State

mies and their captives before the Northern hordes had even thought of conquest

The history of the Middle Ages is a record of repeated ravaging of Europe by epidemic diseases

And so on down even to modern times

The tale is not a pleasant one, but it shows over and over again what isolation and a little knowledge can do The ancient civilizations were always purely local, each one "An oasis in the desert of Ignorance"

But the other side of the picture is much pleasanter

With the increase of knowledge and its greater dissemination what had previously been accepted as The Law, either civil or religious regarding health, was adopted as a desirable custom, but no intelligent attack on disease was made until the work of Pasteur and Koch and Lister and many, many others demonstrated what was the cause of disease, where its strongholds are, and how it may be successfully attacked and destroyed

The battle is on

For many years the medical profession was charged with the responsibility of combating disease when found, and of devising ways to prevent disease from attacking us The responsibility was too great and unfair The fight against disease is every man's fight, and every man should help It needs the co-operation and co-ordination of all the forces at our command—the government, the scientists, the lawyers, the clergy and the lay organizations All must do their bit

It is an obligation of the medical profession to the public to keep informed regarding disease, and to advise with the various groups regarding their part in the fight

Since the health of the people is so essential to the permanence of a nation, the conservation of the health of the people becomes a primary function of government, and it would seem that a work of this sort that is second to none in importance to the Federal Government, would require a Secretary of Health in the Cabinet of the President in order to reach its full fruition

Much has already been accomplished, but a great deal more remains to be done, and it will demand the sincerest effort and the heartiest co-operation of all the forces just mentioned to accomplish the result

Disease is the measure of our inefficiency, and is a challenge to our unity and unanimity There is no place for doubt or skepticism or cynicism in this plan for universal health, because as President Coolidge once said

"Doubters do not achieve,"
"Skeptics do not contribute,"
"Cynics do not create"

THE EVOLUTION OF A HEALTH PROGRAM

By JAMES N VANDER VEER, M.D, ALBANY, N Y

Abstract of an address by the incoming President of the Medical Society of the State of New York, at the annual meeting on the evening of Tuesday, June 4, 1929 at Utica N Y

THREE AGENCIES are involved in public health work, first, the State, second, lay groups, and third, the medical profession

The State The function of the State is to raise funds by taxation, to pay for the preservation, care, and treatment of its wards,—ourselves the citizens,—who at first are the contributors to the funds raised in varying proportions and continuing as such through successive years

If, however, the State should squander the funds so raised and allocated to public health, its citizens would then suffer twofold in their money having been dissipated, and without gaining the expected protection This is occasionally seen in a governing body overloading its administrative forces with salaried individuals At times, as in all business affairs, a department may get out of hand of an administrator, through indolence on his part or through misinformation, or lack of information transmitted upward to him

A good administrator is much to be prized in the ever-increasing complexities of our present day life

Social aspects also enter, as can be pointed out in the present handling of the question of venereal diseases Undoubtedly from a social standpoint there are grave objections to segregating the venereally infected and keeping them under strict surveillance till they are well This control can be done only through initiation of a careful program of education by an authoritative body such as the Health Department of a unit of the State, or by a unit body of the medical profession which presumably has the basic facts at its command through their individual practices The ultimate result must be cooperation, bringing into the effort such other bodies or groups, of lay or other peoples, from whom benefit for the movement can be obtained

Again, in the exercise of its function the State must have certain police powers to enforce its mandates, usually through laws but also by department regulations as broad as are the laws themselves, and curtailing more and more the individual action of its citizens, subject to the supposed good of the whole body politic When such action is carried through to an ultimate con-

tor to give of his medical knowledge, free gratis

The needy patient, sick at home, needs a physician, nurses, medicines, perhaps equipment, etc. For these, endowments should be made and placed under the directorship of persons willing to spend the income and principal as necessary to bring these comforts to people in their homes where they have one In fact, where there are large hospitals, the staff internes and nurses might be paid from such a general community endowment and the individual physician also, in making calls upon such patients

Health Demonstrations are but sporadic attempts at such help, and usually end in making the invalid seek a group clinic, or they employ outside physicians to carry on the demonstration This is not sound policy for the community, for when the demonstration ceases, it has left the community flat, to again depend on its local physicians, now deprived of outside finances, and who themselves must now go and plead for the money to carry on, since many of the former health demonstration patients have been pauperized to seek the former salaried physicians at a less fee than the local physicians could give and still maintain a living scale, and so these patients are taught to evade paying for a doctor's time at full rate, and the community begins to berate the doctor for his seeming uncharitableness

This is again seen in "visiting nurses," part time physicians attached to charitable and semi-charitable groups, compensation groupings, health physicians and medical advisors of Industrial Insurance Companies, who work on a part time salary and compete with the individual physician the rest of the day

Mr Rosenwald is right in his newer attitude of wishing to see endowments limited to short periods of time and the spending of principal run along with the spending of interest Those who would endow some object can do no better than to give of their money to the care of the sick, to be expended entirely through a reasonable time period. He says, "I am convinced that the timidity of trustees themselves is often responsible for their inability to spend a principal"

How often does a physician see a poor but worthy patient, to whom he is giving free medical attention, who could be aided if the physician but had some fund or endowment to which he might appeal quietly? And how often should he be remunerated by the community, instead of his being the sole charity contributor?

Instances are many in every community where some new semi-medical help for the sick and ailing is constantly being organized by well meaning individuals who seek financial subscription from the physician as well as layman. And then, when the new orphan asylum, hospital, welfare station or like is organized the doctor is besought once more to give his services free, unthinkingly being asked to give of his time, which is part of his capital investment to be turned into permanent investment through earnings, without one cent of recompense

What a criticism would be voiced against that physician who would offer to give so many hours per year at such a valuation per hour, as his subscription to the worthy charity which seeks his services for nothing! In many instances his subscription would far exceed the actual cash given by the greatest contributor in that section, and yet how often has it been that the wealthy citizen and large giver of the community receives praise for his generosity and the doctor is never mentioned in a dollars and cents ratio for what he has done?

Charity on the part of a physician is not the giving of professional services to a group of lay directors, or to their wards That is economic pauperizing of the physician, where others are paid for services and he is not A hospital should pay its physicians for attendance upon its ward charity patients and such payments should be a proper charge upon the community This may give one a shudder, but should so be

The same may be said of the clinic and out-patient department, and we should abandon the old time thought that the doctor owes "certain obligations" to the poor of the community, and rather implant the idea of the employment of physicians, and not by asking the physicians to be the only one to give free service, and that the cost of his work should be an equal tax in the budget of the community for which the doctor also pays his equal and just share in dollars and cents, and thus the doctor of the community, who must pay his share to support the visiting nurses, the school nurses, etc, would himself be relieved by his services to the indigent, of being doubly assessed

Or in contrast—the physician should not be asked to support, from his pocket, all of the charitable demands made upon him as the first one to be called upon by the paid solicitor, volunteer, or paid worker of the community chest

Not so long ago I came in contact with an interesting physician He was country born, highly educated and had a large city practice He told me that for the year 1924 he had kept two ledgers, the one of his entire business in which his professional services were recorded in dollars and cents In this ledger he had recorded his work done in the hospitals and clinics and in his offices, and had charged each patient as if he expected to be paid in full for all of his services Naturally his work on the charity wards of the hospital and his clinic patients and personal charity work in his offices he could not hope to collect for He had made a fee schedule for himself of every type of work done and so had computed his presumed income for the year Some of his charges made for the charity group were as follows

Many physicians are unwilling to undertake the burden of carrying out a health program as an individual through fear of making error Here, when the state finds it off unable to obtain the service of the professional group, it may come to be enrolled in its movement the services of groups less thoroughly trained in the required work at the start, but which groups may be educated slowly to take up such work and carry it forward satisfactorily and many times with greater economy to the citizens This then brings the state in active competition with its own, which it has educated or licensed to do this work, by replacing one group with another, though at first of inferior quality This is an economic law which cannot be offset

We find in the society of this health evolution two main groups of physicians, and also a liaison group. The first group are those full time salaried physicians, as health officers of the State, of districts, of counties and of towns, full time medical officers of factory groups, insurance companies, teachers, hospital superintendents, and interns

The liaison group is composed of the part time physician, who for remuneration spends an allotted time in the work undertaken and the balance of his time is devoted to private practice, usually with the hope of either becoming a full time physician, commercially or in his own practice

The third group is of that larger body of physicians carrying on their private practices under the ethics of the profession. There is so much today to divert a physician's mind from his work in his chosen field that it is small wonder he finds time to enter into newer efforts for mass preservation of the public health, and to enter organized groups of medicine and lay people formed to forestall disaster for the individual, and, perhaps to aid the general medical practitioner in his work

More and more we see delegated to less educated groups the carrying out of the mechanical efforts of medicine to prevent or to cure disease, such as school nurse inspection, and health nurse follow up work; establishing of health groups in large manufacturing plants, presided over and directed by perhaps a single physician who sees but a small percentage of the sickness among the employees after a diagnosis has been made, and where the treatment of rest and careful hygiene in all its aspects is followed to completion through the health nurse of the factory unit She it is who may, and many times does, assume more and more responsibility in the home guidance of the case as the physician becomes more and more of a desk director and less and less of an actual practitioner. And in some instances goes far beyond her province in [illegible] advised treatment

Studies as to whether a group of physicians cannot combine in a small town in such a professional manner that reduplication of effort along the road may be overcome, and that people may learn to depend on him whose "drive" is in their direction for that day, might be undertaken in some hamlet where three or four physicians are on amicable terms, and thus attempt to educate that group of townspeople in a better delivery of medical attention than they formerly had.

Perhaps the economic pressure is too great upon the rural dweller to advance the idea of his giving monetary support or by taxation to a small sanitarium in his village where emergency life saving and minor medical work could be done quite satisfactorily, and to which, each day, or each week visits could be made by a group of paid consultants as were needed to see such patients as were there, if consultation were necessary While such attempts have been made in the past of establishing sanatoria in districts for better care of the inhabitants, physicians of individualistic type have frowned upon them, mainly because of the manner in which the government of such institutions was to be carried out.

Julius Rosenwald, the Chicago philanthropist, has just given forth in clear terms his position as regards his view of vast endowments such as are being created by wealthy laymen for the benefit of philanthropies In the *Atlantic Monthly* for May, 1929, he describes the tying up forever of sums of money, in which only the income may be used to further the ideas of the donors, and quotes instances of what has happened in the British Empire, where courts have been called upon to reconstrue the terms of endowments now unable to function because of their objects having ceased to exist, and yet being controlled by "The Dead Hand in Philanthropy," as James C Young has so recently named it

It is with these endowments that touch upon the guise of medical charity that the medical profession takes issue, where the income, or gifts in money, is used to enter into the furnishing of free medical assistance to humanity individually, where such individual has not been carefully weighed in the scale of economics, and determination has not been made that he or she is not imposing on the economics of the community and especially depriving the physician of his just due, and where such an endowment is contemplated, too often is it found that the preliminary investigation as to whether such is needed has been overlooked

The physician asks only that he be assisted in caring for the sick by such philanthropies furnishing sick bed comforts for patients when ill, and in telling the world that the actual brain work of bringing the patient through to good health was not the result solely and alone because of a certain philanthropy which provided the money for the creature comforts and besought the doc-

out" their indigents to an institution to be cared for at less than actual cost, leaving the balance to be raised from the charitably inclined

That there is help coming to the medical profession to offset this economic pressure, is to be evidenced in our New York State Compensation Law for injured and sick workmen This is a step in the right direction but needs more changes now and should be revised just as often for the physicians' needs as for the workman To this I am sure the workman and the higher class of manufacturers will agree The physician thereunder should be paid his proper fee, by the carriers

Again it is seen in our school law in State Aid to counties for physically handicapped children as recently put forth in a declaration by the representatives of the Health Department, and the Department of Education of our State, and which is a beginning of a working basis whereby such cases shall not in future be placed in our hospital charity wards and tended as charity patients by physicians In a recent declaration by Commissioner Shirley W Wynne, of the Department of Health of the City of New York, he says regarding the campaign in that city against diphtheria, "I decided that as a Health Department we would carry on an educational campaign directing people to private doctors to overcome the ethical prohibition against a doctor beckoning to practice", a few hospitals and charitable institutions have placed the members of their staffs on a salary, or fee basis, and some cities raise the salaries of their medical city employees sufficiently to put them on a full basis and so close the semi-subsidized aspect of such employees entering into economic competition with physicians in private practice who can only "beckon patients to their practice" by word of mouth of their patients in which good works have been done

The medical men must meet among themselves the internal question of fees, for that will ever be present, and facilities must be provided for the human being to receive the best than can be afforded in order that health and a longer life can be vouchsafed to each individual

In a recent article in the *Boston Post,* Dr Hugh Cabot, Dean of the Medical College of Ann Arbor, says, "The physician is losing his professional or private practice identity All the great corporations are now employing very competent medical departments to look after their entire personnel" That such is the case may be true, but thereby a great percentage of the work which was heretofore a charity burden on physician and hospital in a community has been shifted to the proper shoulders, in that a business now must maintain its share of health work, and in so doing has learned that many hours of illness or injury can be salvaged and put back into productiveness through careful medical liaison, to the betterment of the business, the employer, employee and consumer

One author has, however, sounded a note of warning in answer to Dr Cabot though written before his article

"Any schemes which result in the reduction of the income of the physician and of his initiative and interest in his work, with the resultant destruction of his efficiency, is certain to result in injury to the health of the public

"The present hospital and clinic system is undermining the very existence of the private physician, and is, consequently damaging in the extreme to the interests of public health

"The cost of pay clinics is mounting higher, at the expense of the time of the group of physicians who work in such clinics, by reason of certain lay persons, who seek these clinics *at a present cost* of less than individual consultation" There is also the rising cost in more accurate diagnosis, to diversified and duplicated work due to social service workers, records to be kept, equipment required and to be maintained, and to specialization

These questions as raised for your consideration tonight have been present for long in the group of the medical profession, but are becoming more and more acute as the world moves on in its evolution, and it is for us who are gathered here tonight to carefully weigh the trend of this evolution and plan to meet the encroachment and burden settling down upon the individuality of the physician and his gradual elimination as such through economic conditions

Hernia	$50 00
Appendectomy	50 00
Laparatomy	100 00
Breast amputations	75 00
Amputation of leg, lower	50 00
Amputation of leg, through thigh	75 00
Amputation of leg, through hip	125 00
Charge to patient in clinic per visit	1 00
His usual office examination	10 00 to 25 00
His usual office call	3 00

In actual dollars and cents his books showed a business done of some $52,645 00 Of this sum well over $20,000 was charged up to the strictly charity group from which he expected no remuneration Some of this work had been done in emergencies and disasters which befell the community, but none of this $20,000 was "legitimately" collectible by him under present ethical standards and had been furnished in part to such groups as—A Boy Scout Camp in which he was interested, $128 for sick scouts during the summer season where it was advertised that parents need not fear to send their sons, as a "competent physician was provided by the camp at no expense to the parents" His two clinic days per week, 96 in all for the year, averaged 38 patients per day for which he had credited himself at $1 00 per patient, $3,648, and yet there was no social service nurse to check those who sought his advice He had been asked special advice concerning many civic affairs, where architects and other technical advisors as well as the clerks and stenographers had all received pay for services rendered per hour or per diem, of over 300 hours in the year For this he had credited himself at $10 per hour, and in one of the conferences his ideas had maintained where he had saved the project some $15,000 by his after study work at home in his "leisure" evening hours and where a high priced out of town consulting architect received $100 per day for his services He had done on his hospital wards some 280 operations in the year for which he took credit of $14,000, at an average of $50 00 per operation and attendance

And beside that at a fee of $3 00 for an office call he credited himself with 462 office calls, mostly emergencies or patients sent in by "kind friends" requesting he remember the patient was poor, or for a street accident, etc, making again $1,386, thus giving the community service for which he received nothing

All of these sums amounted to $22,162 roughly, with not a penny to offset them, and in some instances greater loss was sustained through equipment and dressings never returned

Of this $52,645 then, as charged on his books to all accounts, $22,162 was strictly charity, leaving him a balance of $30,483, which he had charged as being good and which he would seek to collect.

Of this amount he collected in the year $22,360 and carried over the balance, $8,123, as deferred collections From previous bills of past years he collected $4,285 which gave him a total of $27,645 as his year's income out of a possible total of $52,645, plus back collections

Thus this physician gave to his community about $25,000 in charity work, much of which should have been repaid to him or credited to him on a financial basis to offset the cry of what the endowments and charitable citizens had done for the indigent in their community

This physician said he was bitterly scored, time and time again, when the subscription lists were being passed around, and even by his own hospital board, as he felt he must subscribe something to each charity when a pay patient solicited from him, because his gifts were in the $10 00 to $15 00 class, and yet his charity and church gifts were over $1,000 that year, some of his gifts going to organizations and institutions where the executives thereof were drawing goodly salaries and he was giving his professional services for nothing and even did not receive so much as a letter of thanks at the end of the year!

How is this economic problem to be met by the physician? How are we to stem the tide and tendency whereby more and more of the physician's time, brains, and even money is being sought for, yes, and in some instances even being demanded under covert threat of club, church or fraternal boycott, in the guise of sweet charity, while the business man insistently demands of the doctor that his bills be paid, and while the doctor has always carried a stigma of being a poor payer Rich he may be in work done, but too poor, if honest, to meet his just debts, rear a family and maintain a decent standing in life, unless the economic pressure of the charity demand from all so many angles be lessened, and the doctor receives just pay for his services as rendered to all

Statistics of the average income of the physician compiled not so long ago gave some very startling figures, namely that his income was about $1,200 throughout the United States

When this is compared with the rising costs of medical education and the thought that money so expended is money invested and should have adequate return in later years, but must be productive through the doctor's own efforts, then the cry should not go forth that the doctor is rapacious and grasping, but rather that he is but seeking his just due

The rising cost of the care of the sick does not find its way into the pockets of the doctor, save as a very small percentage of that cost, as has been proven, over and over again in surveys This cost of care again is a community problem of taxation in seeing that all of the citizens of a given place pay their just share toward the general good done in a hospital and not "farm

at Poughkeepsie forced New York to ratify and thereby brought about the adoption of the Federal Constitution This attitude of Alexander Hamilton I would commend to your consideration It is an attitude which if followed by all of you, will tend to advance the progress of your profession.

If you cannot at all times get exactly what you want, or force others to adopt what you think is necessary to be done, consider carefully what the majority have achieved before you decide publicly to oppose it Consider whether on the whole that which has been done is not better than as though nothing had been done and whether you cannot advance your own interests and those of your fellow practitioners by advocating the conclusions of the majority

It has sometimes struck me as an amazing thing that in you gentlemen, trained as you are in scientific research, equipped with a scientific viewpoint, thoroughly inculcated with that attitude which accepts only that which has been proven, that in your own deliberations and sometimes in the programs which you espouse, the scientific spirit is so often lacking Were this not true, some ill-considered suggestions would not be made or advocated with such passionate heat. Before you embark on any program, I would commend to you the scientific attitude with which you, more than any other class of men, are and should be most familiar That attitude would require a complete, exhaustive, thorough, and painstaking examination of the question, a consideration of all sides of the question and of every aspect of it, a study of its relation not only to yourselves, but to the public also, a consideration of the arguments both for and against It is this attitude which the careful and intelligent lawyer sets before himself in the preparation of a case If he hopes to win he considers not only the merits of his case, but its possible demerits He considers not only the strength of the contentions of his client, but what strength the contentions of his adversary may develop He visualizes not only what can be said in favor of his side, but with equal caution that which justly can be said against it.

To me, at least, it seems that much of your discussion at your meetings savors of the Aristotelian or Platonic method rather than that which Francis Bacon made so famous By mere argument and logic you cannot progress It is by inquiry and research that you determine what the facts are, and having established these, you then can make your diagnosis, and the prescription and the remedy follow easily and naturally thereafter Sometimes it seems to me that in your meetings there is a dissipation of energy, and the discussion as ardent as it is sincere leads to no definite conclusion If you will look back over the various papers which have been presented to the medical meetings of your society for the past forty years, you will find that many of the problems which still confront you were being discussed, debated and considered before you were born or when you were still little boys And yet the solution of many of these problems has not yet been found

Would it not be wise if during each year it were determined that one or two of the most pressing problems should be attacked and studied, to the end that a scientific understanding of the underlying causes of the trouble should be unearthed and a scientific solution thus evolved? And that after this is done, a program be adopted for the rectifying of the trouble, and that then the entire membership of your profession should be enlisted as a unit for the achievement of the desired objective

Many of your problems are problems common to us all, they are the result of the trend of the times, of the march of progress, if it be progress You must understand all these things, you must study them Only in this way can you expect to keep abreast of the times, of public opinion, and to enlist and to receive the cooperation and the sympathy of the lay public, from which you draw your patients, your supporters and now, alas, too unfortunately, many of your opponents

In your profession as in any other, leadership is essential Choose as your leaders men in whom you have the deepest confidence, men of sound judgment, of course, of vision and enthusiasm Assist them toward arriving at the conclusion which will benefit you, and when these conclusions have been reached, fall in behind them, cheer them on, support them, help them, don't oppose them. With proper leadership and with proper cooperation you will find the public your friends and not your enemies, and you will then march on to the attainment of all that you desire

INDIVIDUALISM IN THE MEDICAL PROFESSION

By LLOYD PAUL STRYKER, COUNSEL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Abstract of an address at the annual meeting of the Medical Society of the State of New York, on the evening of Tuesday, June 4, 1929, in Utica, N Y

AT doctors' meetings, at social gatherings of physicians, and in private conference with them, the ills and the difficulties of the medical profession are constantly rehearsed and restated The economic difficulties, the indifferences and misunderstanding of the public, the ingratitude of patients, the indifference of the lay press, the problems in the legislature, the obtrusive and ofttimes ill-considered interference of lay bodies—these things and many more form the staple basis of discussion in papers read before societies of doctors and in their private converse The troubles so frequently repeated and rehearsed have a real existence and the constant discussion of these topics is therefore justified They bring, however, a train of reflections which merit, at least, equal consideration and attention They force the question, what are we going to do about it?

For whatever it may be worth, I should like to give you my own reactions—whatever else they may be, at least you will accept them as the impressions of a sincere friend and strong well-wisher both of your profession and of the individual practitioners who compose it

Constantly before lay juries, frequently before the legislature and elsewhere, I have given voice to eulogy and praise of the great work in which you are engaged and of the fine unselfish spirit with which you carry on But when I have you all alone in private converse, I think perhaps it would be more helpful were I to dispense with the praise which I could justly utter, and were I instead to speak quite frankly, and if it be to some extent in criticism, it will be understood as the constructive criticism of your well-wisher and your advocate.

I have had occasion innumerable times to speak in praise of your individualism I am an individualist myself and I strongly believe that the state is ordained to preserve and protect the rights and liberties of the individual rather than that the individual exists for the mere purpose of rendering service to the state I am in strong sympathy with your individualism, I respect it, I admire it, but it has its defects as well as its advantages We live in an organized society, we live with and among human beings However much we reverence the ideal of liberty, organized society involves to some extent the surrender of liberty Organized society is a give and take The more complicated government becomes, the more restraints upon our individual liberty are necessarily imposed In our complicated modern life, while we should preserve all that is fine in independence of character, all that is strong and admirable in the maintenance of our individual views, we should never forget that to accomplish anything, cooperation is essential Of all the classes of men with whom I have come in contact in the course of my life, I have found none who find it more difficult to cooperate and to unite than the members of your profession. In your professional life, as in government, these aphorisms hold "United we stand, divided we fall!" "In union there is strength"

It is a splendid thing to have self-confidence It is a splendid thing to have the courage of one's convictions It is a splendid thing to be ready to strive, and if necessary to fight for one's beliefs It is an admirable thing to possess a staunch confidence in the correctness of one's views It is an admirable thing to be able and to be ready to advocate what one believes in with force, with eloquence and with persuasive power But it is an even finer thing for the self-confident man, who has had his say and who has been overruled, to have that largeness of character and of vision which enables him to cooperate with the majority which has overruled him No friend of yours could criticize any one of you for championing his beliefs with courage and with persistence, but where this has been done and your county society or the state society has overruled you, it will not advance the cause of medicine if you stand aside and seek to obstruct what the majority of your brethren, after due deliberation, have concluded is a wise program And yet all too frequently this is done by the members of your profession, and it is for this reason that as a society you find yourselves with less influence than that to which you are in all justice fully entitled

When the legislature or the lay public turns to you for advice, it all too frequently finds such a contrariety among you, such dissonance where there should be harmony, such vigorous dissenters, that it sometimes concludes that the medical profession does not itself know what it wants

Alexander Hamilton went to the Philadelphia Convention of 1787 with certain definite concepts of what the Federal government should be The Constitution which eventually emerged from the debates bore but slight resemblance to the theories which he had sponsored The Constitution which finally came from Philadelphia was far from satisfactory to Alexander Hamilton, and yet he did not sulk in his tent, he examined it and concluded that defective as it was, it was far better than nothing at all That even that plan of union was better than no plan at all, and so he devoted his persuasive and his luminous intellect to the composition of the Federalist papers—which have ever since been regarded as authoritative expositions of the Constitution—and in the Convention

The disease, when located in the groins, or more accurately upper thighs, described formerly as eczema marginatum, became very prevalent and was later named red flap and jockey (or jock) strap itch It is especially apt to occur among wrestlers with very abbreviated clothing and seems here to be directly contagious, although as a rule it is a mediate infection This exception may be due to the fact that in wrestling there is violent perspiration and minute abrasions of the skin are apt to occur while this is not the case in coitus although direct contact is present

My own case of epidermophytosis may be of interest in this connection as it has existed for twenty-four years and probably for twenty-five longer as I can recall having had cracks between the toes occasionally since early youth Since hitting upon the pine tar ointment and iodine-camphor treatment ten years ago it has given me no trouble except on three occasions About six years ago there having not been the slightest trace of the disease for two years, I believed it to be cured and gave up the use of the iodine-camphor lotion for six weeks during my vacation Upon my return a severe attack of epidermophytosis developed between the toes and extended to the balls of the feet It required nearly three months of the pix ointment treatment to restore the feet to an apparently normal condition Two years later I used the lotion during my vacation irregularly with the result that another severe attack occurred

At the 1927 annual meeting of the American Dermatological Association, held in May upon a steamer in the Chesapeake Bay, the strangeness of ship life made me forget to use the lotion for five days although I had taken it with me Upon my return the most obstinate attack I ever had occurred and the toes were not cleared up for ten months Pix ointment failed this time and every other form of treatment, including permanganate of potash, Whitfield's ointment, mercurochrome, gentian violet, etc, and the feet only returned to their usual, apparently normal condition after abandoning all remedies except the camphor-iodine lotion applied twice a day

Another member of the American Dermatological Association has had epidermophytosis of the toes fifteen years, another twelve, another nine years and I presume there are many beside us four I wrote to two of these physicians a few weeks ago, stating my opinion as to recovery in this location and requesting them to inform me whether or not their toes were cured Neither replied, hence it is probable that they are not. If dermatologists fail to cure the disease in themselves it must be considered as extremely obstinate, if not incurable, in this location

I have examined several patients who stated that they were cured, but who, upon examination proved to be still affected and I have never yet seen a case of epidermophytosis of the toes which was cured On this account it is well to inform all patients that the disease between the toes is extremely difficult to cure and very likely to be transplanted to other parts of the body and to advise them to treat the toes indefinitely with some preparation, like the iodine camphor lotion, which will insure the latency of the disease, until a real specific is discovered

Karrenberg, in his article, "The Present State of Epidermophytosis in Europe," in the Archives of Dermatology and Syphilis, Nov 1927, states that Keller of Freiburg "Cultivated epidermophyton from the healthy skin between the toes of a patient who during the previous summer had had eczema between his toes which was apparently of mycotic origin" This statement certainly supports my theory that in this location the disease is almost if not quite incurable and the article should have read "apparently healthy skin"

A routine method of examining the toes is of great importance The feet should not have been washed for two or three days The toes are to be separated and the interspaces carefully cleansed with dry absorbent cotton before diagnosis is attempted The most frequent condition is a white, sodden epidermis, somewhat resembling the condition of the hands after long immersion in water, less frequently small vesicles, often scaling and fissures The conditions are most pronounced, generally, in the fourth interspace In some cases all four conditions will be encountered

Several times I have started to examine all cases for this condition, irrespective of what skin trouble caused them to consult me Unfortunately my good resolutions waned each time but a very large proportion of those examined showed epidermophytosis of the toes, 82 per cent. Strangely one of the six negative cases was a fairly regular gymnasium attendant. Of course this large proportion would hardly be found again in a similar series of cases

It would therefore seem a good routine practice to examine the toes in all cases of skin disease as it would clarify many in the same manner as a routine Wassermann

I shall probably be criticised for this attitude but, from my own experience, I believe epidermophytosis to be intrinsically a disease of the toes The ideal conditions for the propagation of fungi, warmth and moisture, are here present to an eminent degree. All of the cases which I have diagnosed as such have also had it between the toes I must confess that I have not recognized some of the forms mentioned by Dr White in his admirable article, "Fungous Diseases of the Skin" and am open

SOME PHASES OF EPIDERMOPHYTOSIS

By E WOOD RUGGLES, M D, ROCHESTER, N Y

Dermatologists have been rather surprisingly slow in recognizing how large a proportion of skin diseases is caused by the epidermophyton, since a few years after the description of eczema marginatum by Hebra, 1860 Köbner, Pick and Kaposi discovered it to be of mycotic origin and Saboreaud isolated and described the fungus, the epidermophyton inguinale, in 1907 Only the very latest text books consider it as an independent skin disease Until then it was loosely described along with eczema, dyshidrosis, etc

It has been suggested by some authors with apparent reason, that the enormous increase in the number of cases reported of late years is due, not merely to greater accuracy in the diagnosis of cases formerly regarded as eczema, etc, but to an epidemic following the World War We all know that, following every war, there is a widespread epidemic of scabies, lasting several years

I presume many of the dermatologists present will dispute some of my conclusions regarding this protean disease which has suddenly occupied the attention and research of the dermatologic world Personally, I believe it to be the most frequent skin disease in America I am aware that it only occupies the fourth place in the lists of those specialists who keep a record of their diagnoses but I am fully convinced that, if the toes had been separated and the interspaces carefully cleansed with dry absorbent cotton, in all cases of acne, eczema and alopecia furfuracia, epidermophytosis would take the lead

A large number of cases reported as eczema would be dropped from the statistics if an examination of the toes were made I believe that three-fourths of all cases of apparent vesicular eczema are due to the epidermophyton and a good many cases of squamous eczema also, especially those which are mildly vesicular at the onset

In our practice we frequently meet cases which we have diagnosed and treated as recurrent eczema which we finally find to be a reinfection with epidermophytosis from the toes Nearly every case of so-called eczema of the groins is epidermophytosis except the few which are extensions of an anal or vulvar eczema Practically all cases of eczema of the nails are due to the epidermophyton or the tricophyton

My investigations warrant the assertion that nine-tenths of all regular habitués of gymnasiums and a very large proportion of those who use the showers, barefooted, in golf clubs, fraternal organizations, etc, are afflicted with this disease A prominent member of the American Dermatological Association thought this a gross exaggeration I therefore went to the Rochester Central Y M C A gymnasium and asked the physical director to permit me to examine the feet of the men in a very active class Twenty-five came to me at his office Every one was infected, seven severely, three mildly

I then thought it well to examine a class which was not so active or regular, the business men's Only nine of these appeared, probably the others were shy about showing their soiled feet Every one of these was infected also, two rather severely This makes 100 per cent in thirty-four cases

The time these thirty-four persons remembered having had the symptoms varied from three weeks to forty-three years The average duration given was nine and one-half years and all had undoubtedly had the disease for longer than they stated for a large proportion of cases has no subjective symptoms

Only recently seven cases have been referred to us who had used the showers in the Elks Club in this city The physical director of the Y M C A. came to me a year ago on account of having herpes zoster I said to him, "Mr W, you have been barefooted on gymnasium floors for a good many years I would like to examine your feet as you probably have a form of ringworm" He protested that he had never had any trouble with his feet but examination disclosed pronounced epidermophytosis between the toes and he then remembered that he had an annoying itching of the toes in summer

This is certainly a serious condition and one which will continue to spread the disease even after the war epidemic has subsided The most practical prophylaxis, in my opinion, would be that every user of shower baths be required to put on a pair of the paper slippers which a great many clubs provide for use after the bath, immediately upon removing the socks, discard them when stepping into the shower and put on a fresh pair after the bath To do only the latter is to "lock the door after the horse is stolen" In addition all gymnasium members should be prohibited from leaving their lockers or going on the floors barefooted Infected persons should never go barefooted in the home People with infected hands should never shake hands with others nor use utensils which others are likely to touch Of course this could only be accomplished by extensive dissemination, through the newspapers, of information regarding the frequency, seriousness and contagiousness of epiderompytosis

the use of calamine lotion whenever itching occurs and employ *x-rays for the dermatitis* although they have no fungicidal effect

There are quite a few cases where the foregoing treatment is inadequate and in these we have tried the many other methods suggested Two per cent mercurochrome has proved very useful in several cases but, from my own experience, I do not regard it as specific Two per cent gentian violet has been mentioned as valuable but is such an all-pervading and ineradicable stain that I have ceased using it The thymol 2½ per cent oil of cinnamon 2 per cent alcohol solution has, in our experience, proved irritating and not particularly efficacious We have tried Sharlit's and Highman's preparation, tetraidomethanamine, in about ten cases, each of which was aggravated by its use The best results in obstinate cases have been obtained by using Whitfield's ointment one night, the pix ointment the next morning, night and following morning, the second night Whitfield's ointment and so on One thus secures the keratolytic effects desired without too great irritation

The formula of Whitfield's ointment is benzoic acid 12 per cent, salicylic acid 6 per cent in cold cream

I have employed the following lotion

Ol rusci	3 iv
Spir camphoris	3 jss
Alcohol q s ad	℥ j

in several obstinate cases with pleasing results although it is too irritating in some and its use has to be abandoned It always produces hardening of the tissues and its use must be intermitted occasionally and an ointment substituted for a time For the frequent, annoying itching it is a specific and I can recommend its trial when dissatisfied with the results obtained by other methods

Recently I have had two cases in which the skin between the toes remained sodden and spongy in spite of all treatment I advised the use of powdered burnt alum several times a day The result was remarkable The severe discomfort ceased immediately and the epidermis became dry It is of course too early to appraise the value of the treatment

---

CHOICE OF ANESTHETIC*

By JOHN J BUETTNER, M.D, SYRACUSE, N Y

WERE one to attempt a choice of anesthetic from the opinions given in literature, he would be quite perplexed ere he arrived at a decision. These varied opinions apply to local as well as to inhalation anesthetics

Surgery must be viewed as a therapeutic agent, which provides relief or cure for ailments that will not yield to medicinal treatment Proper choice of anesthetic, as well as proper administration thereof, is a great factor in assisting surgery to bring about the desired result

This difference of opinion is not without its virtue, in that it causes greater care to be exercised in making a choice. It furthermore stresses the fact that neither the ideal method or agent has as yet been discovered It has been the means of stimulating research toward the desired result The knowledge of cause and effect is richer than ever, but the goal of Utopia has not yet been reached

The choosing of the proper anesthetic is dependent upon circumstances The aim in choosing should be that agent which will quickly, smoothly and safely induce and maintain anesthesia, and leave few if any post operative sequalae There is a marked difference in the available choice of anesthetics in large and small hospitals The large clinic or hospital usually has expert anesthesia and cooperating team work The method best suited can therefore be chosen On the other hand in a smaller hospital, there is lack of team work, not always expert anesthesia, and a lack of proper apparatus In the latter case it is necessary to use the method best suited to the qualifications of the one giving the anesthetic

The welfare of the patient should at all times be given first consideration This implies recognition of the physical condition and temperament. Surgeon and anesthetist should cooperate in choosing not only the safest anesthetic agent but should also agree on the proper and safe time to operate We might apply the words of Dr C B Schutz[1]—writing on Spinal Anesthesia—who says "As in most innovations in surgery, each has its loyal advocate—a loyalty that in some cases proves dangerous because of its blindness" These words might apply as well to all anesthetic methods

That the choice of anesthetic is of interest to surgeons was manifested when Dr Stanton[2] sent out a questionnaire to 640 surgeons picked at random from the directory of the American College of Surgeons The answers were quite interesting, in that it was learned that ether is still the anesthetic of choice with the great majority of those surgeons asked The questionnaire was divided into choice for (1) good risk cases, (2) poor risk cases, (3) hernias, (4) goitres, (5) fractures, (6) spinal anesthesia

* Read at the Annual Meeting of the Medical Society of the State of New York at Albany May 22, 1928.

to conviction in the future In contradistinction to the effects of the disease in other locations it produces as a rule little or no discomfort between the toes When pruritus does occur a peculiar burning sensation is also present

The dermatitis produced by epidermophytosis in other parts of the body is frequently a severe and even disabling disease and often extremely obstinate, but it can be cured through perseverance and ingenuity and I doubt very much if it ever relapses thereafter unless the toes are also infected Of course some persons are very susceptible to the disease and with the extensive distribution of the fungus, even in the air, reinfection is always possible, in the absence of disease of the toes

The improvement and apparent cure of the interdigital form are much simpler matters than elsewhere, but relax your treatment for a short time and it is in evidence again, and so long as it remains in this location there is the likelihood of its being transplanted and causing the same violent dermatitis which you have painstakingly cured

To accentuate the importance of the interdigital location I may state that while I have seen numerous cases of the reappearance of the disease in other parts of the body in those who have neglected my admonition to continue painting between the toes indefinitely with the iodine-camphor lotion I have never known of a relapse either between the toes or on other parts of the body where the use of this remedy was persisted in

Weidman, "Laboratory Aspects of Epidermophytosis" Archives of Dermatology and Syphilis, April, 1927, states, "I believe that the disease is primarily and essentially interriginous, i e, one which affects primarily the groin, toes, etc, but which may come secondarily to affect other parts of the body also"

Dr A M H Gray of London in his discussion of Dr Williams' article, "The Enlarging Conception of Dermatopytosis" at the Golden Anniversary Meeting of the American Dermatological Association, Philadelphia, May, 1926, stated, "I think the spread is always from the toes to the groin" I am thankful to find this much support of my position

The more difficult a disease is to treat successfully the greater the number of remedies suggested For a good many years Whitfield's ointment was the sheet anchor of dermatologists The treatment suggested by me in the article "The Treatment of Some Affections of the Hands and Feet," read at the Annual Meeting of the American Dermatological Association, in 1922, subsequently found many adherents Many other forms of treatment have been advised since then, the most popular being the use of a two per cent mercurochrome solution, originated at Baltimore Lain of Oklahoma recommends the use of one dram of salicylic acid in an ounce of alcohol for a few days until rapid exfoliation is produced, followed by Whitfield's ointment Sulphur and chrysarobin are also favorably mentioned by others

In so protean a disease each of these remedies may have a place and in some cases several are necessary before good results are obtained In our own practice, where the dermatitis is very acute, we employ continuous wet packs of permanganate of potash 1 2000 or some times have the patient immerse the hands or feet in this solution twenty minutes or a half hour three or four times a day

When the dermatitis becomes milder, or at once in less severe cases, we employ the ointment suggested by me,

Zinci oxidi	z jss
Vaseline	3 ij
Ung picis liquidi	3 iij
Ung aquae rosae	3 ijss

This is applied twice a day and removed once a day with olive or mineral oil In a majority of cases this remedy gives very favorable results and clears up the condition in a reasonably short time

When the case, after showing considerable improvement seems to have become stationary we employ the other prescription advised in the same article,

Tinct iodine	drams jss
Spir camphor q s	ad oz j

This is applied twice a day with a camel's hair brush This treatment is always advised for the toes as soon as they improve sufficiently so that no smarting is caused by its use I invariably tell patients that the disease between the toes is extremely obstinate and that they will save themselves much trouble in the future by continuing its use indefinitely, dropping to once a day two or three months after the interdigital spaces look perfectly normal I also tell them that if they wish to experiment as to its complete cure, they may discontinue the use of the lotion after a few months, but a month later to have some other person, with good eyesight, examine the toes carefully as suggested above If the trouble still exists they had better continue with the lotion for the remainder of their lives

If the patient puts on fresh, sterile cotton stockings daily and wears them constantly during the whole twenty-four hours the improvement will be much more rapid Washing the feet daily with tar soap has seemed to assist and also scrubbing between the toes with one of the sand soaps I always advise

tion has brought on undeserved condemnation of a really valuable agent It will always have a definite place and rightly so

Chloroform is a most dangerous agent. It is mentioned by some only to be condemned Others, who know how to administer it, find it very valuable In hospitals, generally, its use is very limited Even in obstetrics it is being replaced by gas, or ethylene oxygen, rectal anesthesia, spinal, or caudal block

When it comes to nitrous oxide and ethylene anesthesia here, again, views differ in certain sections One always finds enthusiasts among surgeons, anesthetists, and patients When it does succeed it is because it is administered by those who know how

While some claim incomplete relaxation from gaseous inhalation agents, recourse may be had to either ether, or anoci

Undoubtedly the ideal anesthetic from every point of view is gas with anoci This takes care of the mental attitude of the patient, provides the necessary relaxation, and is as safe as any combination possibly can be

There are some indications for colonic-ether-oil anesthesia. The obstetrician is using it with great success In some specially selected cases of surgery it works admirably, provided the patient is properly prepared and then watched, after the injection is given It is not fool-proof, yet it has its place.

In brain surgery, where local anesthesia will not suffice, rectal anesthesia affords the best method as it does not give rise to increased intracranial pressure, which is one great factor to be observed in brain surgery It is applicable only in elective surgery, never in emergency cases

Intra-tracheal anesthesia has its advocates While this form of anesthesia had its birth in the United States, its greatest use now seems to be in England and Canada. Intra-pharyngeal anesthesia has replaced it here, altho there has been a revival, in some clinics, of the intra-tracheal method There is evidence of changing of methods all over the country, no doubt with the idea in mind of eventually finding the ideal

Psychology plays an important part in all branches of medicine There is no more fertile field for its use than in anesthesia, be it general, or local The psycho-anesthetist now occupies quite a position in anesthesia. Dr Stein, of New York, a dentist, recently demonstrated in Syracuse, (and has done it in other places), that he was able to hypnotize a patient, in order to have a tooth extracted without any appreciable pain This is quite beyond the ordinary, but shows that some of the ancient methods still have followers Perhaps a great deal of the success of some general anesthetists is due to the psycho-anesthetic powers employed

It is not difficult to analyze why there are a number of local anesthetic advocates When one sees the manner in which ether is at times given, it is easy to understand the reason for employing a different method to enable surgery to be performed

There are various agents used in local anesthesia, also various methods, depending upon the site of operation As was seen in the previously mentioned questionnaire, local anesthesia is used by some for certain operations, while with others it is routine

It is not applicable to all cases, any more than inhalation anesthesia is universally applicable Success comes only when each is used in properly selected cases by those who know how to administer them Deductions in neither case should be made from the results of novices, but from those who have a perfected technique

It is customary for the surgeon to use local anesthesia, except in some of the larger clinics, where the general anesthetist also administers the local It brings up the question, would it be more advantageous to have the general anesthetist perfect himself in the technique of local anesthesia? One reason, therefore, is that in a number of cases it is necessary to supplement the local anesthetic with inhalation anesthesia, or, if not, to supplement to assume the role of psycho-anesthetist It would be time saving to the surgeon and would have a helpful influence on the patient A further advantage of the general anesthetist would be that, in case of respiratory depression, he would be able to give carbon dioxide to stimulate respiration. At times, also, if the patient were nauseated, inhalations of oxygen could be used to great advantage.

For argument's sake we will admit that most operations can be done under some form of local anesthesia In these cases is due attention always given to the mental attitude of the patient? Would all gynecologic patients, for instance, care to submit to surgery, and be conscious thruout? Or, again, would all surgeons care to do this work with the patient awake?

This method of anesthetizing is by no means devoid of danger, both as it pertains to technique, or agent used The great preponderance of opinion today favors novocaine as the least harmful Others advise procaine, which is supposed to be similar to novocaine, but acts quite differently at times Eucaine, tutocaine, and apothesine all have their advocates Here, as with the general agents, there is a difference of opinion One often wonders whether this variance of opinion is due really to the agent, to the user, or is there some idiosyncrasy of the patient?

General anesthesia has been in vogue many years Local anesthesia, in comparison, is a mere infant Perhaps we are somewhat prejudiced, especially if we consider the words of the well-known local anesthetic advocate, Dr Matas[4], who says, " We have accustomed ourselves to ether and chloroform to such an extent that only in ex-

In answer to Question One, 555 use ether alone or preceded by ethyl chloride, nitrous oxide, or ethylene, 60% use ether alone without gas induction, 5% use ethylene, 4% use nitrous oxide, 1% use ethylene and nitrous oxide. Three surgeons use local for ordinary laparatomies, two use paravertabral, one uses spinal, or ether, twenty-five use anoci This shows the great popularity of ether for good risk cases

The poor risk cases showed a wide difference of opinion Some use more than one method in this type of case Over two-thirds of the straight ether users switch to some other method, over one-half of the gas-ether users make a change The changes are as follows 5% to ethylene plus oxygen, 7% to nitrous oxide plus oxygen, 30% to local, 42% to anoci, 5% to spinal The change from ether in this class is quite striking It shows a marked trend toward the gas anesthetic, with, or without, local One added question in the questionnaire would have been of great value, viz who administers the anesthetic? The question of expert anesthesia would, no doubt, have changed many answers in this questionnaire The switch in Class II from ether to local may have been due to lack of experienced anesthetists

In hernias 88% of the ether users change to local, 9% use anoci, 3% use spinal Here, again, the added question would have been of interest

In goitre cases the great number of ether users change to local, or anoci. Some change to nitrous oxide plus oxygen It was also noted that more changed to ethylene plus oxygen, than in laparotomies Some used colonic-ether-oil for goitres Ethylene plus oxygen in this type of case is meeting with increased favor

In fracture work 70% of the ether users still preferred ether, 18% use nitrous oxide plus oxygen Sixteen surgeons resort to light chloroform anesthesia, one surgeon reported using ethyl chloride It is quite significant to note throughout the questionnaire the almost total abandonment of chloroform for anesthesia Fractures might be classed as good risk cases, thus the greater use of ether

The answers to the use of spinal brought out the fact that 67% stated definitely they did not use it at all Several had used it and given it up One surgeon, after using it in 1,056 cases, gave it up because of the severe post-operative headaches Some have changed from spinal to sacral and caudal block 90% of those who use spinal do so only in bad risk cases

Reports in literature vary, and while some are enthusiastic, others advise caution Dr Pitkin, of Tea Neck, New Jersey, is a staunch advocate He has perfected a technique, and has experimented on solutions until he feels that he has found the ideal one His reports are quite convincing

Further review of Dr Stanton's report shows that some users of the volatile, or gas, agents returned to ether The reason given for the change was that were proper attention given to ether administration many of its objectional features would be eliminated The same reasoning applies to all anesthetics Here, again, the data from the added question would have been of interest In this connection recognition should be taken, not only of the effects of ether on the patient, but also on the anesthetist, unless a closed method of etherization is employed The open method of etherization, which is still advocated by some, but condemned by others, has a harmful effect on the anesthetist, and literature records a number of deaths of anesthetists from this cause The comment on nitrous oxide showed its value when administered by experts Hence, here we might presume that satisfactory gas anesthesia was obtained where expert anesthetists were employed

Ethylene users are all ultra-enthusiastic While it was admitted that in some cases ether or anoci were needed as adjuvants, this did not detract from its use

Complaints are at times heard that ethylene plus oxygen produces changes in the color of the blood, also increased oozing These conditions are, no doubt, due to lack of oxygen in the mixture The writer firmly believes that one great advantage of ethylene and oxygen lies in the ability to use large amounts of oxygen without minimizing its anesthetic value

The one great condemnation we hear of ethylene plus oxygen is its explosibility

Homer and Gardiner[3] have proved that ether is as explosive as ethylene, but not with as loud an intonation Yet ether is not tabooed We have always known that ether explodes in the presence of spark or cautery, but by observing the necessary precautions no accidents occur The same may be said of ethylene

Hence, why cast aside a really good anesthetic agent for no good valid reason. We might as well reason that inasmuch as morphine and strychnine are poisonous they should not be used. Proper precautions should be observed with drugs and anesthetic agents in order to achieve the best results

After summarizing the data in the above mentioned questionnaire one can readily understand why there is a diversity of opinion in general or inhalation anesthesia It is not difficult to diagnose poor technique, and improper attention to inhalation anesthesia

Let us take a cursory review of the general, or inhalation, agents we have to use

Ether is the agent most generally used While it is not as popular in some sections as in others it will never entirely disappear from the scene Some use it merely as an adjuvant to a nitrous oxide or ethylene anesthetic, while others use it following a gas induction Improper administra-

PACHYONYCHIA CONGENITA*

By GEORGE C ANDREWS, M D, and SAMUEL STRUMWASSER, M D, NEW YORK, N Y

IN 1906, Jadassohn and Lewandowski for the first time reported in the iconographia dermatologica a peculiar anomaly of the finger and toe nails which they termed pachyonychia congenita. The patient was a girl of fifteen and showed, in addition to the changes in the nails, other abnormalities of the skin and mucous membranes These changes in many respects resembled those found in keratosis follicularis of Darier, from which disease pachyonychia congenita was distinguished by the authors on account of the peculiar lesions of the nails and tongue For the past year a case which is almost identical to the one described by Jadassohn and Lewandowski has been under our care, and this similarity, as well as the apparent rarity of the condition, has lead us to a careful study and report of the case.

Following is a description of the condition as originally given by Jadassohn and Lewandowski

History—E C, fifteen year old girl, first seen June 15, 1905, presented a cornification anomaly of the skin and the nails The nail condition had been present since birth The duration of the condition of the skin is not known. The parents and seven other sisters were free of this condition, but one brother showed abnormal changes, which will be described below

Examination—The nail plates of all the fingers and toes are greatly thickened and so hard that it is impossible to cut them with scissors, the father having to take recourse to a hammer and chisel to trim them The finger nails are of normal length and width, becoming thicker at the free borders and measuring three to five millimeters in depth They are for the most part transparent and pale, with smooth and glistening surface, and at the tips are grayish-black in color At the free borders here and there appear whitish-gray streaks

The toe nails are all greatly thickened, especially the large toe nail which resembles a condition of onychorgryphosis The surfaces are not smooth but show irregular transverse grooves The consistency is the same as that of the finger nails The growth of the nails is not especially rapid The patient is not conscious of any impediment to finer movements of the fingers

On the face, around the nose and the chin, are bright red, somewhat pointed papules, and on the nose are several vesicles with clear fluid, alkaline in reaction and sterile. There is hyperdrosis of the skin of the nose, palms and soles On the soles there are many callosities, which through maceration form whitish elevations In the summer, and seldom in the winter, there appear on these callosities painful large bullae, the contents of which are alkaline in reaction and show no organisms of any kind On the elbows and knees are definitely grouped pinhead-sized follicular papules In their centers there is a horny plug which fits into the papule in a crater-like depression The dorsum of the tongue is covered with thick, adherent, irregular shaped white plaques, sharply defined. At the borders and on the undersurface there are present white streaks and irregular, slightly raised, linear lesions The mucous membranes are otherwise normal

About four weeks after the patient was first seen, a definite eruption was noticed, which has persisted and which is present chiefly on the extensors of the arms and legs, on both scapulae, and in the region of the axillae and the gluteal region The eruption on the elbows and knees is most marked Most of the lesions are pinhead sized with intensely red bases containing a centrally located horny cone, whitish-gray in color The skin between these papules appears normal Removal of one of these horny cones left a slightly bleeding crater-like depression.

The above-mentioned four-year-old brother presents an analogous condition except that there is no involvement of the nails nor leukokeratosis of the tongue

Histological Findings—The examination of a lesion containing a horny cone (described above) shows a hyperkeratosis of the follicle surmounted by parakeratotic layers heaped up so as to encroach on the next lesion There is decided thickening of the rete with marked infiltration of the neighboring rete pegs in the cutis The rete cells are excessively vacuolated, here and there numerous and large keratin hyaline granules are present extending to the deeper layers The cutis shows slight edema and a moderate increase in cells

History—Our own case is that of a boy five and a half years of age, born in the United States of Russian Jewish parentage. He was the first child and has one other brother two years of age, who is free of this anomaly The boy was born of a normal labor, and there is no history of miscarriages The family history on both sides is entirely negative The condition was first noticed two weeks after birth when the nails on the hands grew out like talons and were cut off by the physician At the age of six months, the nails of the hands and feet began to fall off at intervals of one to two months This was preceded by an area of redness and bogginess surrounding the nail bed, all the nails being involved at one time or another At eighteen months of age, the child began to develop lesions on both

*Read before the Annual Meeting of the Medical Society of the State of New York at Albany, N Y May 23 1928.

ceptional cases do we think of the possibility of doing any serious surgical work without them There are many major surgical operations which can be done better, and more safely, with the help of local anesthetics, and it is merely force of habit that keeps us in the old 'rut'" These are the words of a master, and, as such, carry great weight It is quite interesting to question the local anesthetic advocates and ascertain why they are so enthusiastic Invariably the answer is that there was no experienced general anesthetist available, results were so distressing with inhalation anesthesia that they were forced to resort to other means It took time and perseverance, however, to acquire a perfected technique Furthermore, the manipulations of the surgeon under this type of anesthetic are always very gentle The same care of the patient with general anesthesia would give results quite different than ordinarily seen

Results in local anesthesia, if we note reports in literature, are not always ideal Failures are noted frequently and quite often it is necessary to supplement with general anesthesia Unpleasant sequalae and even fatalities have resulted, hence perfection has not been achieved with this type of anesthesia

To be fair, we should admit, however, that there is a place for all types of anesthesia The selection should be unbiased, and the patient should be the one to receive the benefit of the choice

The majority of patients today dread being hurt, hence prefer being put to sleep On the other hand there are patients who dread being choked and strangled when being put to sleep, hence frequently delay operation, or submit to local Where expert anesthesia with gas induction and maintenance is the vogue, we invariably find satisfied patients

Concerning post-operative nausea, which is a great "bugbear" of general anesthesia (but may be present with local also), one cannot promise absence therefrom no matter which one of the local, or general agents are employed Satisfactory preliminary preparation will minimize, if it does not totally prevent this complication

If we sum up the pros and cons of local or general anesthesia we shall find that it is too often a matter of personal opinion that brings about the choice, rather than the real needs of the case

Spinal anesthesia has its advocates That it has a place cannot be denied, but discretion is needed in making the choice, instead of making routine use thereof The surgeon may find advantages in its use while he is working, but can one always promise any better post-operative results therewith, than could be obtained by a properly administered gas-oxygen or ethylene-oxygen anesthesia? If the patient's expression is closely watched under spinal anesthesia, one does not always note lack of anxiety There are exceptions without doubt, but many certainly show signs of fear

Admitting that the various forms of local anesthesia are in their infancy, we cannot foretell what the future has in store for them, when we consider the marvelous progress that has been made in general anesthesia

Would it not be reasonable to expect that if the general anesthetist, in place of limiting himself to inhalation or general anesthesia, would assume the duties of local anesthetist, he would improve the technique thereof, and overcome some of the present day objections

In conclusion, let me stress that there is a place for each and every type of anesthetic, that best results are obtained by using discretion in making the choice Cooperation of surgeon and anesthetist is essential, and closer attention to psychology is advocated

the appearance suggesting a mild inflammation from the pressure or irritation of the overlying thickened epidermis The connective tissue seems to be normal

In the course of a talk with Doctor Howard Fox, after we decided to present our case, he told us about a child with a similar eruption in his care, and strangely his case is almost a complete counterpart of the two just given We are indebted to him for the privilege of including the following description of his case

History—S W, three years, nine months of age, born in the United States of American parents, presented a peculiar anomaly of cornification affecting the nails and cutaneous surfaces The lesions on the nails had been first noticed two weeks after birth, those on the skin, when the child was two years of age At the age of one year, he was said to have suffered from an enlarged thymus gland, which had interfered with breathing and which had been been treated by *x*-ray He had suffered from diphtheria shortly before the appearance of the cutaneous lesions The patient is the only child of young, healthy parents No similar disease is present in any of his relatives, including twelve first cousins on the maternal and four on the paternal side.

Examination—Examination shows the patient to be a well-developed, mentally active, fine-looking child, weighing 42 pounds The eyes are blue and the hair blond All of the finger and toe nails are abnormal The finger nails are of normal width but greatly thickened, the depth increasing towards the free borders The surface is smooth, presenting no pits, ridges or furrows There is some diminution of lustre The nails are grayish-brown in color, being increasingly discolored towards the distal ends, where there are some whitish streaks on the nails of the left hand. The nail-plates are extremely hard and firmly attached to the nail-beds There are no paronychia and no abnormality on the skin of the fingers There is no hindrance to the performance of fine movements The rate of growth of the nails is normal and the direction straight. The toe nails show changes similar to those of the fingers with the exception that the growth, if uncut, is in a curved direction (onychogryphosis) No subjective symptoms are caused by the changes in either finger or toe nails The scalp is normal There is no hyperdrosis of the face and nothing to suggest granulosis rubra nasi At the right angle of the mouth is a crusted area, apparently a simple herpes The mother states that the patient often has cold sores in this location which last several weeks The tongue is coated habitually but there is nothing to suggest leukokeratosis The teeth are in good condition and show no abnormalities On the extensor surfaces of the forearms there are pinpoint to small pinhead keratoses Over each olecranon there is an irregularly shaped, warty mass, the size of a bean, surrounded by small pinhead warty, spinous lesions On the lumbar and sacral regions, fairly numerous, grouped, small pinhead lesions are located, being rough to the touch and the largest having a red base and filiform projections The genitalia are apparently normal The lower extremities are affected chiefly above the knees and to a less extent on the anterior aspects of the legs The buttocks shows a similar condition to that of the lumbar region but with more marked filiform spines The thighs show a fairly profuse eruption of follicular keratoses, from a pinpoint to a pinhead in size, the largest having filiform spines The skin between all of the above described warty lesions is smooth and normal in appearance On the internal aspect of the great toes, metatarsal regions and heel of right foot there are pea to bean sized yellowish callosities, under which are painful bullae. On puncture they yield a clear sterile, alkaline fluid

Discussion—Referring to the original case, Jadassohn and Lewandowski stated that a definite diagnosis was impossible, and that the essential follicular hyperkeratosis brought to their minds Darier's disease and keratosis (contagiosa) follicularis of Brooke The plantar and palmar hyperidrosis was described in Darier's disease with additional localization on the nose and chin but leukokeratosis of the tongue was not described at that time in either affection The nail changes in their case had never before been noted and the various dermatologists who saw their case were unable to classify it For these reasons Jadassohn and Lewandowski chose the term pachyonychia congenita because in Brooke's disease as well as in Darier's disease no nail changes were at that time reported. Since their article, the condition of leukokeratosis has been described in Darier's disease and we feel, in view of the clinical and objective findings grossly and pathologically, that pachyonychia congenita is not a clinical entity but together with leukokeratosis is a cornification anomaly which forms a part of Darier's disease

knees which the mother said looked like warts, this condition gradually spreading to the elbows, popliteal spaces, buttocks, legs and ankles

During his infancy the patient had repeated attacks of vomiting, during which time he would be unable to retain any food for two or three days at a time Since infancy the child has shown excessive sweating of the palms, soles, and of the face, and at intervals also developed herpetic lesions about the mouth

Examination—The boy appears normal in size for his age, and is apparently in very good health He is somewhat backward mentally and replies to questions in a deep, guttural voice with single words His hearing and vision are normal, teeth are all carious The dorsum of the tongue is covered with a general white patchy coating, which is difficult to remove On close examination, the condition consists of confluent plaques, irregular in shape and slightly elevated The tonsils are greatly hypertrophied, and the patient presents the facies of an adenoid type of child The posterior cervical glands, epitrochlear glands and inguinal glands are all palpable

All the finger and toe nails are abnormal The finger nails are of normal width but greatly thickened, the thickness increasing towards the free border where they measure about three to four mm The surfaces are smooth and show diminution of lustre, being brownish gray in color The free borders are grayish-black in color and show vertical striations The nail plates are extremely hard and firmly attached to the nail-beds Some of the nails show transverse grooves The nails grow straight out and show no tendency towards upward or downward curvature Patient is not conscious of any hindrance in the performance of fine movements

Occasionally one of the nails becomes acutely inflamed, being surrounded by a bogginess, which, after a period of one to two weeks, falls off The nail-plate thus seen shows abnormal depth, increasing towards the free border, the underlying nail-bed being covered with a purulent, foul smelling exudate The new nail then begins to grow as any other nail would

Over the extensor surfaces of the forearms, elbows, knees, popliteal spaces and the anterior aspects of the ankles, buttocks and lumbar regions, there are follicular lesions varying in size from a pinhead to a pea These are grayish-black keratotic papules, having in their centers horny cones which fit into corresponding crater-like depressions The removal of these central cones is fairly easy, leaving a slightly bleeding cavity The eruption on the outer aspects of the upper and lower extremities is also follicular, resembling keratosis pilaris This latter condition is not constant and disappears spontaneously only to recur The intervening skin between lesions is apparently normal

At irregular intervals, usually after a history of undue exposure to rainy or snowy weather, the patient develops a series of yellowish waxy bullae These occur on the plantar surfaces of the toes, on the heels and along the borders of the feet These bullae are painful, puncture reveals a clear watery fluid which is alkaline to litmus At the present time the patient shows an oval bulla on each heel about three inches in length

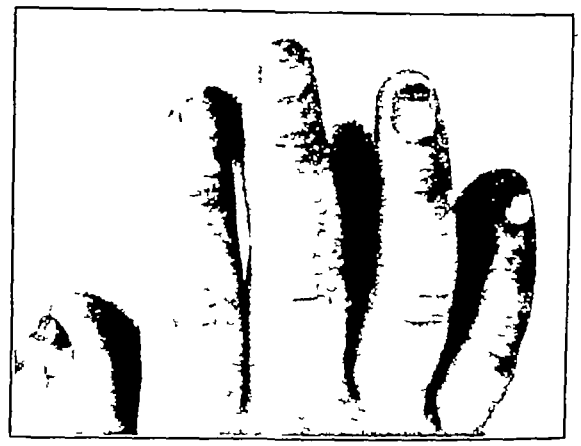

Fig 1

Histological Findings—The striking feature of the specimen is a thickening of the epidermis due to acanthosis and parakeratosis especially pronounced about the pilosebaceous follicles The rete pegs are lengthened and about the follicles the epidermal thickening causes funnel-shaped prolongations extending into the corium The openings of the follicles are dilated and plugged with imperfectly cornified and somewhat degenerated horney material, and horny plugs are also present in the sweat pores The basal-cell layer is irregular and the cells are swollen There is granular degeneration in the prickle cells and

Fig 2

the nuclei are deeply staining and some are crescentic, being pushed to one side of the cell by hydrops They resemble the "corps rond" found in Darier's disease The papillary bodies between the rete pegs are elongated and in places the apices come near the surface of the skin The blood vessels of the corium are dilated and surrounded by lymphocytes, mast-cells, connective-tissue cells and an occasional plasma-cell—

MEDICAL INDIVIDUALISM

The annual meeting of the Medical Society of the State of New York is the reflection of the year's activity of the Society and of its component county medical societies The outstanding item of progress, during the past year, has been the activity of the State Society in the domain of medical administration, which comprises the relation of physicians to other groups in giving health service to the community The actual examination and treatment of persons is necessarily done by the individual doctor, no matter whether he works alone, or as a hired adviser under the auspices of an agency But the relation of physicians to corporations, to States, and to Governmental agencies, is determined by medical organizations of which the Medical Society of the State of New York is representative.

Every physician by virtue of his calling is made a member of two organizations

1 The medical profession

2 The community in which he lives

The physician in private practice must conform his methods and standards to those of his medical confreres and of the leaders in medical research Establishment of these standards and methods is one of the great objects of the medical societies of the State and Counties

Physicians are also keenly aware of their obligations as citizens They have a peculiar responsibility to supply all forms of medical service to all people, but many obstacles stand in the way of their performance of that duty It is an old saying that you can "lead a horse to water, but you cannot make him drink" A doctor can offer his services to the people, but he cannot make them adopt his advice

One peculiar field of medical administration is that of educating the people to avail themselves of the service of family doctors

The relation of the medical profession to allied organizations engaged in health work came up for discussion before the House of Delegates on June third It is an auspicious fact that the members of the House of Delegates voted unanimously on questions which they understood On the other hand, they divided almost equally on what they did not understand It is also noteworthy that the members of the House of Delegates understood most of the questions which were discussed The reason for their enlightenment was twofold first, the projects had been considered by committees and described in reports which were published in the Journal from time to time throughout the year, and second, the plans had been reviewed in the annual reports which were available through the Journal for nearly one month previous to the meeting

The principles of medical administration underlying some of the newer projects involving the medical profession are illustrated by the execution of the law on the rehabilitation of crippled children The medical treatment of cripples is the function of physicians Why then is it necessary that a law should be passed in order that these children might receive proper treatment? The answer is found in the following reasons for the failure of family doctors to provide the treatment

1 Poverty—the most frequent cause, but the one least worthy of consideration, for the money for treatment is always readily obtained

2 Prejudice—the most potent reason, for patients and their parents fear the hospital, or the knife, or some other phantom

3 Ignorance—especially that of a wilful type Parents refuse to listen to their family doctor, but they take their advice from neighborhood gossipers

4 Laziness—parents wish to have a spectacular procedure done once for all, and they fail to persist in daily treatments which must be continued over months of time

Not one of these four conditions is under the direct control of physicians, but any one of them will prevent the doctor from giving the treatment which he is ready and anxious to supply Some other agency must correct those conditions before the family doctor can apply his curative measures It therefore follows that some other organization—governmental, charitable or educational—must cooperate with the doctors in teaching the patient and the parents And, on the other hand, doctors must both give and take the advice and assistance offered by other agencies

The care of crippled children has been largely the function of lay health organizations until last year when the legislature assigned the responsibility of diagnosis and treatment to the State Departments of Education and of Health The Governmental departments had the choice of two methods of procedure

1 They could utilize the services of family doctors and local surgeons

2 They could employ its own professional staff of doctors and nurses and make the care of the crippled children a purely state matter

The departments asked the advice and assistance of the Medical Society of the State of New York and the Committee on Public Relations, who thereupon met the representatives of the departments, and agreed with them regarding the methods to be followed At the very outset the department leaders said that the State wished the family doctors to give the treatment, and would pay them for their services to indigent cripples The State would do the work of overcoming the impediments which prevented the parents from accepting treatment for their children It would send nurses and diagnosticians, if necessary, who would instruct and inspire the parents to seek and

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5056

The Medical Society of the State of New York is not responsible for views or statements, outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

APPRAISING THE COMING YEAR

Before looking into the future the individual physician should take stock, as does the banker or business man, of what has gone before Every profession at the present moment is doing this, so complex and quick changing is the life of today requiring constant readjustment Organized medicine must not fail to realize its problems, and in this year it can do more than ever before to establish itself fairly, squarely, and in its proper light, in the good graces of the public Each physician who has a duty to perform to his local society and community, to the State Society as a Committeeman or otherwise, and to organized medicine as a body, will make good for himself only as he makes good for all concerned The Rotarians have a slogan, "He profits most, who serves best." This is a fitting motto to adopt for 1929-1930, if we wish to succeed

J N VANDER VEER

MEDICAL PROGRESS

What Is Basal Metabolism?—G Florence and J Endelme write formally on this subject as if the average practitioner were not familiar with the term While this may be true in some countries it hardly holds good in all, for in many the term is in familiar usage It is, of course, the resting and fasting metabolism expressed in figures which are based on square meter-hours of surface radiation The total surface of the individual varies greatly, and in computing the metabolism for 24 hours a certain standard of weight is taken, as 65 kilos While such a man at moderately active occupation should require about 2,600 large calories for the 24 hours, the basal metabolism may involve an expense of less than 1,500 calories In tests the subject should have fasted for 14 hours, the temperature of the room should be medium and he should be lightly clad The repose and relaxation should be as nearly absolute as possible To determine the basal metabolism, the standard method is to place the subject in the calorimetric chamber, but approximately the same result may be obtained if we can measure the amount of oxygen consumed in a given unit of time, which requires measurement of both the inspired and expired air In approximating the surface area of the body the weight in kilograms multiplied by the height in centimeters, and the product multiplied by the coefficient 71 84 will give the surface in square centimeters Allowances must also be made for age and sex The chief practical significance is in the estimation of the basal metabolism in various disease conditions —for example hyperthyrodism—*Le Journal de Medecine de Lyon,* March 5, 1929

Summer Rickets—J Schönen, one of the assistants at the Pediatric Clinic of the University of Greifswald, writes at considerable length under this title During the year 1928 the number of children from 3 to 18 months examined for evidences of rickets was 668 The number to present undoubted evidences of rickets was 89, and of this number 40 developed the first symptoms in the period June-September inclusive. One-half of these were nurslings who received public care Such a large percentage of summer rickets (40 in 89) is very unusual Naturally with this polyclinic material such tests as röntgenography and calculation of serum phosphate were out of the question, the diagnosis having been made by the presence of a rosary, enlarged epiphyses, and craniotabes The author does not claim that summer rickets differs from winter rickets in any essential particular, but simply suggests that the peak of incidence which should fall in the colder months is pushed forwards into the summer for reasons which may be meteorological but which have thus far eluded an explanation Naturally the high incidence of ultraviolet rays in the summer may be regarded as a preventive of the disease under ordinary conditions, but apparently wet and cloudy seasons have not been brought into direct association with the displacement of the maximum cumulation Housing conditions explain nothing nor do nutritional peculiarities Thus far a general prophylaxis which involves all newborn children has not been planned.—*Deutsche medizinische Wochenschrift,* March 15, 1929

Relationship of Zoster to Varicella—H Freund of Berlin gives a digest of this subject, beginning with the statement that the evidence of the etiological identity of these affections is becoming more and more cumulative This possibility was suspected as far back as 1888, while in the current year A. Netter reported 200 cases from France alone which bears it out In this kind of material zoster is traced to exposure to varicella or the converse There are still however dualists who do not believe that such cases are anything but coincidence Even in the author's clinic, where the two maladies are both common, no case of cross transmission has ever been noted, although others of large negative experience have in time witnessed the latter It is evident that all must depend in the long run on the character of the evidence, which must exclude all likelihood of mere coincidence. Having no personal material the author cites two recently observed cases reported respectively by Bokay of Budapest and Pincherle-Vegni of Sienna In addition he notes the fact that a single observer, Alterthum, has just reported 23 personal cases encountered in the past 9 years Since in rare cases zoster occurs generalized, the question must arise if this type of the disease is not identical with varicella The answer must be in doubt but it seems likely that generalized zoster in one subject has given rise to true chickenpox in an exposed subject. Another interesting question is that which refers to immunity Is a person who has had one of the two diseases immune to the other? The author finds a record of three cases which seem to show that varicella itself, as such, may be followed by a second attack or reinfection, and one may have second attacks of zoster Hence it is not surprising when a subject with one of these diseases is attacked

accept treatments, and it would meet the financial conditions by paying the family doctor and the specialists Making the agreements was an act of medical administration and constituted the practice of medicine as surely as the performance of a surgical operation Moreover, in making the agreements the doctors took a forward step in the discharge of their civic duties

Carrying out the agreements will require the closest possible cooperation of the doctors with representatives of the Departments of Health and of Education One detail that was clearly foreseen was that disputes would arise over the scale of fees to be paid to the doctors The adoption of such a scale was of special importance because the certification of bills would be made by County Judges, who themselves had asked the doctors to tell them what the proper charges should be

The committee suggested the scale of fees which was printed on page 526 of this JOURNAL of May first, but the House of Delegates declined to adopt the scale, on the ground of a fear of the possible consequences that would follow the formal adoption of any scale, yet there was no criticism of the fee list itself, and it still stands as the suggestion of the Committee on Public Relations

The meeting of the Public Relations Committee with the State Departments of Education and of Health was only a preliminary getting together, and more conferences will be needed, in fact, the leaders in the State Departments asked that a committee be designated by the State Society to advise the departments The House of Delegates was asked to designate the Committee on Public Relations as the advisory group, but opposition to this developed The discussion revealed that while the doctors criticized the departments for failing to consult the medical profession, yet when the departments asked the Medical Society to authorize the Committee to give advice, the doctors objected This attitude was obviously inconsistent, and the House of Delegates adopted the suggestion of an advisory committee

These agreements entered into upon the suggestion of the Committee on Public Relations set a new standard for the cooperation of individual physicians with the representatives of other organizations Family doctors may retain their entire independence, but the Committee on Public Relations has enlarged their field of practice so that doctors now may work for the State and crippled children on the same basis that they do for their own private patients These agreements are acts of medical administration and as such are prominent milestones of progress

---

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

X-ray Machines—This JOURNAL of June, 1904, contains an article on the comparative value of coils and static machines for the generation of current for *x*-ray machines, which says

"There is one question, the answer to which will in a majority of cases clearly indicate which form is the better for the individual in question, that is, 'Does he want to administer static electricity as well as do radiography?' If it is intended to limit the work to *x*-ray only, the coil will be more satisfactory Referring to the administration of static currents, the revenue obtained for such treatments is actual and often an important consideration for the practitioner The experience of most of the *x*-ray operators of my acquaintance who have installed static machines is that they are running them certainly as much and usually more for administering static currents than for the generation of *x*-rays, the demand being so imperative that the operator cannot refuse, even when he prefers to confine himself to purely *x*-ray work, many times the dollars spent by the beginner in radiography being more than supplied by giving therapeutic treatments"

"The advantages of static machines are

1 Wider therapeutic uses
2 Superiority in making long fluoroscopic examinations
3 If fitted with plane instead of ball bearings they make the minimum of noise
4 Do not wear out tubes so fast
5 Can be operated by hand or water power
6 Less danger of dermatitis

"The disadvantages of static machines are

1 Only the largest machines will penetrate deep parts
2 Time required for making exposures is long
3 Require more space
4 Cost more
5 Need more attention to insure dryness
6 Non-portable"

socalled second degree is reached, in which permanent deformity is quite apparent Then we must proceed to corsets and special gymnastics In a few cases nothing avails and the spine actually becomes rigid to some extent This is the third degree and treatment is no longer of value save by the use of a rigid corset which tends to arrest further progress of the scoliosis —*Le Progrès Medical*, April 6, 1929

Post-Operative Gastric Acidity.—In an endeavor to throw some light on the conflicting views as to the etiology and mode of healing of peptic ulcer, E Charles Lindsay and William Evans studied the gastric acidity, using the Ewald test meal, before and after gastrojejunostomy in 60 cases (49 males and 11 females) They summarize their findings as follows The state of achlorhydria found in the early post-operative test-meal may not, and in 58 per cent of the cases studied did not, persist The post-operative acidity value may in some instances exceed that found in the pre-operative test-meal, the operation, nevertheless, having completely relieved the symptoms The early post-operative test-meal taken 14 days after operation is an unreliable measure of the true post-operative gastric acidity and therefore is of no great value A persistent achlorhydria, as shown by the absence of free hydrochloric acid at both post-operative test-meals, occurred in 18 per cent of the cases The establishment of a state of achlorhydria, as found in the early post-operative test-meal is in no way dependent upon the acidity value found at the pre-operative test-meal Some factor other than neutralization of the acid gastric contents by regurgitation of the alkaline duodenal contents through the stoma appears to be instrumental in the lowering of the post-operative acidity value Temporary achlorhydria may be produced by the hemorrhage incidental to the operation, and this to a large degree may account for the unreliability of the early post-operative test-meal as truly depicting the post-operative acidity value The theory that the healing of duodenal ulceration with complete alleviation of the patient's symptoms after gastrojejunostomy is brought about by the neutralization (partial or complete) of the gastric acidity is not borne out by the present investigation A high post-operative gastric acidity, even in a concentration of 0 25 free hydrochloric acid, is not incompatible with perfect health, neither is it a fruitful cause of anastomotic ulceration. Alkali therapy, smoking, and the taking of alcohol appear to have no constant effect on the acid value, as shown by the Ewald test-meal, either before or after the operation It seems that the acid value tends to increase up to four years after the operation and then to decrease, but this finding should not be unduly emphasized, as only a few patients were studied from five to eight years after the operation.—*The Lancet*, March 30, 1929, ccxvi, 5509

Bone Changes in Gaucher's Splenomegaly — Although about fifty cases of Gaucher's disease have been reported, and attention has been called to bone-marrow changes, relatively little mention has been made of the presence of roentgenological evidence of the involvement of the osseous system Henry Milch and Maurice Pomeranz describe the roentgenological findings in two cases which they have studied and also in two others reported in the literature In these cases the diagnoses of rheumatism and bone tuberculosis were made before a pathological examination elucidated the true underlying cause Occasionally, as in those cases in which symptoms referable to the osseous system appear before the development of the pathognomonic splenohepatomegaly has attracted attention, it may be of value to bear in mind the value of roentgenological examination of the affected bones The changes in the bones in Gaucher's disease are characterized by medullary absorption, cortical thinning and expansion of the bone The medullary destruction which takes place, not as a diffuse process but in the form of scattered islands, doubtless represents the sites of proliferation of Gaucher's cells This alternation of areas of absorption with areas of denser bone formation gives the plate a characteristic mottled appearance. In view of the roentgenological evidence of bone repair in the two cases reported, it may be presumed that the mottling is due to stimulation of osteogenetic processes In the later stages Gaucher's disease is fairly easily diagnosed However, when symptoms referable to the osseous system predominate it may occasionally be necessary to exclude the presence of tuberculosis, lues, leucemia, or so-called "rheumatism" Clinically, the differential diagnosis may be established by the absence of leucemia, or polycythemia, the negative Wassermann, the presence of pinguecula, and the enlargement of the liver and spleen Roentgenologically, in tuberculosis and syphilis the lesions are usually destructive, while in Gaucher's disease they are defined by atrophy rather than destruction. In tuberculosis the lesion is usually localized, while in Gaucher's disease the bone changes are generalized, and in these diseases the mottling characteristic of Gaucher's disease is absent Lymphatic leucemia does not show the endothelial sclerosis, the atrophy, the joint changes, or the medullary absorption noted in Gaucher's disease —*Annals of Surgery*, April, 1929, lxxxix. 4

Diagnosis of Non-purulent Sinus Thrombosis—Dr P Hilpert of the Neurological and Psychiatric University Clinic at Jena sums up the easy diagnosis of purulent sinus thrombosis by means of the local stasis symptoms and the pyemia In the non-purulent form, however, diagnosis is something else—obscure and but scantily mentioned in reference works In some cases only functional mental symptoms are present, and

later with the other In other words the protection in certain individuals may be relatively brief Certainly zoster is not always the same disease and so-called symptomatic forms have nothing in common with varicella —*Klinische Wochenschrift,* March 25, 1929

Senescense of the Eye—Professor A Vogt of Zürich summed up the senile changes in this organ at a recent session of a society of general practitioners The dog, old at 12, shows practically the same changes in the lens as the old man who is 6 to 7 times the age of the dog, and the same may be said of the cow, old at 20, and the horse which may live much longer This fact shows that even in man the age of the eye can be no index of the general senescence The age of the human eye is usually predetermined by heredity although other factors may contribute There is a belief at present that pure senile cataract is amenable to treatment, may be arrested and even cured, this is founded on the well known fact that there is often spontaneous arrest or rather that the condition may remain stationary over long periods Nay, it even happens that there is a spontaneous improvement at times as shown by visual tests over long periods But despite good visual powers, the use of the slit lamp and of mydriatics will bring out the fact that over 90 per cent of people above 60 have changes in the lens due to age which are truly cataracts, although only an insignificant percentage of these come to operation for prevention of blindness All attempts to explain cataract by special mechanisms, like toxin action, must fail and this is equally true of the arcus senilis, both of these opacities often showing a strong hereditary element The progressive rigidity of the lens which causes presbyopia does not set in as a phenomenon of senescence for it has its inception in very early life It is normal for an old man to show some cloudiness of the lens and it is also normal if he is one of the few who escape, for the two represent different types of biological variation, and the immune subject is the extreme variant —*Schweizerische medizinische Wochenschrift,* March 16, 1929

Varicose Veins and the Stewart Method—The adverse criticism which the injection treatment of varicose veins has recently encountered leads Douglas H Stewart to defend his method In an experience of over fifteen years, including many thousands of cases, he has seen no instance in which results have been other than beneficial The beginner may expect trouble with the Stewart method because of his inexperience with it and because he will be tempted to hurry matters when delay would be more advisable He should first familiarize himself with the erratic course which veins pursue when varicosed, and he should pay some attention to foot strain He should be competent to recognize and treat such conditions as phlebitis, cellulitis, and gangrene It is important that each patient's reaction should be studied, since individual reactions are extremely variable At first a vein about midway between the ankle and knee should be chosen A drop of Stewart's biniodide solution (1 grain of calomel and 2 ounces each of tincture of iodine, alcohol, and glycerin) should be placed on the vein with a small applicator Through the center of the spot 3 minims of the vein solution should be injected with a hypodermic syringe and a fine half-inch needle The vein solution consists of the following ingredients Salicylic acid and sodium borate, of each 2 drachms, phenol, 6 drachms, glycerin, 2 ounces, spirit of camphor, sufficient to make 4 ounces The ideal method is to place 1 minim just beyond the pierced vein, 1 minim within the vein, and 1 minim on the proximal side The needle puncture should be closed with adhesive plaster, upon which is placed a wooden button-mold flat side down and held in place with another strip of plaster Not more than one treatment a week, on the same leg, should be attempted by the beginner, and the dose should be limited to 3 minims until accuracy and facility are acquired —*Medical Journal and Record,* April 17, 1929, cxxix, 8

Treatment of Essential Scoliosis—Dr E Gasne begins by a quotation from Kirmisson to the effect that scoliosis is an approbrium to orthopedic surgery He takes up in succession prescoliosis so-called, isolates essential scoliosis, and then sums up the management of the first, second, and third degrees of the condition Prescoliosis is merely an attitude assumed by the young scholar before actual curvature is present The subjects are poorly muscled, skinny, restless, and always changing their posture The author does not believe that this condition is a forerunner of true scoliosis although the subjects profit greatly by a course of anti-scoliotic gymnastics For the time being they may seem to be true scoliotics but at the next consultation there may be no evidence of curvature True scoliosis of school age is almost peculiar to girls, for men do not develop it until they begin to work at desks or benches We know little enough of the intimate nature of scoliosis although we surmise a close relationship with rickets There is no simple formula for treatment and the author enumerates a long series of measures intended to improve the general health and resistance He stresses cod-liver oil, and as an alternative, irradiated food substances and calcium phosphate For the rest the author seems suspicious of both retentive apparatus and gymnastics, until the

AN EXPERIENCE WITH AN INSURANCE CARRIER NOT AUTHORIZED TO DO BUSINESS IN THIS STATE

In the August 15th, 1928 issue of the Journal, in the Legal Column we printed an editorial entitled, "Bootleg Insurance."

Recently there has come to our hand a letter from a firm of lawyers in Lockport, which speaks eloquently of an experience encountered by the estate of a physician who carried an accident insurance policy in a company authorized to do business in a Western State, but not authorized to do business in the State of New York We feel that this letter will be of interest to the entire profession, and we therefore here reproduce the same at length

New York City

Gentlemen

I represent the estate of a member of your society, who was insured in a physicians' accident insurance company having its principal place of business at (mentioning a Western State). The insured died from the result of an injury to the ear caused by the use of a stethoscope, from which erysipelas followed by septicemia resulted causing his death I am satisfied that the beneficiary named in the policies has a right to the amount of the policies on the ground that death was the result of an accident. There are cases in this State sustaining this conclusion

The company takes advantage of the fact that it has no representative in this State upon whom we can serve papers in an action and refuses to recognize our claim I would like to know if you could make any suggestion that would aid us in collecting the claim.

I understand that this company (mentioning the name of the company in question) does a considerable business in this State without obtaining leave from the insurance authorities of this State Physicians whose attention has not been called to the status of the company are paying the company annual assessments without any chance of relief in case the company refuses to recognize their claims It occurred to me that possibly the Medical Association might consider it worthwhile to look into this matter to the extent, at least, of bringing the situation to the attention of its members

I shall be glad to receive any suggestion that you may have to offer

Yours very truly
(Sd) Donald S Moore."

TONSILLECTOMY—DEATH OF CHILD CLAIMED TO BE DUE TO DEFENDANT'S NEGLECT

In this case the mother of a deceased child brought this action against the defendant physician, charging that she took the infant child to the defendant for examination and after such examination the doctor informed her that the child's tonsils and adenoids were infected and it was necessary for them to be removed, to which the mother acquiesced. The complaint then charged that the defendant disregarding the duty placed upon him to skillfully and competently treat the child so negligently and unskillfully performed the said operation that as a proximate result the child died.

From the facts it appeared that the child, a boy about three years of age, was brought for examination to the defendant doctor, a specialist in diseases of the nose and throat. The chief complaint concerned the tonsils The doctor made a thorough physical examination of the child and advised the parents that the tonsils and adenoids should be removed. Pursuant to the doctor's instructions the child and the mother came to his office one day about 8 30 in the morning, and under an ether anaesthesia the defendant removed the child's tonsils and adenoids, the anaesthetic being given by a competent anaesthetist and the doctor being assisted by a competent nurse There was no hemorrhage or any unusual condition, the operation lasted about twenty minutes It was performed in the doctor's office which was equipped for operations of this type, as well as immediate after-care The child was

the diagnosis may be hysteria for want of something better At the author's clinic during the past five years five cases with this diagnosis of non-suppurative thrombosis were recorded The first case was recognized at the autopsy, death having been due to cerebral hemorrhage During life it was believed that the woman suffered from cerebral arteriosclerosis which might have explained some of her symptoms She suffered from depression and fear states, with epileptiform seizures At autopsy the find was marantic thrombosis of the superior longitudinal sinus The next case was in a much younger woman who presented incidentally continuous headache, the psychic confusional state being perhaps due largely to this symptom The diagnosis was meningoencephalitis, although bilateral exophthalmus suggested the possibility of sinus thrombosis Autopsy showed thrombosis and hematoma of some of the basal sinuses The diagnosis in the third case was encephalitis and this was true also of the fifth, while in the fourth no diagnosis was made All of the patients succumbed and the diagnosis was made by autopsy It is of course quite intelligible that recovery in these cases is practically out of the question and that an antemortem diagnosis is all but impossible The psychic symptoms agree most closely with those of brain tumor and in a less degree with some of the other organic cerebral diseases Hysteria was suggested in no less than three of six cases known personally to the author—*Klinische Wochenschrift,* March 12, 1929

Carbon Dioxide in the Treatment of Hypostatic Pulmonary Congestion—In a preliminary report Robert E Burns and William S Middleton quote from the literature experimental data which indicate that increased respiratory rate and depth increase the pulmonary flow and in turn the general circulation, that arterial blood pressure thereupon rises, and that a certain tension of carbon dioxide in the blood is optimal for the proper functioning of respiration and circulation Hypostatic pulmonary congestion in postoperative cases in general, and more especially in the aged and debilitated, is an indication for active respiratory stimulation. Carbon dioxide (with oxygen) furnishes an ideal agent for meeting the therapeutic indication Since 1925 the authors have given inhalations of 5 per cent. carbon dioxide in 95 per cent oxygen to a series of 10 elderly patients with fractures of the neck of the femur These patients constituted the poorest possible physical risk The results in this series, as compared with those in a series of 10 similar cases in which the inhalations were not used, were decided in favor of the carbon dioxide treatment No rule can be formulated for the dosage of carbon dioxide, as this is dependent upon the response of the individual patient. As soon as signs of discomfort or fatigue appear the administration of the gas should be stopped Ordinarily a patient will show some signs of distress after two or three minutes In some cases the inhalation is given every hour, in others every three hours, depending upon the condition of the patient It is especially important that the carbon dioxide be given during the first week following operation The suspicion or actual existence of pneumonia is an absolute contraindication to its exhibition Differentiation between pulmonary stasis resulting from respiratory depression and that dependent upon right-heart failure must be clearly made, since the use of carbon dioxide inhalations might be strongly contraindicated in the latter condition.—*American Journal of the Medical Sciences,* April, 1929, clxxvii, 4

Cure of a Case of Actinomycosis of the Lungs and Pleura—R. Schweizer of Zürich relates this case, which was originally regarded as tuberculous The patient was taken ill in December, 1923, with a left exudative pleurisy but was apparently well one month later and resumed his work Evidences of intrathoracic disease were soon apparent and were cumulative and in the following September he came under the author's care At that time there was also a flatness or percussion of the chest wall to the left which suggested actinomycosis This was extirpated by resecting portions of the 9th and 10th ribs The subjacent pleura and lung tissue were involved and there were mycelia in the sputum The patient was discharged in April, 1925, with a fistula and in poor general condition Shortly afterwards the right pleura showed evidences of inflammation but no effusion formed and the lesion healed spontaneously The hemoglobin was now down to 45 per cent The only treatment mentioned was potassium iodide and lipoiodine, and this was badly borne However, with the aid of climatic treatment the patient recovered sufficiently to resume his occupation The author explains the case as follows The patient as an upholsterer had much to do with straw mattresses and often carried a straw in his mouth Infection probably took place in the lung tissue and involved the left pleura by continuity (it is by no means excluded, however, that the patient did not at the time have a tuberculous lesion of the lung and pleura) The course of the disease later was one of remission and exacerbation The prognosis was very much against the patient. The most surprising feature of the treatment was the omission of röntgenotherapy (Enderlen in discussing the paper mentions this omission), for recently the Mayos have shown that this resource is the most dependable of all, being superior to drugs and surgery in the long run, these being in reality only accessories—*Schweizerische medizinische Wochenschrift,* March 2, 1929

LONDON LETTER

SMALLPOX AND VACCINATION

Readers of the London Letter may remember that in the autumn of last year reference was made to the increasing prevalence of smallpox in England as a result of the latitude allowed to 'conscientious objectors' to avoid vaccination A quotation was made from the League of Nations' Report that (excluding Russia and Spain) 90 per cent of the smallpox in Europe was to be found in England The type of epidemic is a mild one but the Ministry of Health admits that on an average 250 cases were notified each week during the first three months of this year It is not surprising then that the recent outbreak of smallpox on the liner "Tuscania" from Bombay to Glasgow has focussed attention once more on this grave menace to the health of the community Of the passengers and crew (numbering 900 to 1,000) 200 passengers left the ship at Marseilles, 650 passengers at Liverpool, and the remaining passengers and crew at Glasgow The task of following up these "contacts" is extremely difficult, but already some 35 cases of "imported" smallpox have been notified and five deaths have occurred The authorities maintain that they have the situation under control and that there need be no fear of a wide spread epidemic, but it is obvious that the task of the Port Sanitary Authorities to protect an unvaccinated community from the risks of "imported" smallpox is an anxious and onerous one So serious a view did the French Sanitary Authorities take of the risk of a spread of the disease that an announcement was made that no travellers from England would be allowed to land at any of the French Channel Ports unless they had been recently vaccinated The effect upon the tourist traffic was felt at once, and the French Government withdrew the order (which they maintained was not official) Whether such a precaution would have served any purpose or not, it is refreshing to see that our Gallic neighbors have not only a belief in the prophylactic value of vaccination but also the will to enforce it

THE ADOPTION OF CHILDREN

I attended a council dinner at the Institute of Hygiene in London recently, and had the good fortune to hear Mr Justice Eve expound the present attitude of the law toward the adopted child Mr Justice Eve is a highly respected Chancery Judge and a leading authority on the laws under which the State functions when it acts as guardian of children who, by the death of both parents or otherwise, are left without proper guidance or supervision These "Wards in Chancery" are protected by a very elaborate and complicated judicial code. But the discussion turned rather on the future of the adopted child Among the very poor the adoption often arises in this way An "unwanted" baby is "farmed" out by one of the parents, generally the unmarried mother, to a woman who agrees to bring up the child for a small weekly payment. After a time, the payments cease and the woman having by this time acquired a genuine affection for the waif, decides to adopt it In higher classes the child is obtained from some Society for the care of Waifs and Strays It is obvious that the after history of these adopted children must be of great medico-psychological interest It is the old question of the influence of heredity and environment. It may well be agreed that in most cases the unwanted child is the result of the union of two persons, one at least of whom is abnormal owing to some physical or moral taint. Many of these children must carry with them the seeds of inherited disease or mental instability. Will the new surroundings, the loving care and affection of the new "parents" eradicate the inherited tendencies, or will sooner or later the warped nature develop and show itself through the veneer of intellectual culture? It is essential that a "follow-up" system should be introduced so that the fate of adopted children should be known, and it is the duty of the State if it undertakes to legalize adoption to be in possession of this knowledge.

It is now more than a year since I wrote my first London Letter to you I am tempted to quote a little known poem of Monk Gibbon, referred to lately by our Prime Minister

Of all the cocks that greeted dawn today
How many will be heard a year from now?
How many preen their feathers on the heap,
How many strut the yard, how many crow?
So when I see the thousand voices raised
To catch their audience by the printed line,
Is it not folly to believe that one,
Sounding a twelve-month hence, may yet be mine?

H W CARSON, F R C S

carried from the operating table to the doctor's rest room by the anaesthetist The rest room was located not more than twenty or thirty feet from the operating table The child was placed in bed with a cover over him and the anaesthetist remained with the child for about twenty minutes, until he had completely come out of the ether The mother was in the room with the child and she was cautioned both by the defendant and the nurse not to permit the child to get up as that would be dangerous, but to keep him in a lying position and thoroughly covered Between 9 30 and 1 o'clock the child was seen on several occasions by the doctor, by the nurse, the anaesthetist and by the doctor's secretary On one occasion when the doctor's secretary came into the room, she found the child in the mother's lap She immediately remonstrated with the mother and placed the child back in bed The defendant then came in and also admonished the mother that his instructions must be obeyed and that the child must be kept in bed Up to 1 o'clock in the afternoon the child did not present any unusual condition, but about that time when the defendant went in to look at the child he noticed the child's color was very bad He immediately took the child's pulse and injections were then given of caffeine sodium benzoate The doctor was assisted by the anaesthetist and the nurse The child was given adrenaline chloride and transfusion of normal saline solution and hot water bags were applied to the child's feet, and the child was constantly ministered to by the defendant, his assistant and his nurse from 1 30 until about 5 o'clock, but despite all that they could do for him the child died The doctor, his assistant and the nurse never left the office from the time of the operation until the child died at 5 o'clock in the afternoon At no time did the child have a hemorrhage The cause of death was given by the defendant as pulmonary embolism The father of the child came to the doctor's office shortly after the child died and the mother stated to him that it was all her fault, that she had taken the child out of bed contrary to the doctor's instructions Neither the husband nor the wife expressed any dissatisfaction with the doctor's treatment at that time

At the trial the mother testified that a 10 30 in the morning the child vomited four towels of blood The dimensions of these towels were fixed by the mother as two feet by one foot She stated at that time that she called the attention of the doctor's secretary and his nurse to this fact, but they said that it was nothing and it was the usual thing after a tonsil operation. She also testified that at 11 o'clock the child vomited four towels full of blood, at 11 45 five towels full of blood and at 12 45 five towels full of blood, and stated that on each of these occasions she called the nurse's attention to the condition of the child and begged her to do something for the child, but the nurse said it was nothing and that the doctor was busy with other patients On cross-examination the mother admitted that although she knew that the doctor was in his office all the time she never made any complaint to him, nor did she directly seek his assistance A physician was then called by the plaintiff who admitted that he was to be paid a considerable sum for his testimony and who gave an opinion within the bounds of reasonable certainty that the child's death was due to loss of blood He also testified that the hemorrhages testified to by the mother could have been checked if proper measures were taken On cross-examination this doctor admitted that although he had been in practice for over thirty years, he had never performed a tonsillectomy operation, but despite this fact felt thoroughly competent to express an opinion in a case involving a tonsillectomy He was further interrogated on cross-examination in the light of the mother's story, and was asked whether or not it was not a fact that patients frequently died from severe hemorrhages, despite proper measures to check them, to which he replied that hemorrhages must always be checked The facts concerning the hemorrhages were of course, denied both by the doctor, his assistant (the physician who administered the anaesthesia) and his secretary, all of whom were present during the entire time from early morning until the child died The doctor was also supported in his treatment by one of the most skilled physicians engaged in nose and throat work in this city, who made a profound impression on the jury as to his skill as a physician and also his honesty and integrity as man The jury deliberated only a short time and returned a verdict in favor of the defendant doctor

the great majority of physicians of New York State

A point on which opposition was threatened was the suggestion of the Committee on Public Relations that it be authorized to be an advisory Committee to the State Departments of Health and of Education in the execution of the law regarding the care of crippled children At one time it seemed that the delegates might object to the suggestion on the ground that the Medical Society of the State of New York would seem to be seeking to enter fields which did not belong to them Dr George W Cottis of Jamestown, called attention to the frequent complaints of physicians that the Departments of Health and of Education had sometimes been inclined to ignore the practicing physicians in medical matters, and now some doctors seem to object to providing the means of giving the advice The reply was made that the Departments of Education and of Health could readily secure advice if they asked for it Dr J E Sadlier, Chairman of the Committee on Public Relations then explained that the State Commissioners of Education and of Health had said that they found great difficulty in finding any official body of physicians who were authorized to give medical advice to the departments, but when the Commissioners approached any group or Committee of doctors, the members feared to express the opinion of any one except their individual selves The suggestion of the Committee that it be authorized to speak for the medical profession in the care of crippled children was made at the request of the leaders in the two State Departments of Education and Health

After Dr Sadlier's explanation a vote was taken which resulted in unanimous approval of the suggestion of the Committee

The House of Delegates approved practically all the recommendations and suggestions of the President, the Secretary, the Council, the Counsel, and the Committees on Medical Research, on Legislation, on Public Relations, on Public Health and Medical Education, and on Medical Economics. The formal action of the House on all these matters will be printed in the minutes, which will be published in an early issue of the JOURNAL, probably on July first.

The reference committee to whom the report of the Council was referred, gave consideration to that part which described the policies and accomplishments of the NEW YORK STATE JOURNAL OF MEDICINE, particularly those sections referring to interpretative reporting, to indexing the records of activities of the Societies, and to the editing of advertisements The committee commended the report of the JOURNAL and its approval received the unanimous support of the House of Delegates

The election which occurred on Tuesday morning, was marked with harmony and dispatch, and with a minimum number of changes The elections were unanimous and the only ballots taken were those for the vice-speaker, and for the A M.A delegates and alternates The President-elect was Dr W H Ross of Brentwood, Suffolk County, who had served as Trustee for three years, and was Chairman of the Publication Committee, and Secretary of the Committee on Public Relations

A full list of the new officers and committee chairmen appears on page 750

THE ANNIVERSARY MEETING

The charter of the Medical Society of the State of New York requires the organization to hold an annual meeting without specifying its time or its program The meeting this year was held on the evening of Tuesday, June 4th, in the Hotel Utica, Utica, N Y, and was attended by an audience of two hundred doctors and ladies Its program consisted principally of addresses by the officers of the State Medical Society, and was as follows:

Calling the Society to order by the President, Harry R. Trick, M.D

Address of Welcome by the Chairman of the Committee on Arrangements, Hyzer W Jones, M.D

Reading of the minutes of the 122nd annual meeting by the Secretary, Daniel S Dougherty, M D

President's Address, Harry R Trick, M D, President of the Medical Society of the State of New York.

Address, James N Vander Veer, M D, President-elect of the Medical Society of the State of New York

Address, Lloyd Paul Stryker, Counsel of the Medical Society of the State of New York

The addresses of the President, the incoming President, and the Counsel, are printed as the first three articles in the scientific department of this JOURNAL.

NEWS NOTES

ANNUAL MEETING OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

The four-day meeting of the Medical Society of the State of New York was an eminent success from the point of view of the individual doctor, and of organized medicine The attendance was over 900, exclusive of about 200 ladies The hotels gave excellent service, and no one was heard to express dissatisfaction over any major point

The several features of the meeting were carried out according to schedule, and with a spirit of cooperation that resulted from an understanding of the problems before the medical profession The exhibitors were freely patronized, even to crowding at times, and the scientific meeting rooms were well filled

The social side of the meeting was also noticeable The three principal hotels being near to one another, helped the members to become acquainted If the rain of Tuesday prevented anyone from playing golf, or motoring to the historic spots in Utica and its vicinity, there was no gloom in the corridors of the hotels, but, on the other hand, the attendance at the scientific meeting on Tuesday afternoon was unusually large

The physicians of Utica and Oneida County set themselves an extensive task when they announced their intention of giving their expected guests the cordial reception for which the smaller cities are noted How well they succeeded is a matter of pride to all who saw their unobtrusive efficiency and enjoyed their hospitality

The cordial thanks of the Society are due to the Committee on Arrangements, consisting of Hyzer W Jones, Chairman, Utica, George M Fisher, Utica, Andrew Sloan, Utica, Edward R. Evans, Utica, Thomas H Farrell, Utica, T Wood Clarke, Utica, Joseph L Golly, Rome, F M Miller, Utica, William Hale, Jr, Utica

HOUSE OF DELEGATES

The House of Delegates of the Medical Society of the State of New York convened at 2 30 o'clock on Monday, June 3, 1929, at the Hotel Utica, in Utica, with the Speaker, Dr John A Card of Poughkeepsie, presiding The House of Delegates is the legislative body of the Medical Society and its presiding officer is the Speaker, and not the President, who represents the Executive department of the Society

The House is composed of the elective officers of the Society and delegates from the constituent county medical societies Over 150 members were present at each of its three sessions, which were held on Monday afternoon and evening, and Tuesday morning The members dined together between the sessions on Monday

The two principal matters of business transacted by the House of Delegates were the consideration of the annual reports of the officers and the committees, and the election of officers for the coming year

The reports of the officers and committee were printed in the JOURNAL of May first, and had been in the hands of not only the delegates but of the members also, for nearly a month Every opportunity had therefore been given the members to consider and digest the records of work done in the past year, and to devise plans for the future As a result the delegates were well versed in the affairs of the State Medical Society, and needed little instruction regarding the topics under consideration

A further point of importance was that the activities of the officers and committeemen had been reported throughout the year with unusual fullness and completeness There was no doubt regarding the attitude of the officers and the members of the committees No one came to the meeting with opposition or destructive criticism in mind, but the delegates supported the attitude of the officers and adopted the suggestions contained in the reports in nearly every instance The only marked exception was an adverse vote of 63 to 54 on the question of formally adopting the fee list for operations on crippled children suggested by the committee on Public Relations, as reported on page 526 of the May first JOURNAL Yet in this matter no one criticized the Committee for suggesting the fee list, for the Committee had suggested the list on the invitation of the Society of County Judges on whom falls the duty of fixing fees for operations on indigent children under the Law relating to the care of crippled children The opposition to the adoption of the fee list was based on the legal point of the possibilities which might arise if the list should be interpreted by the Judges and other officials as binding The list still remains as the fees which are satisfactory by

For he plugged the wrong foramen
And you'd never know the old face now!

In New York City the other day
At least so runs the tale,
The friends of Mrs Sanger
Thought the law was going to hang her
Or send her up for life in jail!
For a lady cop, a cynic,
Made a raid and closed the clinic
And put them all in the old hoose gow
Now every birth controller
Wheels a baby in a stroller,
And you'd never know the old place now!

A drug store used to be a place
Of the Apothecary's art,
But now they sell you old point-lace
And other Objects d'Art,
And salad, soup and chocolate cake,
And every kind of chow,
Since every corner druggist
Is an Oriental ruggist,
You'd never know the old place now!

COMMERCIAL EXHIBITS

The commercial exhibits were unusually satisfactory both to the members of the Medical Society of the State of New York and to the firms whose wares were displayed Thirty-three firms were represented by over seventy men

The representatives of the exhibiting firms were tendered a reception and entertainment on Monday evening in the Grill room of the Hotel Utica Dr O S Wightman, the editor-in-chief of the NEW YORK STATE JOURNAL OF MEDICINE, presided, Dr J N Vander Veer, the incoming president of the State Medical Society, spoke of the representatives making contacts with the doctors in their offices Dr W H Ross, Chairman of the Committee on Publication, expressed the appreciation of the State Society for the response of the advertisers to the suggestions of the Committee Dr Frank Overton, executive editor, gave a brief outline of the standards of the advertising pages and of the cordial response to the editor's suggestions for making the advertising pages as interesting, truthful and useful as the scientific part of the JOURNAL

Dr Hyzer W Jones, Chairman of the Committee on Arrangements, told of the efforts of the local doctors to provide attractive booths located so that they would be seen by physicians on their way to the meeting rooms

Mr D F Storer, representative of the John Curtiss Advertising Agency, said that in his experience the NEW YORK STATE JOURNAL OF MEDICINE was the only journal, either medical or lay, which gave advice and aid to advertisers in making up their advertising copy

Mr W P. Schmid of the Cameron's Surgical Specialty Company, praised the arrangements that had been made for the exhibits and spoke of the appreciation which the exhibitors felt for the consideration shown them by the Committee on Arrangements

Mr Robert Fitts, Jr, of the G W Carnrick Company, thanked the doctors for their kindly interest in the welfare of the exhibitors and advertisers

The success of the exhibits was due in great measure to the careful preparation made by the local Committee on Arrangements The booths were arranged in a circle occupying the whole mezzanine floor, across which the physicians had to pass to reach the registration table, the general sessions, and some of the section rooms

Dr O S Wightman addressed the crowded room of the general scientific meeting on Tuesday afternoon, calling attention to the exhibitors and urging the doctors to stop at the booths The result was that the physicians kept the exhibits in mind and made special efforts to examine the products

One standard by which an exhibitor judges his success is the number of doctors who take the trouble to stop at his booth and register However, an exhibitor can talk to only one or two doctors at a time, and he will occupy at least five minutes in the conversation and in securing the doctor's name and address Ten names an hour, or fifty per day, is a fair accomplishment for an attendant at a booth, and yet many far exceeded this record

When a crowd of doctors walk down an exhibit aisle, only a small proportion can stop at a booth Taking the number of names registered, it is probable that on an average each doctor present registered at four or five booths The exhibitors were so well pleased by the results attained that they sent the following letter to Dr Wightman

We, the undersigned, exhibitors of the 123rd Annual Meeting of the Medical Society of the State of New York, held at Utica, New York, June 3, 4, 5 and 6th, 1929, wish to take this opportunity to express our appreciation for the cooperation and courtesies extended to us by the Committee on Arrangements, Dr Hyzer Jones, Chairman, to the Director of Exhibits, Mr J B Tufts, and to the members of the Society, at large, who so graciously made our exhibit a success

Cordially yours,
G W Carnrick Co—Robert Fitts, Jr
Victor X-Ray Corporation—N R. Petri
George Tiemann & Co—A J Larkin
The Heidbrink Company—L. B Reason

SCIENTIFIC SESSIONS

The scientific sessions of this year's annual meeting were characterized by intensiveness rather than extensiveness There were seventy-seven numbers on the program, with one hundred and thirty-one speakers listed as authors or discussors This was about two-thirds of the number on the program last year, but the decrease was caused by the fact that every afternoon was devoted to a general session instead of to the nine sections as formerly The general session on Tuesday afternoon was on medicine, and that on Wednesday was on surgery

The meeting hall was filled to overflowing on both days

Reports of the scientific sessions will form a major part of the scientific part of the JOURNAL during the coming year, for the papers that were presented will be printed in the JOURNAL

THE BANQUET AND ENTERTAINMENT

The Utica meeting will long be remembered for the unique entertainment which was staged on Wednesday evening Immediately following the annual banquet, which was held in the Hotel Utica, the doctors and guests went to the parish house of the Westminster Presbyterian Church where a special operetta was rendered for them by the Players' Club of Utica The play was called the Pirate's Bride, but was popularly known as the Doctors' Opera, because it was composed by four physicians of Utica The plot and dialogue were by Dr. C H Baldwin, an orthopedist, the lyrics were written by Dr D E Pugh, an internist, the music was by Dr P L Turner, a surgeon, and the orchestration was by Dr F M Miller, Jr, another surgeon, whose father, Dr F M Miller, a gynecologist, played in the orchestra

The printed program contained the following description of the Players' Club

"The Players' Club of Utica is an amateur theatrical organization which had its origin some twenty years ago as a small social club whose members found amateur dramatics a congenial form of amusement.

"With the growth of interest in the 'little theatre' throughout the country, the aims and ambitions of the organization have enlarged It now numbers fifteen hundred subscribing members, of whom about two hundred take an active part in the work For several years it has maintained its own little theatre or workshop, with a professional director in charge, who, in addition to his work as dramatic coach, gives lessons in diction, stage production and make-up

"Each season groups of short plays are produced at the workshop, and four major productions are given for the entire membership The successful development of the club is evidenced by the fact that arrangements have just been completed for the purchase of a theatre in New Hartford, one of Utica's thriving suburban communities This will give The Players a permanent home, and the present policy of expansion contemplates the offering of an increased number of productions, not only to the associate members, but to the general public as well

"The medical profession has always been well represented in the club's activities 'The Survivors,' a friendly satire on the Gilbert and Sullivan classics, is usually referred to as 'The Doctors' Opera.' It was composed late in 1925 by three Utica physicians, and was first presented at a private performance before active members of the club In the spring of 1926 four showings were given to the general public In January, 1927, it was broadcast from Utica Radio Station WIBX, and in the spring of the same year it was given for the district meeting of The American College of Surgeons"

The play was done most pleasingly, and the songs and dances were well rendered Special songs of a medical flavor were written by Dr Pugh especially for the occasion, some of which were as follows

1

An American surgeon who would do
'Most anything for a fee,
From a vaccination to a ventral fixation
Tried a perineorraphy
He thought of his fame and fortune
And the home he would endow
But in thinking of his future,
He forgot to tie his suture,
And you'd never know the old place now!

A poor young man came in one day
He was looking thin and pale,
The doctor heard what he had to say
'Twas a most pathetic tale
He said his life was blighted
And the doctor asked him how
Why, someone did a Whitehead
And the surgeon was short sighted,
And you'd never know the old place now!

I heard a tale the other day
And I know it must be true,
A poor old man so the story ran
Had the tic douloureux
The surgeon said he'd operate
And 'twould be an awful Wow
As a surgeon he's a layman

SCHOHARIE COUNTY

The Schoharie County Medical Society held its semi-annual meeting in Parrott House, Schoharie, New York, on Tuesday, May 14, 1929

On motion, the following were duly placed in nomination for the several offices of the Society for 1930 President, Edgar S Simpkins, Middleburg, Vice-President, Joseph F Duell, Jefferson, Secretary, Herbert L Odell, Sharon Springs, Treasurer, Le Roy Becker, Cobbleskill, Censor, Willard T Rivenburgh, Middleburg

A motion was made, seconded and carried that our delegate to the State Society be instructed to work for the adoption of the following or a similar resolution.

"RESOLVED, That the Medical Society of the State of New York in (1929) meeting assembled, declares its opposition to the introduction or enactment of any law that will change the policy of the State of New York in the matter of birth-control or sterilization or so amplify the police power of the State as to threaten the money or man-power of the State, or its physical, moral or economic security, or the safety of its citizens, or to disturb the safeguards thrown about the practice of medicine in the State of New York as contained in the Medical Practice Act"

The Comitia Minora reported favorably on the applications for membership of Roy G S Dougall, and Ward L Oliver, of Cobleskill, and they were duly elected

Dr Christopher S Best of Middleburg petitioned for Retired Membership The petition was approved and the Secretary instructed to present same to the Secretary of the State Society

After a very delicious luncheon came the real treat of the day, the Scientific Session, "Rabies and Tetanus," Dr H F Senftner, Associate Director of Communicable Diseases, State Department of Health, Albany

"Poliomyelitis," illustrated, Dr Francis F Harrison, Mary Imogene Bassett Hospital, Cooperstown

The attendance was large, nearly every member being present.

C L OLENDORF,
President

H L ODELL,
Secretary

SARATOGA COUNTY

The semi-annual meeting of the Saratoga County Medical Society was held at Newman's Lake House, Saratoga Springs, N. Y, Wednesday evening, May 29, 1929

After the luncheon, the business program was taken up

The applications of Dr Benjamin Seaman and Dr N Stanley Lincoln for membership in the Saratoga County Medical Society having been received and acted upon by the board of censors, they were elected to membership

Dr John MacElroy gave a short address on "The Life of Dr A M Burt," one of our deceased members

Dr Earl King gave a short address on "The Life of Dr John Ledlie," one of our members who had died recently

A motion was made and seconded that the president be empowered to appoint a committee on arrangements provided the Fourth District Branch of the New York State Medical Society decided to hold their annual meeting at Saratoga Springs, New York. Carried

A motion was made and seconded that the delegate to the State Society meeting be instructed to vote as he thought best on a bill relating to standardization of fee as regard to taking care of handicapped children

Following the business session interesting case histories were given by Drs Comstock, Crissey, Mauro, MacElroy, Callahan, Loop and Downs

Moving pictures on "Infections of Hands," and one on "Relations of Absorbable Sutures to Wound Healing" were shown

Meeting adjourned

THE WOMEN'S MEDICAL SOCIETY OF NEW YORK STATE

The annual meeting of the Women's Medical Society of New York State is always held at the same time and place as that of the Medical Society of the State of New York, except that its sessions end at the beginning of the scientific sessions of the general society The Women's Society this year met in Utica with over forty members present out of a total membership of about one hundred and twenty The sessions began on the afternoon of Monday, June 3, with a business session The evening was devoted to a banquet, and a scientific session was held on Tuesday morning Then in order to emphasize their connection with the medical profession, the program says "2 p m First session of the General State Society"

The purposes of the Women's Society as stated in its constitution are "To bring the medical women of New York State into communication with each other, for their mutual advantage, to encourage social and harmonious relations within the profession, to extend medical knowledge and to advance medical science." Practically, the society has functioned in bringing more women into the habit of regular attendance at the annual meeting of the Medical Society of the State of New York The Women's Scientific Session gives more women physicians an opportunity to present scientific papers, and thus demonstrate their interest in the progress of medicine

The reports of the committees were given on Monday afternoon, that of the Medical Education Committee being of special interest This Committee was organized in 1917 to create and administer a fund to help in the education of worthy women deserving medical education The committee has been distinctive in its contribution to the encouragement and help it has given to women in the Orient Dr Greene reported the progress of some of the committee's investments Dr Yew of Korea, one of the first to be helped by this fund, is a graduate of Ewa College and Tokio Medical College She is an active woman, being a promoter of the Women's Medical Institute and on the Judicial Board Dr Hyan, also a graduate of Tokio Medical College, is now working at the Lillian Harris Memorial Hospital at Seoul, Korea.

The program of the scientific session was as follows

Tuesday, June 4 9 A M

(1) Address by President of New York State Medical Society, Harry R Trick, M D, Buffalo
(2) Anemia, Katherine L Daly, M D, Rochester, N Y
(3) Factors in Surgical Diseases with Special Reference to Thrombosis, Embolism, and Certain Bleeding Conditions Margaret Stanley Brown, M D, Fifth Avenue Hospital, New York, N Y
(4) The Infant Feeding Situation at Children's Hospital, Philadelphia, Pa. Elizabeth Kirk, M D
(5) Present Day Methods of Testing the Hearing Among School Children. Emily A Pratt, M D, Albany, N Y
(6) Progress in Mexico Through Health (illustrated) Rosalie Slaughter Morton, M D, New York City

Some of these papers are promised for publication in the *New York State Journal of Medicine*

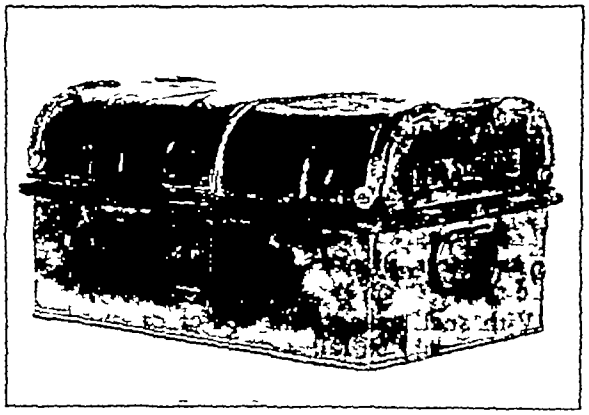
The officers of the society were as follows
President, Anna Harvey Voorhis, M D
Vice-Presidents Daisy M O Robinson, M D
Augusta Vedin, M D
Anne Hubert, M D
Treasurer Mary J Kazmjerczak, M D
Secretary Marion S Morse, M D, Endicott.

MEDICAL WARES

MEDICAL OUTFITS FOR EXPEDITIONS

Leaders of an exploring expedition must make provision for the medical treatment of its personnel While an expedition may not always be accompanied by a physician, it will always have an outfit or kit containing articles in common use for emergency treatments Those who accompany an expedition are chosen for their sound physical health and their considerate and mental attitude for the care of their health, and so they are not supposed to be subject to the ills or weaknesses that beset average mortals But they are exposed to vicissitudes of food and water, heat and cold, accidents and privations, deficient diet, and unaccustomed food, and there is sure to be need for treatment both medical and surgical An army of chosen men on a march with the best of medical attention will usually have a sick rate of about three per cent This rate may be expected on any expedition, either exploring or scientific

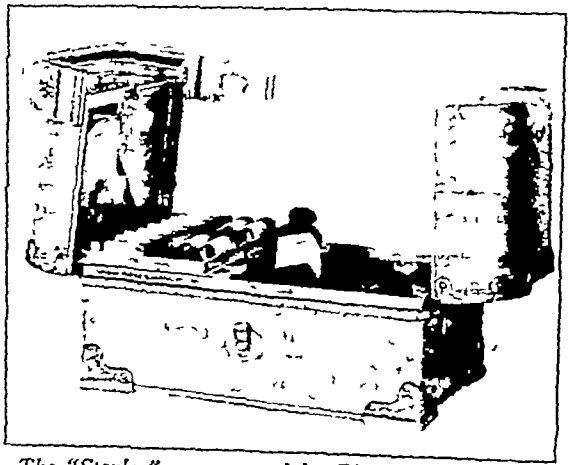
The medical outfit of an exploring expedition must meet at least three special requirements



1. The supplies must be in containers designed for easy portability They therefore must be chosen for their efficiency in common requirements, and not for an extended line of treatment such as would be given in the hospital

2 The articles will generally be chosen by men who are not physicians, but who are trained observers and are able to follow directions with understanding A medical outfit would be useless if it required the services of a trained surgeon

3 The remedies must be adapted to symptomatic treatment Only such conditions will be treated as are plainly evident, such for example, as nausea, stomach pains, intestinal disturbances, and superficial wounds The majority of these conditions will be safely treated by laymen of intelligence—and it must be remembered that the leaders of expeditions are men of extraordinary ability and judgment



Burroughs Wellcome & Company, an English firm whose branches encircle the earth, has specialized in medical outfits for explorers for over a half a century Its American office at 11 East 41st Street, has on view in its historical medical equipment exhibit a number of outfits used by famous explorers throughout the world

One of the exhibits is the medical case used by H M Stanley, in 1892, in equatorial Africa This case was looted by the Arabs and recaptured, and again stolen by the natives, and finally was recovered and today is in a condition fit to be used by another expedition This case is made of heavy metal and measures about 15 x 10 x 8½ inches, and still contains a variety of drugs and dressings, among them being mustard plasters, throat brushes, peptonizing tubes, menthol cones, and a roll of old-fashioned Meade's lead plaster, which is still as sticky as ever

Case Carried by H M Stanley in 1892.

The case used by Stanley has been adopted as a standard form by Burroughs Wellcome & Company, and its model may still be obtained at a price at about $175 It consists of a heavy metal case shaped like a trunk, whose top is separated in the middle and is hinged on each end The main part of the trunk contains about forty bottles of rubberoid composition so

The "Stanley" case carried by Theodore Roosevelt

BRONX COUNTY

A regular meeting of the Bronx County Medical Society was held at Concourse Plaza, on May 15, 1929, at 9 P M, the President, Dr Aranow, in the Chair

The following were elected to candidates for membership Drs Irwin Alters, Achille F Baratta, Max Berkowsky, George L Birnbaum, Leo Braun, Louis Brooks, David Hershkowitz, Edward F Kohrs, Samuel Lassman, Abraham Lieff, Charles Mandel, Morris A Mason, Dominick Gilbert Petix, David Rodier, Charles J Rudnick and Jacob Jackson Wechsler

Under New Business, the Secretary read the proposed Amendments, introduced at the April meeting, as follows

Section 11 (lines 14 and 15)—Strike out the words "Scientific Committee, consisting of the First and Second Vice-Presidents and Secretary," and insert instead

"Program Committee, consisting of a Chairman, the President of the Society and three other members"

Section 12 (line 2)—Strike out the words "the Scientific Committee"

Section 34—Strike out the last sentence reading "They (Vice-Presidents), together with the Secretary, shall constitute the Standing Committee on Scientific Communications, whose duties shall be to arrange the Scientific Programs for the Stated Meetings"

Add Section 81 (a) "PROGRAM COMMITTEE The Program Committee shall arrange the Programs for the Stated Meetings"

Section 7 (sixth line)—Change to read "They shall assume office July 1st."

Section 17—"The Annual Meeting of the Society shall be held on the third Wednesday of June"

Section 57—"Nominations for Officers, Delegates and Alternates shall be made at the Stated Meetings in April and May"

Section 82—"The Nominating Committee shall nominate a full set of officers and report at the April meeting of the Society"

Following the discussion it was moved and carried that the Amendments be accepted as read

In connection with the Report of the Committee on Medical Economics, the recommendations of the Comitia Minora were acted upon as follows

It was moved and carried that the delegates representing our society be instructed to urge, at the coming annual meeting of the Medical Society of the State of New York, the passage of a bill providing for the appointment of a physician on the Compensation Commission.

It was moved and carried that our delegates be instructed to urge, at the coming annual meeting of the State Society, the placing of an amendment to the Compensation Law empowering the injured employee to choose his own physician.

The Report of the Comitia Minora, recommending to the Society that the Committee on Hospitals be instructed to get in touch with all private and general hospitals and sanitariums in the Bronx, requesting that room and board be given free of charge to all physicians when they require hospital treatment, was then voted upon and approved by the Society

The recommendation of the Comitia Minora that the Bronx County Medical Society make formal request of the State Labor Department that it establish a Branch of the Compensation Commission in Bronx County, was upon motion approved In this connection it was suggested that we request the civic bodies of the Bronx to cooperate with us in the securing of this very desirable object This was also approved.

The President reported on a Conference on Diphtheria Prevention at the Department of Health At this Conference the matter of the family physician giving the toxin-antitoxin treatments was generally discussed The Department is very desirous of having the cooperation of the County Societies and the physicians in this regard

The following Resolutions were introduced

Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Jacob Aronson, M D

Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr Aronson and that a minute thereof be placed on the records of the Society and be it

Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member

The above Resolutions were carried by a rising vote

The Scientific Program then proceeded as follows

Papers

1 Thyrotoxicocis in Childhood Early Diagnosis and Radium Therapy, Solomon Ginsburg

2 A Clinical Review of the Diagnosis and Treatment of Goiter, Emil Goetsch

It was moved and carried that a vote of thanks be extended to the speakers of the evening

It was moved and carried that the Society express its sympathy to Dr George W Crile on the great disaster that has befallen the Cleveland Clinic Hospital

I J Landsman, M D, *Secretary*

THE DAILY PRESS

CAUSES OF CRIMINALITY

The *Syracuse Post Standard* of June 2 contains a review of a book entitled "Philosophy of the Dusk", by Cain O'Dare, which is the autobiography of a criminal The review says

"Guy Pearce Jones writes an introduction in which he tells of his first meeting with O'Dare five years ago At that time O'Dare told him that he had been a criminal because he liked it From the reading of the book one would conclude that in this remark O'Dare told the truth For the book is no record of wall shadows, or injured innocence, or self-pity

"There is an underworld, a world submerged, a world where habits and customs and the unwritten laws of conduct are one great whole, quite different from our world of respectability, morality, virtue and law In that world men and women live, love, indulge in pleasure and passion and greed, just as many do in our world That world pays us back for our pharisaism and hypocrisy and cant with curses or a 'ha-ha'

"There O'Dare lived Lived with prostitutes, thieves and all varieties of social outcasts He is a good reporter or a monumental liar The reviewer need not decide which Whoever O'Dare is or was, he has been a keen observer"

O'Dare probably told the truth Criminals indulge their favorite crime because they like to do so They do not want to reform They can see the ethics of wrong doing in others, but their own acts are moral, according to their own standards Their brains are different from those of other people Their acts are logical and reasonable, if the propriety of their foundation is admitted

CREDULITY

The newspapers of June 10 recorded the death of Mrs Mary Copley Thaw on June 9, in her home in Pittsburgh While most readers knew her only as the mother who defended her son against a charge of murder and insanity, yet she was well known in her own right The *New York Herald Tribune* of June 10 said

"Her father, a deeply religious man, grandson of John Singleton Copley, the American painter, was one of the pioneer editors of Western Pennsylvania

"Inheriting the religious disposition of her father, she assisted missionaries in India, China and Africa

"When crops failed in Nebraska in 1893, Mrs Thaw distributed seeds to the farmers through the clergy Reindeer were largely introduced into Alaska by Mrs Thaw, aided by Mrs Elliott F Shepard and Dr Sheldon Jackson, who brought over Laplanders to care for the animals until they were inured to the climate

"During the World War she sent many contributions to the impoverished European peoples

"During the influenza epidemic ten years ago she widely circulated eucalyptus as a preventive"

It was the distribution of Eucalyptus as a preventive of influenza that caught the editor's eye Doubtless the donor considered that as a major act of charity, but the mind of every person is a curious mixture of keenness and credulity It is to the credit of Mrs Thaw that she did not make money on the eucalyptus

PROFESSIONAL SECRETS

Physicians are not the only persons on whom is laid the obligation of secrecy of confidential communications That ministers of the gospel are under the same obligation is shown by Dr Cadman in the *New York Herald-Tribune* of June 10 A correspondent wrote

Upon the promise of a clergyman to keep the matter disclosed to him a secret between himself and God only, a woman confessed to him that she had killed her father Thereafter this clergyman went to the local authorities and revealed to them the confession thus made The outcome of this action on his part was a trial, which, however, resulted in the acquittal of the woman

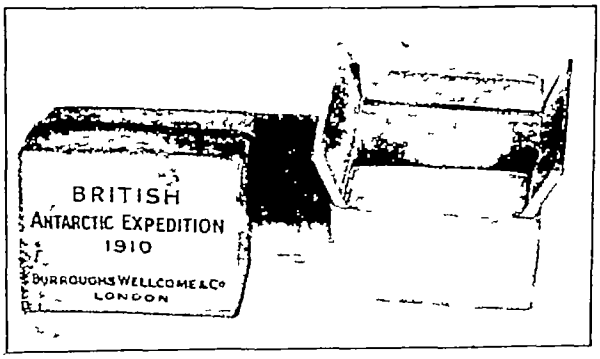
Was the clergyman in any way justified in revealing the information he obtained in this way to the police authorities in the interest of justice?"

Dr Cadman answered

"I recall the case to which you refer and also that the conduct of this minister was almost universally condemned Confidence intrusted to a clergyman by those who seek his spiritual direc-

that they are practically unbreakable Their stoppers are polished smooth so that they are airtight The two hinged tops contained bottles and also dressings such as bandages and lint.

The Company has on exhibition a Stanley case which was carried by Theodore Roosevelt on his African Expedition in 1910 Doctors will be interested in the contents which are still in the bottles



Fourteen of the bottles contain quinine sulphate, and three contain ipecac Warburg's tincture was also carried and tablets of lead and opium One bottle was labeled calomel and jalap and was called the Livingston rouser The other bottles contain the following drugs

Paregoric, aspirin, cascara, bismuth and soda, iron, arsenic, soda mints, aromatic chalk and opium, boric acid, potassium chloride, salol, ginger, antipyrine, potassium permanganate, tannin, calomel, asafetida, aconite, quinine, belladonna and camphor, kino, antifebrin, opium, trional, aloin compound, zinc sulphate, and bichloride of mercury tablets

There was also a hypodermic syringe, rubber catheters, pipettes, silver nitrate stick, and bandages

With such an outfit, a doctor or intelligent layman would be fairly well prepared to treat *the common injuries and sickness, which would* be likely to affect a troop of husky men Doubtless some narcotics, cocaine and morphine, were also contained in the box while it was in use

Another outfit was a pair of wooden boxes used by Algot Lange in 1911, on an exploring expedition up the Amazon River These

Case taken to the South Pole by Commodore Scott

boxes were rawhide covered, each containing fourteen bottles The boxes were about 15" x 9" x 5", and are called the Livingston medicine chest One of the boxes contains the iron head of a poisoned arrow which was shot into the box, presumably by a native

Another outfit is that of Commodore Scott who took it to the South Pole in 1910 on a dog sledge It was a cubical box of about six inch

Case carried by Algot Lange on the Amazon trip

per side, and was made of sheet cork and canvas It is probably of special make and designed for lightness as well as strength This box was discovered in the tent in which Commander Scott lost his life

Another case was one of tin which was used by Roy Andrews in 1915, in an expedition to Thibet Mr Andrews will be remembered as the leader of the Gobi Desert expedition on which dinosaur eggs were discovered after they had laid buried twenty million years

Case carried by Roy C Andrews in his expedition to Thibet

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them A selection from this column will be made for review, as dictated by their merits or in the interests of our readers

tion should be held by him as inviolable and sacred The exposure, detection and punishment of crime is the business of the law and the courts These respect the clerical position as I have stated it, and do not insist that pastors shall reveal secrets committed to them in the confessional

"Many clergymen would undoubtedly advise the wrongdoer to surrender himself or herself to the authorities, while others might not so advise Much depends upon the rules of various churches and the nature of the offense confessed Of course, if an innocent person were likely to suffer for the crime, any clergyman, as I understand it, is bound to prevent such a miscarriage of justice. Personally, I do not think the man to whom you refer was justified in disclosing the information he received after solemnly binding himself not to do so"

A VISIT TO THE DENTISTS

Why are the best jokes ascribed to the dentists?

The *Syracuse Post Standard* of June 2 contains the following gem, whose length could not be cut without impairing its interest

Little Benny and Pop at Dentists
By Lee Pape

"Aftr suppir yestidday I was in the living room holding one half of my face, and ma sed, Benny Potts, that tooth is herting agen, so dont start denying it before I even ask you Theres ony one thing to do and thats to go to the dentists the ferst thing tomorrow morning without fail or argewment, she sed

"Especially argewment, pop sed Theres nuthing more important than your teeth and if you take good care of them in your youth theyll take good care of you in your manhood he sed, and ma sed, And Willyum, this is a golden opportunity for you to go with him and have that extraction done, theres no use just waiting and waiting till more trubble sets in

"I intend to go next week for sure, pop sed, and I sed, No, sir, I aint going if you dont, pop, no sir

"Of course Im going, whats all the fuss about? pop sed We'll go rite around after brekfist and set each other a good example, he sed, and I sed, Well G, pop, if you wunt to put it off a week, Im willing

"But Im not, the ideer, ma sed, and pop sed, And neither am I, if a things werth doing, for Peet sake get it over with, thats my prize winning slogan

"And this morning at brekfist my tooth felt so much better it almost felt all rite agen, so I dident mention it, and pop dident mention his and dident look as if he was going to, and ma sed, I hope you brave men havent forgotten, this is the morning for the dentist

"Im well aware of the fact, pop sed, and I sed, G, ma, I know it And me and pop went around to Dr Climbers office and sat down in the waiting room, and we was the only 2 there, pop saying, Good, it our tern next, thats what I call starting the day rite

"And he started to look on the table for a magazine to reed, saying, By all the sines he's a good union dentist, there's not a magazine here thats not at least 6 munths old Wich just then somebody started to make fearse sounds in the next room as if something was herting them, such as their teeth, me saying, Well G, pop, I can still be erly for skool if you still feel like putting it off till next week, and pop sed, Well after all, skool is education and nuthing can take the place of education, but still, we're here now, and after all, now that we're here, here we are.

"Meening we mite as well stay Wich we kepp on doing, and after a wile Dr Climber stuck his hed out of the back room smiling as if he had never hert anybody all his life, saying, Good morning, Ill be rite with you

"Dont hurry, take your time, pop sed

"And we kepp on waiting, and pritty soon some even werse sounds came from the back room, me saying, G wizz pop, do you hear that?

"Why yes, I blleeve I do, pop sed And he took out his watch and looked at it, saying, As a matter of fact I have serverel important appointments today and I mite not be able to concentrate if I have that tooth extracted ferst But of corse I can leeve you here and you can explain to Dr Climber Ill be back late next week or erly the week after, wichever he prefers, he sed

"No sir, I should say not, G wizzickrs pop if you dont stay I wont, holey smokes, I sed But of corse if we both wawked out kind of easy without making much noise then we could both come back next week and explain to him then, I sed

"I see your point, but Im afraid that wouldent look very well, pop sed I think one of us awt to stay he sed looking at his watch agen Proving he still ment me, and I sed, Well I tell you, pop, lets toss up for it

"A father awtent to gamble with his sons teeth pop sed And he got up to go, and just then Dr Climber wawked out saying, Ill see you now, Mr Potts

"That fine, thats dandy, are you sure you have the time? pop sed

"Wich Dr Climber sed he had, and pop went in with him and made a few sounds but not very bad ones, and then I went in and he dident hardly hert me at all and I dident haff to go to skool till this afternoon, making me fell better insted of werse"

BOOK REVIEWS

A Text-Book of Pharmacology and Therapeutics By Hugh Alister McGuigan, Ph.D, M.D Octavo of 660 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928. Cloth, $6.00

Recently there have appeared several new works on Pharmacology and Therapeutics, and it has been this reviewer's privilege to comment enthusiastically regarding several of them. Now comes Dr McGuigan's excellent book—and whence come the new crop of adjectives that the work merits

As might have been expected of this author, this text-book is the product of a trained teacher Brief, accurate, scientific, amply illustrated, it closely approaches the ideal that many a teacher has hoped for The correlating of pharmacologic action to therapeutic application and the reason therefor, has been well done and will prove to be constructive reading for the therapist. Had the author had the courage to override the publisher and exclude from the text all reference to the obsolete Apothecaries' system of weights and measures, employing the Metric system only, this book might have been correctly called the *ideal* text-book. Why the medical student of today need be taught to use any but the Metric system, is beyond understanding

Here is an up-to-the-minute book that practitioners will be abundantly repaid in possessing

M. F DeL.

The Harvey Lectures Delivered Under the Auspices of the Harvey Society of New York, 1927-1928. Under the Patronage of the New York Academy of Medicine. By Dr. Edward Francis and others. Series XXIII. Octavo of 280 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1929 Cloth, $4.00.

The eight lectures given during 1927-28 under the auspices of the Harvey Society are the twenty-third series of these Lectures. The object of the Society is the "diffusion of scientific knowledge in selected chapters in anatomy, physiology, pathology, bacteriology, pharmacology, and physiological and pathological chemistry, through the medium of public lectures by men who are workers in the subjects presented."

The following articles are presented by masters of their subjects

A Summary of Present Knowledge of Tularemia.
The Relation of the Liver to Metabolism.
The Influence of Insulin and Epinephrine on the Fate of Sugar in the Animal Body
The Metabolism of Nerves.
The Treatment of Pernicious Anemia.
Experimental Fistulae of Blood Vessels.
The Renal Lesions in Bright's Disease.
The Development of the Harvean Circulation

Each paper is a masterpiece on the subject and will well repay a careful study

Henry M Moses.

A Compend of Diseases of the Skin By Jay Frank Schamberg, A.B, M.D Eighth Edition 12mo of 324 pages, illustrated. Philadelphia, P Blakiston's Son & Company, 1928. Cloth, $2.00. (Blakiston's Compends.)

Dr Schamberg's Compend of Diseases of the Skin, which he has brought up to date in this edition, continues to hold a place as a handy, easy readable text for the student and general practitioner

A. M Persky

Organic Laboratory Methods. By the Late Professor Lassar-Cohn Authorized translation from the general part of fifth revised edition, by Ralph E. Oesper, Ph.D Edited by Roger Adams and Hans T Clarke. Baltimore, The Williams & Wilkins Company, 1928 469 pages, illustrated 8vo Cloth, $6.50 (The World Wide Chemical Translation Series No 2. Edited by E. Emmet Reid)

This book is a translation of the author's first of his two volumes on "Arbeitsmethoden fur Organisch-Chemische Laboratorien" and deals with the following general subjects on laboratory technique: Distillation, Dialysis, Evaporation, Decolorizing and Clarifying Liquids Extraction, Melting Point Determination, Sublimation, Drying, Detection and Determination of Nitrogen, Halogens and Sulfur in Organic Compounds, as well as Ashing of Organic Materials These are some of the general topics. The author also considers numerous minor subjects in this field of work.

As the translator states, it outlines the methods by which difficulties have been overcome. The information presented in this volume will undoubtedly be appreciated by the organic chemist, who finds it difficult to read the same in German Although the translator makes no claims as to completeness, one reading this volume is impressed with the thoroughness with which so large a field is treated.

Silik H Polayes

Diseases of the Blood By A. Piney, M.D, Octavo of 195 pages, illustrated. Philadelphia, P Blakiston's Son & Company, 1928. Cloth, $4.00

This is a small volume of less than 200 pages amply illustrated and presented in clear, concise style.

A considerable effort has been made to describe and explain the underlying anatomical changes that occur in the hematopoietic organs.

Much of practical value is presented and in a manner that makes the reading interesting as well as instructive.

With the present day tendency of making routine blood examinations on all hospital patients and on many office patients, the practitioner has very frequent occasions to acquaint himself with different hematological diseases, their recognition and best methods of treatment.

This small volume should be of great assistance to the clinician as well as the laboratory worker

H. M. Feinblatt

Pediatrics for the General Practitioner. By Harry Monroe McClanahan, A.M., M D Octavo of 606 pages with 230 illustrations Philadelphia and London, J B Lippincott Company, 1929 Cloth, $6.00

In this book of 606 pages, the author in his preface says, the purpose of the book is "With the belief that sick infants and children are and will continue to be under the care of the family physician and that they have an inherent right to the best treatment that can be obtained, the author presents this book."

Typographically little is left to be desired, good paper good sized type and the many illustrations are above the average in clearness

For the general practitioner and the student, the book is highly recommended, as the descriptions are brief and to the point. Many individual cases are cited, illustrative of the subject under discussion.

Most controversial matters are omitted, with the result that the book is a sound exponent of the author's wide experience, and it will well fulfill the author's purpose.

A. D Smith

NOTES ON CHRONIC OTORRHOEA. With Especial Reference to the Use of Zinc Ionization in the Treatment of Selected Cases By A. R. FRIEL, M A., M.D Octavo of 87 pages, illustrated New York, William Wood & Company, 1929 Cloth, $2.25

A MANUAL OF HELMINTHOLOGY, MEDICAL AND VETERINARY By H. A. BAYLIS, M A., D Sc. Octavo of 303 pages, illustrated. New York, William Wood & Company, 1929 Cloth, $10 00

PROTOZOOLOGY A Manual for Medical Men By JOHN GORDON THOMSON, M.A., M B., Ch B., and ANDREW ROBERTSON, M B., Ch B Octavo of 376 pages, illustrated New York, William Wood & Company, 1929 Cloth, $11 00

PHYSICAL THERAPEUTIC TECHNIC. By FRANK BUTLER GRANGER, A.B., M D Octavo of 417 pages, illustrated. Philadelphia and London, W B Saunders Company, 1929 Cloth, $6 50

YOUTHFUL OLD AGE. How to Keep Young By WALTER M GALLICHAN 12mo of 236 pages New York, The Macmillan Company, 1929 Cloth, $2.50

OLD AGE THE MAJOR INVOLUTION The Physiology and Pathology of the Ageing Process By ALFRED SCOTT WARTHIN, Ph D., M D Octavo of 199 pages, illustrated New York, Paul B Hoeber, Inc., 1929 Cloth, $3 00

DEVILS, DRUGS, AND DOCTORS The Story of the Science of Healing from Medicine Man to Doctor By HOWARD W HAGGARD, M D Octavo of 405 pages, illustrated New York and London, Harper & Brothers, 1929 Cloth, $5 00

PROCTOLOGY A Treatise on the Malformations, Injuries and Diseases of the Rectum, Anus and Pelvic Colon By FRANK C YEOMANS, A.B., M D., F.A.C S Octavo of 661 pages, illustrated. New York and London, D Appleton & Company, 1929 Cloth, $12 00

A SHORTER SURGERY A Practical Manual for Senior Students By R J McNEILL LOVE, M B., M S (Lond.), F.R.C S (Eng.) Octavo of 299 pages, illustrated New York, William Wood & Company, 1929 Cloth, $4 00

DIAGNOSIS AND TREATMENT OF DEFORMITIES IN INFANCY AND EARLY CHILDHOOD By M F FORRESTER-BROWN, M.S., M D (Lond.) Octavo of 199 pages, illustrated New York, Oxford University Press, 1929 Cloth, $4 15 (Oxford Medical Publications)

NEPHRITIS Its Problems and Treatment By T IZOD BENNETT, M.D (London), F.R.C P Octavo of 94 pages New York, Oxford University Press, 1929 Cloth, $1 85 (Oxford Medical Publications)

HAEMORRHOIDS Their Aetiology, Prophylaxis and Treatment by Means of Injections By ARTHUR S MORLEY, F.R.C S., Eng Fourth Impression Octavo of 122 pages, illustrated New York, Oxford University Press, 1929 Cloth, $2 00 (Oxford Medical Publications)

THE PRINCIPLES OF CLINICAL PATHOLOGY IN PRACTICE. A Guide to the Interpretation of Laboratory Investigations for the Use of Those Engaged in the Practice of Medicine By GEOFFREY BOURNE, M D (Lond.), M.R.C.P., and KENNETH STONE, M D (Oxon.), M.R.C.P Octavo of 392 pages New York, Oxford University Press, 1929 Cloth, $4 75 (Oxford Medical Publications)

SURGICAL PATHOLOGY By WILLIAM BOYD, M.D Second Edition Octavo of 933 pages, illustrated. Philadelphia and London, W B Saunders Company, 1929 Cloth, $11 00

THE CYTOARCHITECTONICS OF THE HUMAN CEREBRAL CORTEX By CONSTANTIN VON ECONOMO. Translated by DR. S PARKER. Octavo of 186 pages, illustrated. New York, Oxford University Press, 1929 Cloth, $6.25 (Oxford Medical Publications)

OESOPHAGEAL OBSTRUCTION ITS PATHOLOGY, DIAGNOSIS AND TREATMENT [Based on the Jacksonian Prize Essay of the Royal College of Surgeons of England for 1924 (Published by Permission of the Council) and Including a Hunterian Lecture Delivered at the Royal College of Surgeons in 1926] By A. LAWRENCE ABEL, M S (Lond.) F.R.C S (Eng.) Quarto of 234 pages, illustrated New York, Oxford University Press, 1929 Cloth, $9 00 (Oxford Medical Publications)

THE INTERNATIONAL MEDICAL ANNUAL. A Year Book of Treatment and Practitioner's Index. Forty-seventh Year Octavo of 568 pages, illustrated. New York, William Wood & Company, 1929 Cloth, $6.00.

MEDICINE. Its Contribution to Civilization. By EDWARD B VEDDER, A.M., M.D Octavo of 398 pages Baltimore, The Williams & Wilkins Company, 1929 Cloth, $5 00

THE HEALTHY BABY The Care and Feeding of Infants in Sickness and in Health. By ROGER H DENNETT, B S., M D New Edition. 12mo of 266 pages New York, The Macmillan Company, 1929 Cloth, $1.25

EDEMA AND ITS TREATMENT By HERMAN ELWYN, M.D Octavo of 182 pages New York, The Macmillan Company, 1929 Cloth, $2.50

DIAGNOSTIC METHODS AND INTERPRETATIONS IN INTERNAL MEDICINE. By SAMUEL A. LOEWENBERG, M.D Octavo of 1032 pages, illustrated. Philadelphia, F A. Davis Company, 1929 Cloth, $10 00

REFLECTIONS AND OPERATIONS By SIR JOHN O'CONNOR, K.B.E., M A., M D Octavo of 361 pages. London, Bailliere, Tindall & Cox, 1929 Cloth, 21/

PRACTICAL CHIROPODY By E. G V RUNTING, F I S Ch. Third Edition 12mo of 200 pages. St. Louis, The C V Mosby Company, 1929 Cloth, $3 00

THE TONSILS AND ADENOIDS AND THEIR DISEASES Including the Part They Play in Systemic Diseases. By IRWIN MOORE, M B., C.M (Edin.) Octavo of 395 pages, illustrated St. Louis, The C V Mosby Company, 1928. Cloth, $6.50

DISEASES OF THE THYROID GLAND By ARTHUR E. HERTZLER, M D Second Edition. Octavo of 286 pages, illustrated St Louis, The C. V Mosby Company, 1929 Cloth, $7 50

DISEASES AND DEFORMITIES OF THE SPINE AND THORAX By ARTHUR STEINDLER, M D Quarto of 573 pages, illustrated St Louis, The C V Mosby Company, 1929 Cloth, $12 50

PROGRESSIVE RELAXATION A Physiological and Clinical Investigation of Muscular States and Their Significance in Psychology and Medical Practice. By EDMUND JACOBSON, A.M., Ph.D., M D Octavo of 429 pages, illustrated Chicago, The University of Chicago Press, 1929 Cloth, $5 00

A MANUAL OF DISEASES OF THE NOSE, THROAT, AND EAR. By E. B GLEASON, M D Sixth Edition. 12mo of 617 pages, illustrated. Philadelphia and London, W B Saunders Company, 1929 Cloth, $4.50

TWEEDY'S PRACTICAL OBSTETRICS Edited and largely rewritten by BETHEL SOLOMONS, M D Sixth Edition. Octavo of 759 pages, illustrated. New York, Oxford University Press, 1929 Cloth, $7.50 (Oxford Medical Publications)

BOOK REVIEWS

A Text-Book of Pharmacology and Therapeutics By Hugh Alister McGuigan, Ph.D, M D Octavo of 660 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928. Cloth, $6 00

Recently there have appeared several new works on Pharmacology and Therapeutics, and it has been this reviewer's privilege to comment enthusiastically regarding several of them. Now comes Dr McGuigan's excellent book—and whence come the new crop of adjectives that the work merits

As might have been expected of this author, this text-book is the product of a trained teacher Brief, accurate, scientific, amply illustrated, it closely approaches the ideal that many a teacher has hoped for The correlating of pharmacologic action to therapeutic application and the reason therefor, has been well done and will prove to be constructive reading for the therapist. Had the author had the courage to override the publisher and exclude from the text all reference to the obsolete Apothecaries' system of weights and measures, employing the Metric system only, this book might have been correctly called the *ideal* text-book. Why the medical student of today need be taught to use any but the Metric system, is beyond understanding

A Compend of Diseases of the Skin By Jay Frank Schamberg, A.B., M.D Eighth Edition 12mo of 324 pages, illustrated. Philadelphia, P Blakiston's Son & Company, 1928. Cloth, $2 00 (Blakiston's Compends.)

Dr Schamberg's Compend of Diseases of the Skin, which he has brought up to date in this edition, continues to hold a place as a handy, easy readable text for the student and general practitioner

A. M Persky

Organic Laboratory Methods. By the Late Professor Lassar-Cohn Authorized translation from the general part of fifth revised edition, by Ralph E. Oesper, Ph.D Edited by Roger Adams and Hans T Clarke. Baltimore, The Williams & Wilkins Company, 1928 469 pages, illustrated 8vo Cloth, $6 50 (The World Wide Chemical Translation Series No 2. Edited by E. Emmet Reid)

This book is a translation of the author's first of his two volumes on "Arbeitsmethoden fur Organisch-Chemische Laboratorien" and deals with the following general subjects on laboratory technique Distillation, Dialysis, Evaporation, Decolorizing and Clarifying Liquids Extraction, Melting Point Determination, Sublimation, Drying, Detection and Determination of Nitrogen, Halogens and Sulfur in Organic Compounds, as well as Ashing of Organic Materials. These are some of the general topics. The author also considers numerous minor subjects in this field of work.

As the translator states, it outlines the methods by which difficulties have been overcome. The information presented in this volume will undoubtedly be appreciated by the organic chemist, who finds it difficult to read the same in German Although the translator makes no claims as to completeness, one reading this volume is impressed with the thoroughness with which so large a field is treated.

Silik H. Polayes

Diseases of the Blood By A. Piney, M.D, Octavo of 195 pages, illustrated. Philadelphia, P Blakiston's Son & Company, 1928. Cloth, $4 00

This is a small volume of less than 200 pages amply illustrated and presented in clear, concise style.

A considerable effort has been made to describe and explain the underlying anatomical changes that occur in the hematopoietic organs.

Much of practical value is presented and in a manner that makes the reading interesting as well as instructive.

With the present day tendency of making routine blood examinations on all hospital patients and on many office patients, the practitioner has very frequent occasions to acquaint himself with different hematological diseases, their recognition and best methods of treatment.

This small volume should be of great assistance to the clinician as well as the laboratory worker

H. M Feinblatt

Pediatrics for the General Practitioner. By Harry Monroe McClanahan, A.M., M.D Octavo of 606 pages with 230 illustrations Philadelphia and London, J B Lippincott Company, 1929 Cloth, $6 00

In this book of 606 pages, the author in his preface says, the purpose of the book is "With the belief that sick infants and children are and will continue to be under the care of the family physician and that they have an inherent right to the best treatment that can be obtained, the author presents this book."

Typographically little is left to be desired, good paper good sized type and the many illustrations are above the average in clearness

For the general practitioner and the student, the book is highly recommended, as the descriptions are brief and to the point. Many individual cases are cited, illustrative of the subject under discussion

Most controversial matters are omitted, with the result that the book is a sound exponent of the author's wide experience, and it will well fulfill the author's purpose.

A. D Smith

THE INFANT AND YOUNG CHILD ITS CARE AND FEEDING FROM BIRTH UNTIL SCHOOL AGE. A Manual for Mothers By JOHN LOVETT MORSE, A.M., M.D., EDWIN T WYMAN, M.D., and LEWIS WEBB HILL, M.D., Second edition, revised. 12mo of 299 pages, illustrated Philadelphia and London, W B Saunders Company, 1929 Cloth, $2.00

When a book has been written by Dr Morse and his associates we can feel assured that it is a reliable guide, and that is very true in the present instance. Further, in these wild and rapid times it is refreshing to see people hold with conviction to old fashioned conservatism We feel gratified at the attitude taken toward wind and weather, catching cold, clothing and many such things

If one wishes to approach the more modern methods of generous feeding of small infants to the degree which even the conservative reviewer does, he will get no consolation from and had better not advise this book for his patients, as the writers are extremely tardy in bestowing the kinds of food which now are commonly given Perhaps they are right that the babies fed in the more stingy fashion of a half generation ago did as well as these with whose stomachs we take more liberty

Any criticism we might offer would be in detail rather than on major consideration

The reviewer actively disapproves of the routine nasal toilet and wonders whether the recommendation for a fine-tooth comb and the daily washing of scalp is the result of careful consideration or is simply a tradition held over from ancient times The use of bands to the age of ten years or their recommendation to that age seems somewhat superfluous However the unnecessary precautions offered do no harm if reasonably interpreted

It is safe to recommend the book.

WALTER D LUDLUM

PATHOLOGY FOR STUDENTS AND PRACTITIONERS Authorized translation of the Lehrbuch der Pathologischen Anatomie by DR. EDWARD KAUFMANN Translated by STANLEY P REIMANN, M.D Octavo of three volumes containing 2452 pages, with 1072 illustrations Philadelphia, P Blakiston's Son & Company, 1929 Cloth, $30.00

To those familiar with the German edition of Kaufmann's Pathology it is unnecessary to say that it is standard and one of the best works on the subject extant. English readers may well be congratulated on having an excellent translation of the book by so able a Pathologist as Prof Stanley P Riemann, M.D., of the University of Pennsylvania The translator, while preserving the general arrangement of the subject matter, has wisely made some additions of his own, as well as alterations to meet requirements since the author's death. Unlike Mac Callum's text book, this is not so much of a philosophy of pathology as it is a work adapted to the every-day necessities of the student and physician Both the original and translation are scholarly performances and reliable in every respect We owe a debt of thanks to Prof Reimann for a very real service, and we fully appreciate the vast amount of labor he has so well expended in a field of medicine which has become a daily necessity

The three volumes contain 2,452 pages and many illustrations Organic lesions are treated in systems and cover everything one could wish to know The appendix contains a full literature by both Kaufmann and the translator The index is full and bound with each volume, which is indeed a great convenience Thirty dollars seems a good price to pay for a work on pathology, but it is a small sum compared with what this book has to give in a form that can be readily utilized at short notice. The work is bound to see many new editions

J M VAN COTT

A TEXT-BOOK OF MEDICINE. By various authors Edited by J J CONYBEARE, M.C., M.D (Oxon.), F.R.C.P Octavo of 976 pages New York, William Wood and Company, 1929 Cloth, $8.00

A well written textbook of medicine which presents our essential knowledge down to this year of grace. Unlike some British textbooks, it can be used by American practitioners to complete advantage. Such diseases of the skin as the physician is likely to encounter are discussed, and the diseases of infancy receive separate consideration. An appendix deals with life insurance examination The readableness of this book and the extraordinary conciseness of its text will make it very popular with practical men Ingenuity in printing methods has enabled the publishers to get an unwonted amount of material into remarkably small compass A most serviceable work for busy men A. C. J

A DOCTOR'S LETTERS TO EXPECTANT PARENTS By FRANK HOWARD RICHARDSON, M.D Octavo of 118 pages New York, "Children—The Parents' Magazine," and W W Norton & Company, Inc., 1929 Cloth, $1.75

At the present time, an expectant mother, who is properly cared for, keeps close to her doctor and gets specific advice from him and so far as the physical is concerned Dr Richardson's book approves this course and recommends it.

A very large share of the book is devoted to the psychology of the Parents-to-be during that stage and in preparation for the coming of their little one. The advice given is comforting and assuring and the reviewer believes that prospective parents would get comfort and a reasonable amount of advice from this book.

It is interestingly written and attractive.

W D L.

AN INTRODUCTION TO THE HISTORY OF MEDICINE, with Medical Chronology, Suggestion for Study and Bibliographic Data. By Fielding H Garrison, A.B., M.D Fourth Edition Octavo of 996 pages, illustrated Philadelphia and London, W B Saunders Company, 1929 Cloth, $12.00

Dr Garrison is one of the few authors of medical books who makes it a simple matter to review a new edition without the need of studying the earlier ones The preceding (third) edition was issued in 1921, so that eight additional years' developments are included in the present. The author devotes nearly seven pages of preface to the new edition, in place of the customary perfunctory notice. The first edition dates from 1913-4, with two successive printings, the first revised edition was issued in 1917, and the second revision, dated 1921, was reprinted in 1924 The present is therefore the third revision "Garrison" is unique in conception and execution and its exhaustiveness vies with its originality Such a work must have a few defects of its qualities for it is hard to locate a reference on a given page which contains so many names One whose duties tend to keep him in touch with the latest developments of medicine may complain of certain omissions but always with the feeling that Dr Garrison and his colleagues have made these omissions intentionally We have in mind especially such innovations as the anti-allergic chamber of a group of Dutch physicians for the treatment of allergic respiratory diseases, and the work of Frei and others on a new form of lymphadenitis of the groins confounded for years with chancroidal bubo but distinguished by skin and bacteriological tests We note that Dr Garrison touches very lightly on certain alleged innovations, notably the Voronoff-Steinach rejuvenation and buccal focal infection, and are thus disposed to conclude that various other omissions are due to mature deliberation and not to oversight

A C J

RECENT ADVANCES IN BACTERIOLOGY AND THE STUDY OF THE INFECTIONS. By J HENRY DIBLE. Octavo of 363 pages, with 22 illustrations Philadelphia, P Blakiston's Son & Company, 1929 Cloth, $3 50

This is the most interesting little volume, one of great value to the Medical bacteriologist and physician. In a remarkably clear and concise manner, the author presents the present status of each mooted problem in this field. Unusual discrimination has been exercised in the selection of the material, and judgment expressed that is both appealing and convincing Special mention of the consideration of the classification of bacteria, the streptococcus problem, bacteriophage, spirochatae and immunity must be made. Too much commendation cannot be expressed regarding the excellency in compiling a work, the complexities of which has been presented in such simple and complete form

MAX LEDERER.

THE STORY OF MODERN PREVENTIVE MEDICINE. Being a Continuation of the Evolution of Preventive Medicine, 1927 By SIR ARTHUR NEWSHOLME, K.C B, M D 12mo of 295 pages. Baltimore, The Williams and Wilkins Company, 1929 Cloth, $4 00

This book is a continuation of the "Evolution of Preventive Medicine," published in 1927 by the same author

The previous volume was concerned with the possibilities of prevention of disease up to the middle of the nineteenth century In the present book, this sketch is continued through the modern period ushered in by Louis Pasteur's work.

Evidently, as the author remarks, the story is in outline only and is elementary The complete record would, as we know, require many volumes

This publication by Sir Arthur Newsholme fills an evident need in medical literature, in helping to acquaint the modern world with the great strides that medicine has made in the past fifty years

JOSEPH C. REGAN

A HANDBOOK OF CLINICAL CHEMICAL PATHOLOGY By FRANK SCOTT FOWWEATHER, M.D 12mo of 216 pages, with 18 illustrations. Philadelphia, P Blakiston's Son & Company, 1929 Cloth, $3 00.

This is a small volume of about 200 pages with a foreword by Sir Moynihan and fifteen chapter divisions

One cannot over-emphasize the importance of this type of book as an aid to the practitioner

The author has made the book informative and yet has been very concise and has omitted all detailed laboratory tests.

The subjects considered are Acid-base equilibrium, Renal function, Liver function, Toxemia of pregnancy, Tests of gastric function, Investigation of pancreatic and intestinal conditions, tests on Cerebro-spinal fluid, Basal metabolism, Anoxemia, Gout, Changes in Cholesterol, phosphorus, calcium in blood-tetany, rickets, Ossification, calcification, calculous formation, Vitamines and Deficiency diseases.

H M FEINBLATT

METHODS AND PROBLEMS OF MEDICAL EDUCATION (Eleventh Series.) Quarto of 263 pages, illustrated. New York, Division of Medical Education, The Rockefeller Foundation, 1928.

The eleventh series of the Rockefeller Brochures is, as usual, devoted to clinical teaching here and abroad. Out patient clinics, laboratories, teaching units for pediatrics, gynecology and obstetrics, and medicine are described with full floor plans and fine illustrations The book is valuable to those who are considering medical changes in their teaching methods and equipment.

C. A. G

DISEASES OF THE NERVOUS SYSTEM. A Text-book of Neurology and Psychiatry By SMITH ELY JELLIFFE, M.D, Ph D, and WILLIAM A. WHITE, M D Fifth Edition Octavo of 1174 pages, illustrated. Philadelphia, Lea and Febiger, 1929 Cloth, $9.50

The 5th edition of the well known text-book stands out as a notable contribution to neurology It is not simply a text-book, but an actual work of scientific accomplishment which could be used to great advantage by the physician in general and by the specialist in particular That is true in spite of a few errors, which to the reviewer's mind could have been omitted, if the authors were not so anxious to give us an expose of their pet theories For example, the authors show a great inclination to accept as proven facts, theories which are not only debatable, but actually far from being scientifically correct. We will refer here to the chapter on the "Physio-Chemical System." The classification of the material is also far from being up to the present standard and the reviewer believes that the classification of neurological conditions is more fortunate if one follows the system adopted by the New York Neurological Institute. It also seems that in the discussion of the problem of heredity, the authors have overlooked many important facts The reviewer had the impression that the authors were treading on uncertain ground. In the chapter dealing with psychoneurosis, the authors have overlooked the plausible theories of Jaensch, Klages, Hoffman and others

It is immaterial whether the reader agrees or not with the authors, they have looked at the problems from the one sided viewpoint of the psychoanalyst. They have fallen into the same pitfalls as all the psychoanalysts have, by attempting to deal with questions like multiple sclerosis, Parkinson syndromes, and epilepsies from the psychoanalytic standpoint. How psychoanalysis would restore destroyed axis cylinders, is a question which the reviewer cannot grasp However, we should not forget that the book is an American product, and the Freudians are in the ascendency It is regrettable.

Leaving this criticism aside, and examining the book, we believe that it is a work far surpassing any similar work in the present American medical literature. No one interested in the subject should be without it.

L. GRIMBERG.

THE PRACTICAL MEDICINE SERIES Comprising Eight Volumes on the Year's Progress in Medicine and Surgery Series 1928. Chicago, The Year Book Publishers, 1928 General Medicine. Edited by GEORGE H. WEAVER, M.D., and others 12mo of 832 pages, illustrated. Cloth, $3 00

This 1928 year book of the Practical Medicine Series on General Medicine follows the plan of previous years in presenting abstracts of important papers on medical subjects published during 1928. Medical conditions are divided into Departments of Infectious Diseases

Diseases of the Chest (excepting the heart)

Diseases of the Blood Making Organs Diseases of the Kidney

Diseases of the Heart and Blood Vessels

Diseases of the Digestive System and Metabolism.

The field of general medicine is carefully reviewed. Especial note is made of the importance of Rabies and its prevention, of Malta Fever and Tularemia. Diphtheria and its methods of prevention are reprieved. A report, p. 152, is made of the recovery of a patient with pneumococcus meningitis, this is of interest. The activity of the medical workers in pneumonia, tuberculosis, cardiac conditions, anemia and metabolism is shown in reports of the different Sections. Much benefit can be obtained in this year's book by study and reference to the topic under consideration HENRY M MOSES.

OUR NEIGHBORS

COUNCILOR DISTRICT MEETINGS

New York physicians have become so accustomed to District Branch meetings that they will wonder why similar meetings have not been instituted in the nine District Branches, or Councilor Districts, into which the State of California is divided The May issue of *California and Western Medicine* argues editorially for district meetings, after calling attention to the great distance which many doctors had to travel to reach the annual state meeting in San Diego, May 6-9 The editorial says

"If other states of far lesser geographical extent, in order to better coordinate organization activities find it advantageous to have councilor district societies of their state medical associations, it might seem equally or more desirable for a state as large and diverse as California also to have such district associations

"Is it proper to ask ourselves whether the time has not arrived when a councilor district society could be contemplated and perhaps organized in almost every councilor district of California? Such councilor districts are made up of county medical units in such comparatively close geographical proximity that semiannual sessions (the county units perhaps waiving meetings in those two months) would work very little hardship

"To vary the routine, and for the advantages that would come through other contacts, two or three of such councilor district societies, in every second or third year could join forces and in lieu of one of their meetings, put over a joint meeting, which would still further widen the influence, and create a greater solidarity and interest among members of the profession having closely related and interlocking public health and other problems

"The advantages of councilor district organizations are many Such councilor organizations bring together the officers of the different county units, and the good work of one county society becomes a stimulus for more aggressive activity in other county societies of the district In similar fashion, colleagues from one county through such councilor district organizations, have an opportunity to meet other colleagues having somewhat similar professional problems of scientific, social welfare, or economic nature And last, but not least, such district organizations make it possible for that large number of colleagues who find it very difficult to leave their practices for three to six days at a time, to attend the annual sessions of the state association, to meet and reap the joy and benefits which come through meeting colleagues who otherwise would be most infrequently seen

"If such councilor district societies were formed it would not be necessary for group county organizations like the Southern California, the Sacramento, or San Joaquin societies to disband These could hold their meetings once or twice a year, as now, and act practically as section societies covering a geographical domain as large as might seem desirable.

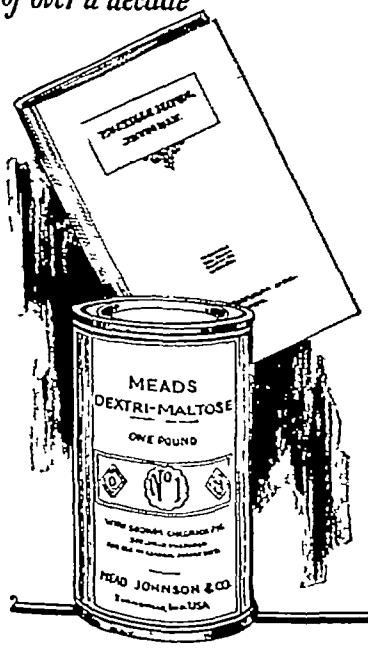
"A simple mode of organization could be worked out by the Council as a working basis for the inauguration of the different councilor district societies, until such time as experience pointed out desirable modifications"

MEDICAL AMENITIES

Just to show how medical amenities are observed in Texas, the following quotations are copied from the editorial pages of the May issue of the *Texas State Journal of Medicine* —

"Last month, in discussing a regrettable phase of our public health efforts, we had occasion to quote Ex-Governor Ferguson, well, if not favorably, known to all of our readers We know better than to engage in a controversy with a man of this type A tirade of his was quoted because it illustrated our point Now comes to our attention an additional spasm of the same sort It occurred in an editorial in the publication Mr Ferguson gets out, when he deems conditions propitious, politically and financially First, let us refer briefly, very briefly, to some of the outstanding charges in this editorial

"If any of the 'political doctors' and 'political liars' complained of Mr Ferguson's preachment, as he charges, we do not know of it Certainly our reference to the matter occurred after the editorial appeared And if any members of the State Medical Association, to which, we presume, he applies the term 'Medical Trust,' charged that Mr Ferguson had been paid anything for writing his article, or 'dared him to run for office again,' we do not know of that. We rather fancy



(Continued on page 778—adv xiv)

CONSTIPATION

"The substitution of one of the maltose-dextrins mixtures for milk or cane sugar also sometimes relieves constipation in little babies.*** Those preparations which contain the potassium salts are apparently somewhat more laxative than those containing the sodium salts."

MEAD'S DEXTRI-MALTOSE

From Text Books of over a decade

MEAD'S DEXTRI-MALTOSE No 3 (with potassium bicarbonate) is indicated for constipated babies Potassium salts added to cow's milk cause the formation of a soft coagula and softer stools

In human milk there is a preponderance of potassium over calcium salts, while calcium salts predominate in cow's milk The calcium in cow's milk tends to cause the formation of large tough curds in which are enveloped large quantities of fat

Sufficient potassium salts tend to overcome the preponderance of calcium resulting in a soft flocculent curd By freeing the fat from its envelope of casein, it comes in more intimate contact with the digestive juices resulting in a better metabolism and softer stools

THE MEAD POLICY

MEAD'S INFANT DIET MATERIALS *are advertised only to physicians No feeding directions accompany trade packages Information in regard to feeding is supplied to the mother by written instructions from her doctor, who changes the feedings from time to time to meet the nutritional requirements of the growing infant Literature furnished only to physicians*

(Continued from page 778—adv xiv)

be forgotten that when we go to passing laws on any particular subject, that the financial interest of those who want to make money out of the subject matter of legislation is of secondary importance to the good of the public and the rights of the individual

"The medical trust doctors care nothing about the practice of any kind of physical treatment except as it may effect them financially

"This is a broad statement and I am anxious to prove it.

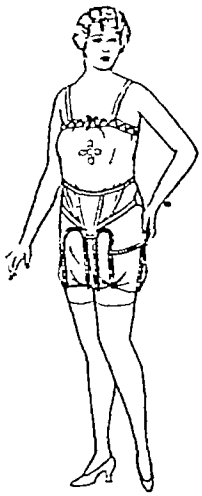
"Article, 4504 of the bill now being urged in the legislature by the medical trust provided as follows 'Nothing in this law shall be so construed as to discriminate against any particular school of medical practice, nor to affect or limit in any way the application or use of the principles, tenets or teachings of any church in the administration to the sick or suffering by prayer, without the use of any drug or material remedy, provided sanitary and quarantine laws and regulations are complied with,' and that no charge is made therefore, directly or indirectly

"In other words they say, let the public have all the chiropractors, Christian scientists and any other kind of a doctor they want, but we, the self-appointed and self-anointed, are the only crowd that is to be allowed to make any money out of human infirmity, and everybody else must work free

"From the standpoint of the public and of justice and fair play, it would be just as consistent for the Christian scientist to ask the passage of law providing that the pill doctor and appendix hunter could not charge for his services, as it is to let the pill doctor and appendix hunter have his law to keep the Christian Scientist from receiving pay for his services

"Verily, verily, 'money is the root of all evil' and if you take the almighty dollar out of this row the medical trust doctors will have no further interest in the dear public.

"I am reliably informed that many, many of these medicine doctors are letting the drug stores pay for their telephones to order drugs from their drug stores, of course It is also charged that many of them are getting a commission on the prescription written by them on blanks furnished by certain drug stores It is certainly a fine crowd to be talking about ethics 'ain't it'?"



The physicians of New York State believe that these methods of accusations and counter charges had best be omitted from State Journals

LOCAL NEWSPAPER PUBLICITY

The physicians of New Jersey are prominent among those of the Eastern States in their efforts to carry medical publicity to the people. (See

that the medical profession pays no attention to him, either as to his editorials or politics

"Of course, the medical profession is making no war, either 'holy or unholy,' on any school of medicine We will join Mr Ferguson in condemning that sort of thing As a matter of fact, and he knows it, all of the schools of medicine at present represented in Texas, which make any pretense at scientific education, are in support of the very measures so violently if not profanely condemned by Mr Ferguson All of these schools are represented on the present board of medical examiners, and one of them professes not to administer medicines of any sort, but relies on physical means of treatment And in our efforts the welfare of the medical profession is given a rating entirely secondary to the interests of the public health, which we profess to serve and, of course, which Mr Ferguson is sure we are not trying to serve"

The *Texas Journal* then prints an article written by Ex-Governor Ferguson for the *Ferguson Forum* of February 28, as follows —

"Since the appearance of my article last week on the medical trust and political doctors in Texas, the political liar has resumed business and the calomel and dovers powder pill rolling crowd are now raising the cry of Fergusonism

"Afraid to have the light turned on this political machine, that wants to control politics, one or two of the medical trust crowd have sneeringly asked how much Jim Ferguson was paid to write last week's article. Another one has cried out that he dares me to run for office again so the State Medical Association can show the people of Texas how little Jim Ferguson amounts to

"I have heard these yells before and if these medical trust doctors will just continue to dodge the issue by crying Fergusonism, they will show to the people better than I can that the state medical crowd are really in politics

"It is not my intention to ever run for office again, but if I do, I will not let this crowd intimidate me and I shall give them the hottest scrap they have yet had in Texas

"There is no use in this pill rolling crowd getting so huffy because somebody may call attention to some of their high-handed methods I, nor anybody else, am not making any war on their school of medicine or treatment of human ills, but what we want to do is stop their unholy war on somebody else who wants to receive other kinds of treatment from a different kind of practitioner satisfactory to them

"This aggregation of cutters and physicers appear to have overlooked the public and the rights of the individual altogether It must not

few years ago an effort was made to displace Dr King and at that time we felt, and so stated in the *Journal,* that we thought there was no good and sufficient reason for removing him. There is no reason why Dr King should be fighting more or less constantly to save his official hide, and he would not be on the anxious seat if he ceased to 'rub the fur the wrong way at the wrong time.' He justly merits the unfriendliness and even antagonism of many prominent medical men in Indiana because of his failure to seek more often the advice, counsel and support of the medical profession, and to listen to some very wise counsel of his friends

"We do believe that the governor ought to appoint as members of the State Board of Health some prominent, well-balanced medical men who have and merit the respect and confidence of the general medical profession of the state, and with the distinct understanding that while Dr King is not to be curbed in any of his efficient and progressive methods already put into effect, he must be guided by his board and, as a purely personal suggestion to Dr King himself, we suggest that he assume a more friendly attitude toward the medical profession as a whole and give respectful attention to constructive criticism We believe, as we have stated before in the *Journal,* that there should be a closer affiliation between the Indiana State Medical Association and the State Board of Health, the medical department of the University, and the State Board of Medical Registration and Examination All of these organizations ought to work in friendly cooperation"

SUMMER CLINICS IN TEXAS

The State Medical Association of Texas is promoting free teaching clinics for the benefit of its members The plan is described as follows in the *Texas State Journal of Medicine* for May —

"Again we present, with editorial prominence, the programs of our regular summer clinics It will be recalled by most of our readers, that some years ago the State Medical Association, after carefully considering the matter, decided that one of the most promising steps it could take in its efforts to keep the medical profession of Texas up-to-date, was to establish regular courses of clinics at home, available both in the

HORLICK'S

(*Continued from page 779—adv xv*)

this JOURNAL May 1, 1929, page 566) The May number of the *Journal of the Medical Society of New Jersey* contains an editorial regarding the attitude of physicians to medical advertisements in newspapers, which says

'Is there any reasonable hope of influencing newspapers toward refusal of advertising matter that is demonstrably fraudulent in character? Every physician must have been impressed by the advertising campaign conducted by *nostrum* manufacturers during the past winter months when a nationwide epidemic of influenza was threatened While our public health departments were warning against undue exposure to infection, and the papers were printing these warnings together with advice as to preventive measures, the same daily papers were carrying in their advertising columns most ridiculous claims as to the potency of substances never before recommended for prevention or treatment of that disease

"Some good may be accomplished by having the county societies deal directly with the papers in their respective territories As a general proposition, newspaper owners and managers are 'out to make money' and seem to care little about the honesty of their advertisers Nevertheless, they all are to some degree susceptible to public opinion and, particularly in the smaller cities and towns, public opinion can be brought to bear upon those responsible for a paper's management

"Publications of national import are not easily affected, the management cares little about the opinion of one or a dozen subscribers County papers must care a great deal more about the opinions of individual subscribers, and especially about the support of groups of citizens influential in the radius of their circulation The members of a county medical society can do much in the way of influencing public opinion, can possibly do something in the line of influencing editors and advertising managers of local papers, without even the threat of public action We would like to see the experiment tried"

THE HEALTH COMMISSIONER OF INDIANA

The *Journal of the Indiana State Medical Association* for May 15th has the following caustic comment on the Secretary of the Indiana State Board of Health

"Much has been said in the newspapers concerning the probability that Governor Leslie will ask for the resignation of Dr W F King as secretary of the State Board of Health. Up to this writing Dr King remains in office, and so far as we know has not been asked to resign A

in an important public service Nearly all the hospitals in Boston and the Forsyth Dental Infirmary conducted exercises presided over by experts in these various fields, where the varieties of cancer were exhibited and the treatments demonstrated.

"The banquet at the Hotel Somerset drew an attendance which filled the banquet room and was an inspiring occasion for the reports of clinics, the work at the Pondville Hospital and statistics of work done in Massachusetts which show that the percentage of cases of cancer are large made a deep impression on those present

"At the Boston City Club luncheon meeting the Canti film was exhibited which shows, at first under low power, later under a high degree of magnification, the actual processes of growth and reproduction in living cells cultivated from the periosteum of the fowl embryo, and in contrast, the cell activities in tissue from a rat sarcoma The normal cells appear in various forms, sometimes in the process of mitosis, always in what is apparently their usual state of intense activity As the cells from the Jensen rat sarcoma are thrown on the screen, the points of differentiation of these and the normal cells are seen to be few, but they are nevertheless distinct. The cytoplasm is more granular and these cells have long finger-like projections, which, as is quite evident in their behavior, have a definitely phagocytic function

Toward the end of the film the action of irradiation is brought out. Within twenty minutes after the application of radium emanation all motion among the cells has ceased This happens alike with the normal cells and with the sarcoma cells, but in the latter the destruction appears to be more complete This observation has been interpreted as lending support to the theory that radium has a selective action with relation to the cells of a malignant tumor"

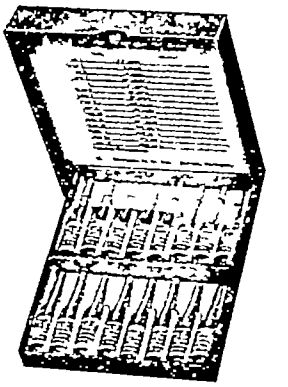
CRIPPLED CHILDREN IN OKLAHOMA

The Committee on Crippled Children of the Oklahoma State Medical Association made the following report, which was printed in the May *Journal* of the Association —

"The Committee met officially October 28, 1928, and passed upon the following

"The purpose of the Committee shall be,

"1 To study the problems which concern the medical profession in respect to the care of crippled children.



"2 To recommend and pass judgment upon procedures of the Oklahoma State Society for the care of crippled children so far as such measures relate to the medical profession

Hay Fever Time Is Here

Now is the time to prepare for HAY FEVER treatments Among your patients there are probably many who need and demand this preventative against the onslaught of this condition We have selected the Sherman s Pollen Extracts as being the most efficient.

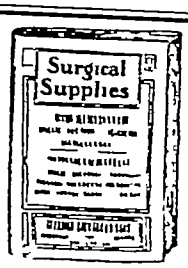
Safe and Efficient

Ragweed or Timothy

Sherman s Pollen Extracts are glycero saline solutions that do not require dilution. They are put up in fifteen sterile ampoules, each ampoule an average dose which is given at two to three day intervals for the prophylaxis of Hay Fever Treatment must begin with dose one and each subsequent dose must be given in numerical order This dosage meets the requirement of the average case and may be completed without unpleasant reaction to the patient.

Sherman s Timothy Pollen Extract and Ragweed Pollen Extract are marketed in packages of fifteen ampoules making a complete prophylactic treatment of 15 inoculations

As the pollen protein of the grasses is identical and the immunity a group reaction, immunization with Timothy extract can be used as a general immunizing agent against Spring and Summer Hay Fever caused by a large group of grasses. The same situation applies to a large extent, in regard to Fall Hay Fever which is caused by the Rag weeds For all practical purposes Timothy Pollen Extract will be found sufficient for Spring Hay Fever and Ragweed Pollen Extract for Fall Hay Fever



Complete Set of 15 Doses $10.00

SPECIAL NOTICE

DIAGNOSTIC TESTS for determining the susceptibility to Timothy and Ragweed Pollen furnished free of charge

matter of expense and time, to the great bulk of the medical profession of the state The ideal aimed at was to establish clinics sufficiently extensive and covering time enough, to give those in attendance a definite benefit, and yet not so extensive and not so expensive that the average practitioner could not afford them The medical colleges of the state—the University of Texas at Galveston, and Baylor University College of Medicine at Dallas, readily consented to undertake the task if the State Medical Association would undertake to popularize the clinics and make them worth while

"The bargain was quickly made, and the clinics were a success from the very beginning They have continued to grow in popularity, and so enthusiastic have many of those who attended them been, that on several occasions the proposal to extend the clinics and charge for them, has been made However, neither the faculty of the schools involved, nor the officers of the State Medical Association, feel that the time is yet right for expansion Therefore, there will be held clinics this year, as before, and they will be free, as before"

CANCER LECTURES IN MASSACHUSETTS

The *New England Journal of Medicine* for May 2 contains an editorial on "The Graduate Course in Cancer," from which the following abstract is taken —

"One of the most interesting and valuable public health activities of this section in recent times found expression last week in the Graduate Cancer Course conducted in Boston by the Massachusetts Medical Society with the assistance of the Massachusetts Department of Public Health and the American Society for the Control of Cancer It will be recalled that this organized campaign against cancer in this state was inaugurated by the Massachusetts Legislature, in other words the people of the state challenged the medical profession to engage in the study of a more efficient contest with this serious menace to the human race.

"In order to secure the greatest possible cooperation the Graduate Course in Cancer was planned and all who are interested were invited to enroll We venture to assert that no such intensive post-graduate study has ever been devoted to a specific disease in the history of this state and has only one other equally broad organized course of study been conducted in the United States This last refers to that in Pennsylvania a short time ago

"The registration of about five hundred doctors demonstrates the interest of the profession

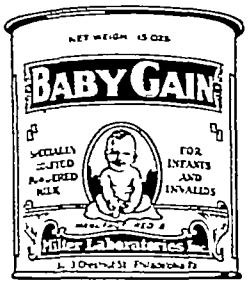
(*Continued on page 783—adv xix*)

sored in April Des Moines County on the 9th and Calhoun County on the 18th of April held open meetings to which were invited representatives of professional and lay health agencies to discuss methods of coordinating health work within the county

"The Des Moines County Society invited the County Dental Society, the Red Cross, the American Legion, the Parent-Teachers Association, County Federation of Women's Clubs, the Tuberculosis Association, the Social Service League and the Superintendent of Schools

"The Calhoun County Society invited representatives of the Farm Bureau, American Legion, Public Schools, Legion Auxiliary, Federated Women's Clubs Procedure with regard to a county school nurse and immunization was discussed and the lay members of the meeting voted thanks to the medical profession for its efforts for the public welfare"

LABORATORY SCHOOL



The Kentucky Laboratory School has demonstrated its value and usefulness to such a degree that physicians and hospitals may employ their graduates as technicians with confidence in their ability and enthusiasm The May issue of the *Kentucky Medical Journal* describes the school as follows

"On May 18th the School of Public Health of the State Board of Health will graduate seventy young men and women from their School for Laboratory Technicians More than one-half the class already have positions waiting for them, and every day brings requests from almost every section of the union for these graduates Among our pupils are many doctors' daughters, and other relatives, and they share with us the pride that we have in equipping these students to carry on the work of preventive medicine

"The remarkable development of medical science during the past thirty years to a large extent can be credited to the laboratory Prevention and control of disease are built around the laboratory The prompt and accurate diagnosis of communicable diseases depends upon the access of a good laboratory The pursuit of science is only a pleasure to those of specially trained mind To be of service to humanity it must receive wide dissemination, and every physician should have within easy access a well-trained laboratory technician so that he can give to his patients and to his community all the latest develop-

Committee on Publication

(*Continued from page 783—adv xix*)

"3 To act in the capacity of advisors on behalf of the medical profession upon legislative measures, hospitals, clinic, and so far as such activities pertain to the care of crippled children.

"The State Society for Crippled Children, represented by its secretary, Joe N Hamilton, met with the committee and made requests for assistance upon the following activities

"1 To endorse the clinics for the examination of crippled children as they have been conducted by this Society for the past three years

"2 To approve form letters and publicity which are sent out announcing each clinic

"3 To approve the method of advising and obtaining treatment for the cases which may be benefitted by hospitalization.

"The committee reviewed all such forms and methods as they are now being carried out and voted its approval The forms and methods referred to are as follows

"1 A form letter to doctors of the community announcing the clinic in a certain locality in which the name of the orthopedic surgeon is announced, and an invitation is given to the local doctors to attend and assist

"2 A form letter to the school teachers, ministers, civic clubs, lodges, in which the names of no doctors are mentioned but which describes the type of cases expected, where the clinic is to be held and the date of the clinic.

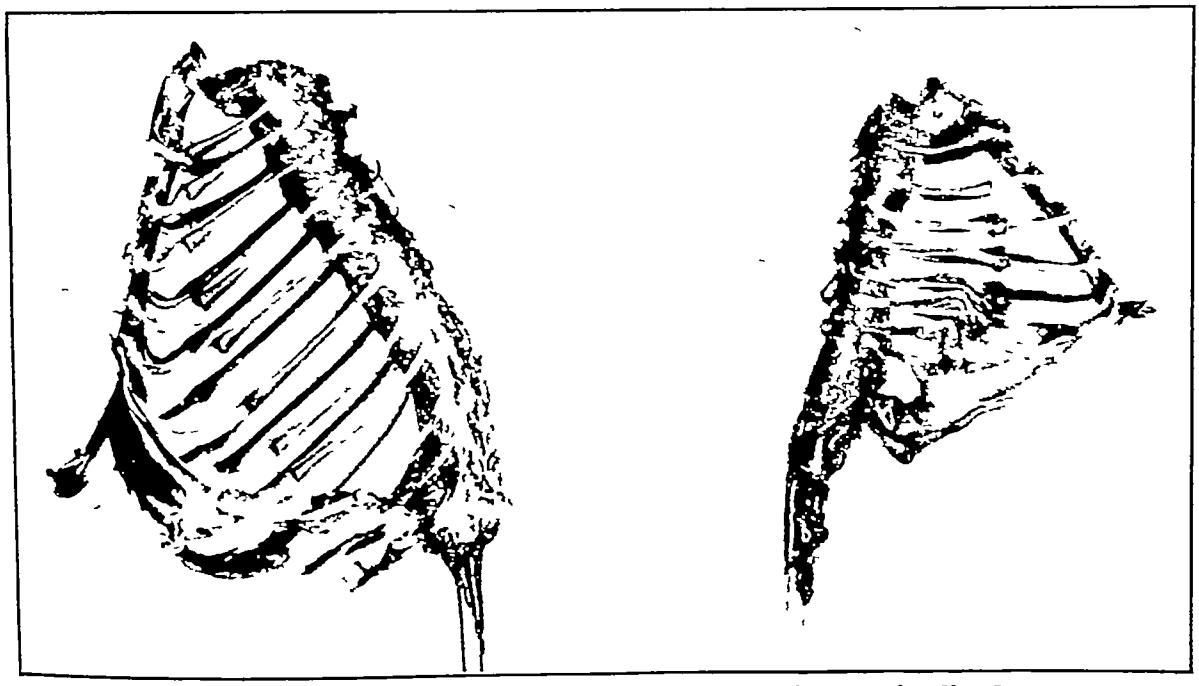
"3 A letter to the parent of the crippled child which has been examined, stating what the examining doctors recommend in the case and naming institutions to which the child might be taken for treatment

"The Committee passed favorably upon these measures

"Further request was made by the secretary of the Society that the Committee assist in the following

"1 Prepare and approve articles upon subjects relative to crippled children which might be used in educational matter to the public.

"2 That this committee assume the responsibility of informing the profession of the state as to the crippled children's law and methods of putting them into effect



"Earl D McBride"

JOINT MEETINGS

Joint meetings of County Medical Societies with other organizations are advocated in the following article in the May issue of the *Journal of the Iowa State Medical Society* —

"At least two county societies in Iowa took important steps toward coordination of county health activities at meetings which they spon-

VITA Glass Group
This rat was confined in a cage glazed with Vita glass permeable to ultra violet light.

Ordinary Window Glass Group
This rat occupied a cage glazed with ordinary window glass opaque to ultra violet light.

EXPERIMENTS PROVE ANTI-RACHITIC EFFICIENCY OF WINTER SUNLIGHT AND SKYSHINE TRANSMITTED THROUGH VITA GLASS

The two thoracic rat skeletons illustrated above are now on exhibition at the Medical Museum in Washington, D C.

Both rats were used in a test to determine the anti-rachitic efficiency of winter sunlight, conducted by Captain William D Fleming, of the Department of Preventive Medicine and Clinical Pathology, Army Medical School, Army Medical Center, Washington

Two groups of white rats were kept on a rickets-producing diet for 100 days A single difference distinguished the environments of the two groups—one group was confined in a cage glazed with ordinary window glass, opaque to ultra-violet light; while the cage of the other group was glazed with Vita glass, which admitted the ultra-violet rays

At the conclusion of the experiment, the rats under ordinary glass were characterized by extreme rickets The rats under Vita glass showed normal bone calcification, and an average weight gain of 103 grams, as against 56 grams for the rats in the other group

A subsequent test by Captain Fleming to measure the effect of northern *skyshine* (light from the northern hemisphere of the sky) in preventing rickets and promoting general nutrition, has produced equally interesting results

Detailed reports of both experiments have been reprinted from the Military Surgeon You are invited to mail the accompanying coupon for copies

Vita Glass Transmission Constant After Few Weeks' Exposure

Vita glass has been subjected to numerous accelerated weathering tests by the U S Bureau of Standards, by Professor Stockbarger of the Massachusetts Institute of Technology, and by many other physicists. These physical or quantitative tests, as well as biological experiments with rats and chickens, have established the fact that the solarization (weathering or seasoning) of Vita glass takes place quickly; and that after a few weeks of actual use its transmission of ultra-violet light becomes constant.

Vita glass is being marketed primarily as a health prophylaxis, and not as a therapeutic agent, although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 200 hospitals in England and the United States.

Few Doctors Prescribe Patent Nostrums

—yet many doctors prescribe exercise for their patients and let it go at that.

Be sure your instructions in this regard are carried out to the letter by sending them to McGovern's Gymnasium There the patient's work is planned in accordance with your own diagnosis A report of attendance and progress is sent you at regular periods, insuring that your exercise prescription is being competently filled

Let us send you a guest card so you can see for yourself our facilities for carrying out your orders

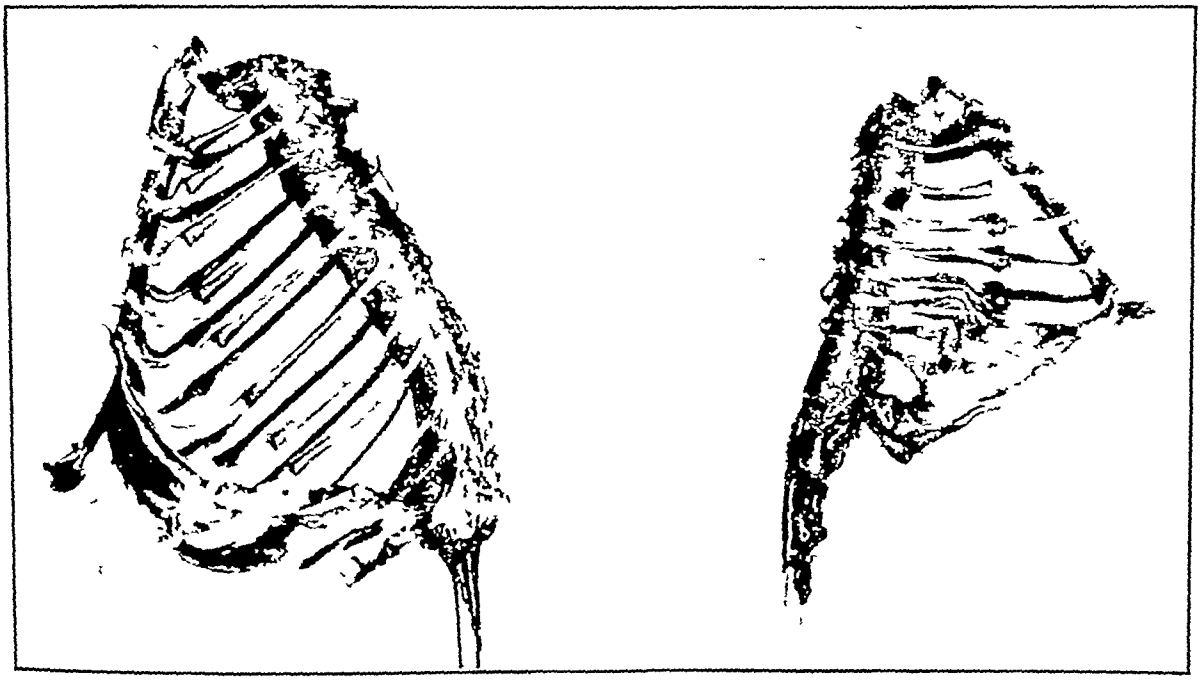
ments along the line of preventive medicine.



"We have endeavored through our School of Laboratory Technicians to make available to physicians, clinics, and hospitals, adequately trained technicians Every hospital, regardless of its financial condition, will be able to meet the requirements of the College of Surgeons by employing one of our qualified technicians If there is not sufficient laboratory work to keep them busy they can assist in taking histories, keeping hospital records, charting operative procedures, developing of *x*-ray films, and preparing and staining of tissues for the pathologist In doctor's offices they can assist in the preparation of patients in taking histories, and keeping records—in fact, act as a general office assistant

"The fame of this school has reached even our foreign countries We now have graduates from Shanghai, China, Cape Town, South Africa, and La Ceiba, Honduras, Central America The success of our school is due to the hearty co-operation of the physicians of Kentucky

"The following outline covers the course of instruction The procedure used in each subject has been compiled in book form and is available to any physician at cost This manual will assist the busy practitioner in interpreting laboratory results, and by using it as a reference he can assist his technician in all the new laboratory tests

Preparation of Culture Media
Stomach Analysis, Stomach Lavage
Blood Analysis which consists of Widal, Malaria, Blood Culture
Blood Counts
Blood Chemistry
Blood Grouping and Matching
Urine Analysis
Milk and Water Analysis, including Human milk
Tuberculosis, examination of sputum and urine
Diphtheria, including Schick Test and Virulence Test.
Intestinal Parasites, including Hookworm
Dick Test and Scarlet Fever
Throat and Nose for Hemolytic Streptococcus
Typing Pneumococcus
Renal Function Test
Van Den-Bergh Test
Icteric Index.
Typhoid group, Differentiation, Typhoid Carrier
Blood Culture for Typhoid Bacillus
Rabies, Examination of brain, and administering Pasteur Treatment
Meningococcus
Spinal fluid Analysis

VITA Glass Group
This rat was confined in a cage glazed with Vita glass permeable to ultra violet light.

Ordinary Window Glass Group
This rat occupied a cage glazed with ordinary window glass, opaque to ultra violet light.

EXPERIMENTS PROVE ANTI-RACHITIC EFFICIENCY OF WINTER SUNLIGHT AND SKYSHINE TRANSMITTED THROUGH VITA GLASS

The two thoracic rat skeletons illustrated above are now on exhibition at the Medical Museum in Washington, D C

Both rats were used in a test to determine the anti-rachitic efficiency of winter sunlight, conducted by Captain William D Fleming, of the Department of Preventive Medicine and Clinical Pathology, Army Medical School, Army Medical Center, Washington

Two groups of white rats were kept on a rickets-producing diet for 100 days A single difference distinguished the environments of the two groups—one group was confined in a cage glazed with ordinary window glass, opaque to ultra-violet light; while the cage of the other group was glazed with Vita glass, which admitted the ultra-violet rays

At the conclusion of the experiment, the rats under ordinary glass were characterized by extreme rickets The rats under Vita glass showed normal bone calcification, and an average weight gain of 103 grams, as against 56 grams for the rats in the other group

A subsequent test by Captain Fleming to measure the effect of northern *skyshine* (light from the northern hemisphere of the sky) in preventing rickets and promoting general nutrition, has produced equally interesting results

Detailed reports of both experiments have been reprinted from the Military Surgeon You are invited to mail the accompanying coupon for copies

Vita Glass Transmission Constant After Few Weeks' Exposure

Vita glass has been subjected to numerous accelerated weathering tests by the U S Bureau of Standards, by Professor Stockbarger of the Massachusetts Institute of Technology, and by many other physicists These physical or quantitative tests, as well as biological experiments with rats and chickens, have established the fact that the solarization (weathering or seasoning) of Vita glass takes place quickly; and that after a few weeks of actual use its transmission of ultra-violet light becomes constant.

Vita glass is being marketed primarily as a health prophylaxis, and not as a therapeutic agent, although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 200 hospitals in England and the United States.

DIPHTHERIA PREVENTION IN NEW YORK

How the anti-diphtheria campaign in New York City appears to the doctors of Massachusetts is told in the following editorial in the *New England Journal of Medicine* of April 25 —

"New York under its new Health Commissioner, Dr Shirley W Wynne, has embarked upon what is probably the most far-reaching diphtheria eradication campaign in history For the purposes of this campaign a diphtheria prevention commission has been formed under the chairmanship of Thomas W Lamont, and the press, the pulpit and the medical profession have been enlisted in its services Cooperating with the commission are the leaders of the county medical society, the Cardinal is lending his influence in this cause, and toxin-antitoxin stations are being opened in the parochial schools

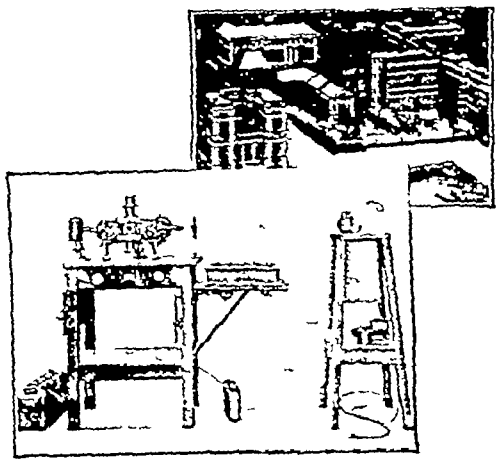
"This is not State Medicine, immunization by the private physician is being urged on the public, and the physician himself is urged to present the matter clearly to his patients The Health Department, in supplementing this activity, stands ready, of course, to immunize without charge those children whose parents cannot afford to pay for the services of the private physician From the first of January until the end of March it has been computed that 14,093 children had already been immunized by the special clinics, and 7,798 by private physicians

"All health advances, in the last analysis, depend upon the education of the people, and for this, to a great extent, the medical profession is responsible The millennium in preventive medicine cannot have arrived until the practicing physician realizes that he is an unofficial health officer, working hand in hand with the official health agencies The importance of this relationship is realized by the diphtheria prevention commission of New York, and upon the cooperation accorded it by the physician, much of the success of its campaign will depend

(*Continued on page 789—adv xxv*)

(Continued from page 788—adv xxiv)

"The layman himself is a factor of the utmost importance in determining the success of measures which are designed for his welfare Indifference on his part means failure, a despotic attitude, no matter how benevolent are its intentions, on the part of those who are attempting to safeguard him spells failure In successful public health activities there must be an interested triumvirate of official agencies, practicing physician and public, and their hands must be held up by the fourth estate This is the basis on which New York's diphtheria prevention campaign has started, and it should meet with the success which it deserves and which we unanimously hope for it"



OSTEOPATHY IN MICHIGAN

Of all the special schools of healing, that of osteopathy approaches most nearly to that of scientific medicine in its standards, which, however, are entirely too low The osteopathic legislation in Michigan is discussed editorially in the May Journal of the *Michigan State Medical Journal* as follows —

"At the time of writing, a bill granting osteopaths the right to practice medicine and surgery has been reported out of committee at Lansing and has passed the Senate by the required majority

"The sponsor of the osteopathic bill in a sort of casuistic argument sought to show that the training of the osteopath was superior to that of the graduate of such institutions as the medical department of the State University, the Detroit College of Medicine or Harvard or Yale, maintaining that the osteopathic school required more hours of college work than any one of these institutions If such were the case, there is no valid reason why the well trained osteopath should not be satisfied with medical standards as they already obtain in this state Why have a separate board if their requirements are higher than those of the regular profession?

"The time was in the memory of many in middle life, when there were several so-called schools of medicine All have become extinct but the regular profession which endeavors to conform to the findings of pure science where the sciences can contribute to the healing art There is no sectarianism in physiology, in chemistry, physiological chemistry Recognition of osteopathy as a system of medicine and surgery is a retrograde movement towards medical sectarianism"

In the past two years over 8000 tracings have been made with this No 2 Model "Hindle" Electrocardiograph

The "Hindle" Electrocardiograph

fulfills the exacting requirements of the Modern Hospital and Medical College Many of America's foremost Hospitals and Educational Institutions are using "Hindle" Electrocardiographs for their Research, Clinical and Teaching work

In the Bellevue and Allied Hospitals, New York City, EIGHT "Hindle" Electrocardiographs are in constant service. One No 3 Model, Mobile Type equipment has been averaging over 1,000 tracings monthly

4 Models Are Available

No 1 For those Institutions, doing extended research work.

No 2 For the large Hospital or Clinic.

No 3 STATIONARY TYPE, For clinical diagnosis in Hospital, Clinic, or private office.

MOBILE TYPE For hospital use, to be wheeled from room to room

PORTABLE MODEL May be taken to the patient's home

ENDORSEMENT OF SMOKING

The medical profession of the United States is a unit against any form of endorsement of smoking, and deplores the widespread advertisements that a considerable number of physicians may seem to endorse any brand of cigarettes The May issue of *Northwest Medicine* says

'Several months ago editorial reference was made to the gigantic advertising campaign conducted throughout the country through a great variety of agencies by the manufacturers of Lucky Strike cigarettes, who are spending millions of dollars for this purpose An advertising bait was cast to all medical journals in the form of a year's contract for a page of advertising Editors with a due sense for the proprieties, who recognized the vicious and demoralizing character of such advertising, declined to accept the contract It has been utilized, however, by some medical journals and many other publications, whose clienteles represent many classes of people

The utilization of the radio for this form of advertising has resulted in a wide-spread protest and a demand that the Federal Radio Commission revoke the licenses of thirty-eight leading stations of the National Broadcasting Company's Food Products Protective Committee These stations include one each in Portland, Seattle and Spokane It is claimed that the attempt to substitute cigarette smoking for wholesome products is a part of a campaign to transform 20,000,000 boys and girls into cigarette addicts It is charged that 'tainted testimonials' have been secured from professional athletes, football coaches, popular stage and screen heroes, suggesting cigarettes to boys and girls as an aid to athletic prowess, health and beauty Medical opinion of the country is also being continuously misrepresented Such testimonials are inherently misleading when they are not deliberately false, because the radio public is not told that the alleged recommendations for cigarette and other products are bought and paid for

"It is emphasized that the air is the domain of the people of the United States and stations are licensed to broadcast only upon the basis of public service As the broadcast voice invades every domicile, speaking alike to men, women and children, the home lies open and helpless to the intrusion of the spoken word broadcast from a radio station Support of this movement, it has been stated, has been secured from the American Medical Association, National Child Welfare Association, and many large church organizations, as well as educational and teachers' associations Representatives of many churches, child welfare associations, civic and social bodies have volunteered to appear before the Federal Radio Commission and go on record against this vicious propaganda which has stirred up such nation-wide opposition"

HEALTH AND NEWSPAPERS IN RHODE ISLAND

The May issue of *The Rhode Island Medical Journal* contains the following appreciation of the newspapers as heralds of health

"Medical truths reach the public by but few channels by the preaching of those qualified and by newspapers The principal informers of the public in matters medical are those newspapers who take it upon themselves to offer such vital and interesting information In no other paper that we read is there anything like the space given to medical and allied sciences, nor is the material so good by a large degree as that given by the *Providence Daily* and *Sunday Journal* Not only are the articles upon various ailments given in simple and direct wording, easily understandable by the average person, but the advice offered is consistent with the latest developments of medical science, without excursions into the visionary and the problematical These brief synopses and answers to questions are of inestimable value.

Why Physicians Recommend

SEDGWICK INVALID ELEVATORS

MANY of the Sedgwick Invalid Elevators now in daily operation were installed as the result of recommendations by physicians who know how climbing stairs strains weak hearts. Some physicians use them in their own homes These elevators are a blessing to invalids otherwise unable to move from floor to floor Easily and economically installed in old or new houses So simple a child can run them. No operating expense.

DIABETIC DIET READJUSTMENTS

Some foods cannot be allowed in diabetic diet at all and others only sparingly This means a readjustment in dietary habits that is difficult for the patient and trying for the physician Practically all of the restricted foods may be duplicated by using Lister's Flour Each of these starch and sugar-free foods looks and tastes like the food that it replaces in the diet With the variety of foods possible through the use of Lister's Flour, the patient is satisfied There is no temptation to "cheat" and the case is better kept under control Some of the Lister foods are See page i—*Adv*

LACTO-DEXTRIN

A prevalent cause of chronic constipation is the presence of colon poisons from intestinal putrefaction which tend to paralyze the bowel

Changing the intestinal flora, therefore, not only suppresses putrefaction by promoting the growth of benign, acid-forming organisms such as the B acidophilus, but tends to restore normal intestinal activities.

The experiments of Distaso, Torrey, Rettger and others have shown that lactose and dextrin are, by far the best foods for promoting the growth of these protective germs in the colon.

The good qualities of both lactose and dextrin, minus their objectionable features, have been combined in the palatable therapeutic food—Lacto Dextrin—See page vii—*Adv*

FORMALDEHYDE

A powerful non-corrosive sterilizing medium of high germicidal efficiency prepared especially for sterilizing Bard-Parker Knives and other fine surgical instruments

Destroys the most resisting spore-bearing bacteria in one and a half hours Does not injure the keen edge of Bard-Parker Blades or other fine steel instruments after two weeks' immersion

The Bard-Parker Sterilizing Container for hospital and office use is especially designed for the sterilization of Bard-Parker Knives Write for circular giving complete description of Bard-Parker Sterilizing Container and formaldehyde Germicide.—See page ix. —*Adv*

BACK TO WITHERING

What is the proper dosage of Digitalis according to the modern methods of treatment?

This question along with many other fine pointers on the modern method of treatment is answered in 'Back to Withering," written by a well known teacher, author, and physician, whose name is withheld for obvious ethical reasons

The Upsher Smith Company, 554 Sexton Bldg., Minneapolis, Minnesota, will gladly send a copy of the booklet and a package of their products to any physician writing in on his prescription blank or letterhead See page xi—*Adv*

VITA GLASS

Vita glass has been subjected to numerous accelerated weathering tests by the U S Bureau of Standards, by Professor Stockbarger of the Massachusetts Institute of Technology, and by many other physicists These physical or quantitative tests, as well as biological experiments with rats and chickens, have established the fact that the solarization (weathering or seasoning) of Vita glass takes place quickly, and that after a few weeks' of actual use its transmission of ultra-violet light becomes constant.

Vita glass is being marketed primarily as a health prophylaxis, and not as a therapeutic agent, although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 200 hospitals in England and the United States—See page xxiii—*Adv*

A FOOD DRINK

It is a well-known fact that the administration of suitable nourishment just before retiring is very effectual in inducing natural, restful sleep and this applies particularly in the treatment of insomnia and many extremely nervous conditions

A food-drink that is palatable, easily digested, rapidly assimilated and particularly appropriate for nourishment at the hour of retiring may be quickly prepared from the following formula

Mellin's Food	4 level tablespoons
Water	½ coffee cup
Milk	½ coffee cup

Place the directed quantity of Mellin's Food in the cup, then add the milk and water previously heated to the boiling point. Drink slowly while hot.—See page xxxi—*Adv*

POLAND WATER

Because of its purity and bland diuretic properties is always a desirable adjunct in the sick room.

Our records prove that Poland Water will often be taken freely when ordinary water is refused—See page xxvii —*Adv*

Dr. Barnes Sanitarium
STAMFORD, CONN

A Private Sanitarium for Mental and Nervous Diseases Also Cases of General Invalidism Cases of Alcoholism Accepted.

A modern institution of detached buildings situated in a beautiful park of fifty acres, commanding superb views of Long Island Sound and surrounding hill country Completely equipped for scientific treatment and special attention needed in each individual case. Fifty minutes from New York City Frequent train service.

For terms and booklet address

F H. BARNES, M.D., Med. Supt.
Telephone, 1867 Stamford, Conn.

HELEN J ROGERS, M.D
DR. ROGERS' HOSPITAL
Under State License
345 Edgecombe Ave. at 150th St., N Y C.

Mental and Neurological cases received on voluntary application and commitment. Treatment also given for Alcoholism and Drug Addiction. Conveniently located. Physicians may visit and cooperate in the care of their patients.

Telephone, EDGcombe 4801

BRIGHAM HALL HOSPITAL
Canandaigua, N. Y

A Private Hospital for Mental and Nervous Diseases

Licensed by the
New York State Hospital Commission

Founded in 1855

Beautifully located in the historic Lake Region of Central New York. Classification, special attention and individual care

Physician in charge,
Henry C. Burgess, M.D

ROSS SANITARIUM, Inc.
Brentwood, L. I., N Y.
Telephone, Brentwood 55

The Ross Sanitarium is for convalescent, the aged, chronic invalidism, and for those needing rest and relaxation. Resident medical and nursing staff. The Sanitarium is homelike, with close attention to diet and comfort of the patient. The number is limited, thereby making it possible for the medical and nursing staff to give individual attention. Physicians sending patients may direct their management and treatment. Rates $35 to $100 per week. Established 32 years.

MONILIA INFECTIONS OF THE HANDS AND FEET*

From the Vanderbilt Clinic, College of Physicians and Surgeons, Columbia University, New York

By J G HOPKINS, M D, AND RHODA W. BENHAM, NEW YORK, N Y

SINCE the first description of Kaufmann-Wolf[1] and Fabry[2], erosio interdigitalis has been made the subject of numerous reports These agree with great exactness as to the clinical appearance and general etiology of the disease and have marked out the condition as a sharply defined clinical entity In the lesions yeast-like organisms have been found with considerable regularity and their causal relationship definitely established by the inoculation experiments of Kaufmann-Wolf, Greenbaum and Klauder[3] and others The importance of a previous injury of maceration of the skin for successful inoculation has been also, demonstrated by Jessner and Kleiner[4] and by other investigators

In 1921, Kumer[5] described a type of chronic paronychia with secondary changes in the nails, also associated with the presence of yeast-like organisms He gave an accurate and detailed description of the lesions and defined the etiological conditions under which it might occur He described in detail the clinical features which differentiated this condition from trichophytosis, psoriasis, syphilis, eczema and from pyogenic paronychia His attempts at reproduction of the lesion by inoculation were unsuccessful and these were repeated by Shelmire[6] in a subsequent study of the disease, again without success Both of these investigators wrote with justifiable conservatism as to the causal relationship of the organism to the lesions

Kumer noted the occurrence of a typical interdigital erosion in one of his cases of paronychia The relationship between the two conditions was, however, not emphasized until the work of Kingery and Thienes[7] In an investigation of an epidemic among fruit canners, they noted both paronychia, interdigitalis erosions and dermatitis of the backs of the hands occurring in the same patients in an epidemic form. Similar yeast-like organisms were recovered from all three types of lesions and the dermatitis of the hand and interdigital erosions were reproduced by the experimental inoculation of the cultures The epidemic character of these infections strongly supported the hypothesis that the yeast-like organisms were the cause of all three Similar organisms have, also, been recovered from other types of skin eruptions, such as the generalized dermatitis occasionally associated with thrush in infants (Schamberg), with water-bed dermatitis of Kumer, and from various intertriginous lesions of the groins, toes, axillae and inframammary and intergluteal folds The numerous contributions to this subject have been well and completely reviewed by Shelmire and by Weidman[8]

Last year Cleveland White[9] reported before this section the recovery of similar organisms from cases of generalized, dry eczema and the reproduction of lesions in his patients by inoculations of cultures

Considerable doubt, however, has been thrown on the pathogenic importance of these yeast-like organisms by such observations as those of Frei[10] and Greenbaum and Klauder on the frequent occurrence of similar forms in normal skin. Nearly every student of these infections has found organisms of this type occurring in cultures which, also, showed a well recognized pathogen and in cases where other factors made it seem unlikely that the yeast-like organism was the cause of the lesions

However, the fact that these organisms are the cause of the interdigital erosions and the paronychia of the fingers is so well established that an attempt to show such a relationship in other clinical conditions seems worth while One factor in the difficulty in determining their pathogenicity is the uncertainty as to the species of the organism obtained from the known mycotic disease and the impossibility of identifying or differentiating strains obtained from other lesions It is with this phase of the problem that we have been chiefly concerned

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany, N Y, May 22, 1928.

Cases Studied

Since the discovery of known dermatophytes in eczematous and dysidrotic lesions of the hands and feet, the tendency has been to ascribe most such lesions to fungus infection, excluding, of course, those in which an adequate chemical irritation could be determined This has been in the face of the general experience that fungi can be recovered from only a small portion of the lesions We have hesitated to publish our own experiences as they have seemed to us an indication of our inadeptness in demonstration of the fungi At the risk of such an accusation, however, we will exhibit the following table of routine examinations by direct slide examination covering six or eight months

Table—I

ROUTINE DIRECT MICROSCOPIC EXAMINATIONS

	No Examined	*Fungus Found*
Dermatitis of the Hands (unknown cause)	197	10
Dermatitis of the Hands (occupational)	24	0
Dermatitis of the Feet	77	19
Intertrigo of the Toes	10	1
Onychia of the Fingers	34	12
Erosio Interdigitalis	13	9

Repeated and more thorough examination might well have yielded a higher percentage of positive of findings, but the results are sufficient to convince us that there are fungi in but a small proportion of the eczematous lesions in which their presence is suspected clinically It is quite probable that better clinical observation will enable us to differentiate the fungus infections from other types which we at present confuse with them

Erosio Interdigitalis and Chronic Paronychia

Positive findings were obtained far more regularly in interdigital erosions and chronic paronychias than in any other lesions Moniliae were recovered from ten patients who had an erosio associated with paronychia, from thirteen with erosio alone, and from nine with paronychia alone Of twenty erosion cases, it was detected in two by slide examination only, in three by culture with a negative slide, and by both slide and culture in fifteen The monilia was obtained by culture from eleven cases of paronychia and in eight of these it was recognized in slide also (Table IV)

Erosio interdigitalis presents an easily recognizable clinical picture, which often has been described It consists of a circular area on the webs of the fingers denuded of the surface horny layer The floor is covered with a white or a slightly reddened opaque layer of epidermis usually showing traces of ruptured vesicles This is surrounded by a collar of over-hanging epidermis and usually in turn by a zone of moderate erythema

The paronychias, also, presented a strikingly

FIGURE No 1

Erosio Interdigitalis, typical lesion between the fingers. Monilia in slide Monilia type No 1 in culture

uniform appearance Kumer's and Shelmire's descriptions of their cases apply almost as well to ours The most constant feature was the cushion-like swelling of the paronychium, most marked at the base of the nail and tapering off along the sides The surface epidermis over the swelling in acute stages was taut, glistening, in older lesions wrinkled and of a brownish or bluish-red color The nail plate was thickened, brownish in color and showed irregular transverse grooves, occasionally shingled Destruction of the nail plate was frequently visible along the sides beginning at the tip, but sometimes involving the entire free extremities Mycelium was demonstrated or cultured usually from the mass of dry white squames immediately beneath the eroded edge of the nail In four of the cases a thin pus could be expressed from beneath the eponychium The essential features are the chronic inflammation of the soft tissues about the nail combined with changes in the nail itself The former are never very acute, but during exacerbations there is usually a discharge of pus from the fold between the base of the nail and the over-hanging skin (This is essentially an intertrigenous location) The nail changes seem in part a malformation due to irritation of the matrix by this inflammatory process However, where the edges are eroded the parasite is found to have invaded the nail bed and apparently the nail plate also

Typical cases of moniliasis can usually be distinguished from onychias in which the trichophyton and achorion are found In the latter there is no paronychia or only a slight reddening of the paronychium which appears late in the disease. The destruction of the nail is more pronounced and begins usually along the free border with extensive separation of the nail plate from a hyperkeratotic bed Occasionally the breaking down begins over the lunula The practical absence of paronychia is, however, the striking difference in trichophytosis unguium The differentiation from chronic staphylococcic paronychia seems to us less certain Kumer was confident that it could be distinguished because a staphylococcic infection runs a more acute course and shows at one time or another localized abscesses either above or below the nail plate so that the swelling of the paronychium is uneven It is possible, that in some chronic cases which we have regarded as staphylococcic in origin, a monilia was present although undetected in our specimens

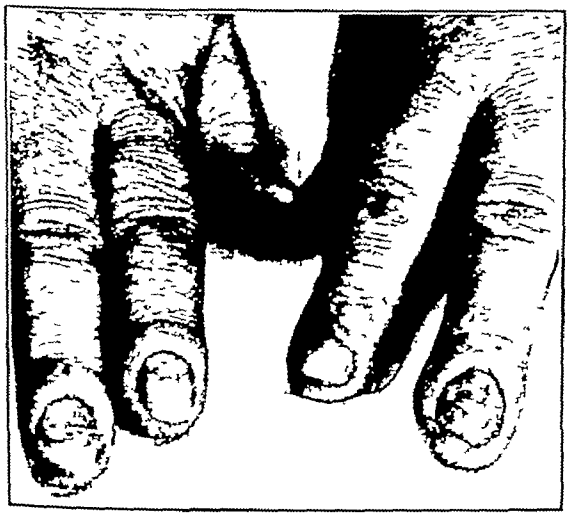

FIGURE No 2
Paronychia and onychia accompanied by bilateral erosion in third interdigital spaces Monilia found in slide and culture from erosion

The interdigital erosions occurred in the third interdigital cleft with the same frequency noted by other observers and in ten of our cases this was the only web involved The paronychia involved the thumb and index finger most frequently In about half of the cases this lesion was bilateral

One of two predisposing factors was invariably present—dishwater or the handling of fruit. The only male patient was a fruit dealer He had paronychia only One woman with erosio was a salad maker in a hotel Of the remainder all were women from twenty-four to sixty-five years of age and all but one housewives by occupation The majority were Russian Jewesses and, as White[1] has pointed out, their religious ban on soap in dishwashing may play a role Many substitute soda for soap which would account for irritation of the skin

Complications were infrequent and their relationship to the monilia infection was not determined Three patients had a dermatitis of the palms, one an interdigital dermatitis of the toes and one a dermatitis of the face. One had onychia of the toes, another diabetes with pruritus vulvae

Three other cases of onychia of the fingers from which yeast-like organisms were recovered on culture probably do not belong to this group One was a school girl of sixteen with thickening and erosion of the nails without paronychia. The slide showed fungus of the trichophyton type and on culture a monilia was obtained The other was a girl of twenty with favus of the scalp She, also, had a partial destruction of the nail plates and a fungus was found in the scrapings which

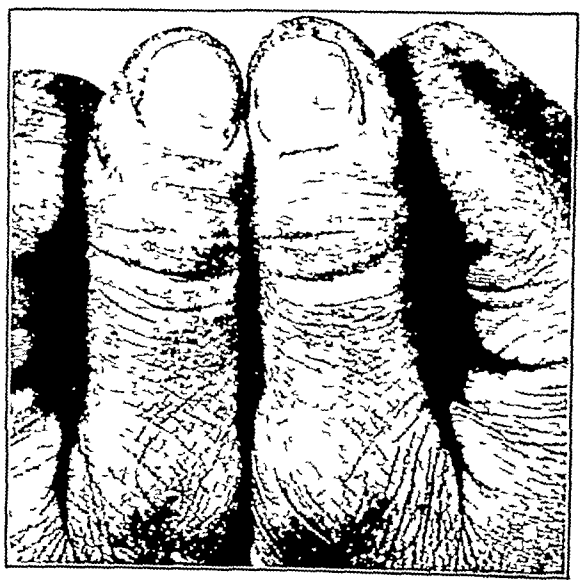

FIGURE No 3
Paronychia and onychia in male fruit dealer Monilia found in slide and culture.

was thought to be favus and was certainly not monilia On culture monilia only was obtained In this connection we might note that we have, also, recovered moniliae in association with the achorion in favus of the scalp In still another case of uniform thickening and desquamation of the nails in which the slide was negative a pink cryptococcus was recovered on culture This organism is probably a saprophyte and it seems unlikely it had causative relation to the disease.

Interdigital Dermatitis of the Toes

In lesions of the webs of the toes we have recovered moniliae on eight occasions, but in seven

of these direct slide preparations showed mycelium characteristic of fungi of the ringworm group Such mycelium can be differentiated with a fair degree of certainty from that produced by monilia In two of these cases the fungus was, also, recovered in culture and in one proved to be an epidermophyton interdigitalis and in the other, a trichophyton gypseum In only one instance could we find mycelium resembling that of a monilia in the slide preparation Here the culture was contaminated with bacteria, but the monilia, when isolated, was found to belong to group 2 described below, which is very closely related if not identical with the type usually occurring in erosio interdigitalis It is possible that in this instance the monilia was the cause of the lesions

Onychia of the Toes

In onychia of the toes we have recovered moniliae three times In two of the cases the direct slide examination showed a fungus of the ringworm type, in the third hyphae resembling those of monilia. The organism recovered, however, belonged to group 4 described below which seems rarely found in erosio or in paronychia of the fingers In this patient the finger nails were, also, involved, but the lesion was of the ringworm type without associated paronychia

Dermatitis of the Hands

In eczematous lesions of the hands we have recovered moniliae seven times on culture, but in none of these lesions was the organism recognized in slide preparation. Clinically the cases showed no uniformity in the location or character of the lesions Some were deep vesicular eruptions on the palms, others superficial erythemato-squamous lesions of the palm and of the dorsum One of the organisms isolated fell into group 4, one was a cryptococcus forming pink colonies, one was a monilia sitophila, a common bread mold, and the other two which were studied did not fall into any of the groups which we have been able to define

Dermatitis of the Feet

In dermatitis of the feet we have had a similar experience From six cases we have recovered the monilia in culture, but we have never detected it in direct preparation Four of the cases showed a fungus of the ringworm type in the slide preparation and in two of these trichophyton or epidermophyton were identified on culture These cases, also, showed no clinical uniformity The moniliae isolated were of varied types—one belonging to group 1 (the erosio type), one to group 4, the remaining four were not identified

Dermatitis of the Body

In five instances we have recovered moniliae from lesions on the body which showed little clinical uniformity Three of these were generalized eczemas showing a profuse growth of staphylococcus on culture. One of the organisms belonged to group 1 and two of them to group 4 Autoinoculation of one patient with the monilia culture was attempted, but was unsuccessful Of the other cases studied one was a typical tinea circinata with positive findings in the slide The other an apparent dermatitis venenata of the axillae The two latter strains of the monilia have not been studied

Mycology

A clearer understanding of the role which moniliae play in these infections seems dependent in part on a more definite characterization of the organism The description given of yeast-like forms recovered from erosio differ according to various authors and it is impossible to conclude at present whether one type, or any of the variety of types may be concerned in the production of the lesions Similarly when a monilia is recovered from some other lesion it is impossible to say whether it is the same as those found in erosio or a different organism

We have attempted a study of these morphologically and culturally, but more especially by agglutination methods, as these have proven of great value in the differentiation of bacteria which are morphologically and culturally indistinguishable We are far from complete studies on all of our strains, but the results so far obtained seemed of sufficient interest to report

We will first describe the findings in the two conditions where the etiological importance of monilia has been fairly definitely established—erosio interdigitalis and chronic paronychia of the fingers

The Parasite

The organism found in erosio digitalis appears in the squames in characteristic form In most instances there is a delicately branched mycelium about two microns in diameter It occurs usually in short fragments, but occasionally in thick mesh work It is more delicate and less refractile and as a rule narrower than that of the ringworm fungi, with a less distinct wall Septa are rarely demonstrable It is slowly acted upon by sodium hydroxide and occasionally disintegrates in the specimens that are left in this solution too long Oval spore-like bodies (from 2x4 to 4x6 microns) are, also, present, frequently with buds attached to their ends These lie scattered in groups through the epidermal cells or are attached to the hyphae from the sides of which they project at an acute angle Occasionally fifty or a hundred such spores are seen in huge balls connected by a hyphal thread which runs through their centers On account of their low refractility the organisms are somewhat less easy to see than are the trichophyta.

Cultures are fairly easy to obtain on Sabouraud's maltose medium and probably on other

acid media containing glucose They appear in two or three days as pasty, faintly yellow colonies which at first resemble a staphylococcus, but soon attain a larger size. On flasks where growth is not inhibited by surrounding colonies an individual colony may attain a diameter of 5 cm The edge becomes coarsely lobed in old colonies and the surface which is at first smooth with an ivory luster, developes numerous small folds and wrinkles over the central portion of the colonies

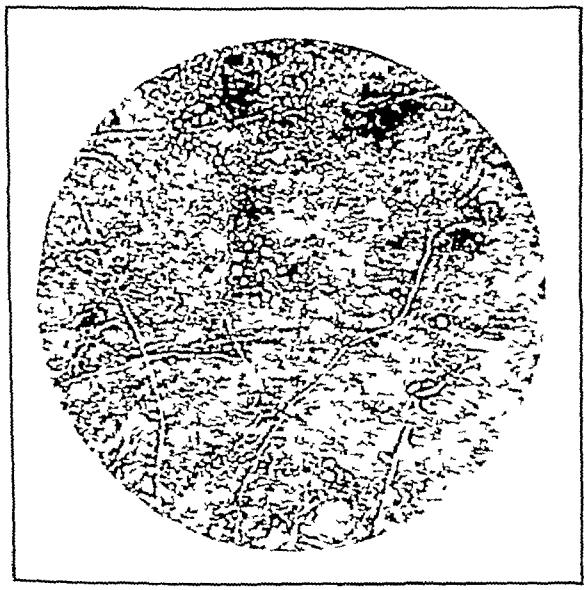

FIGURE NO 4

Direct slide preparation from interdigital erosion showing the delicate, slightly irregular mycelium with oval spores attached to the slide singly and in short, graduated chains, also, a cluster of round spores unattached

The entire surface never becomes wrinkled The colony never adheres strongly to the agar and its consistency is always pasty and easily emulsifiable in a liquid— points which distinguish this parasite from other closely related organisms

Microscopically the growth on solid media is made up chiefly of round or slightly oval cells, varying from 4 to 8 microns in diameter These multiply by budding One cell may show three or four buds and by successive budding chains of organisms of graduated size may be produced Two such chains developing from one cell produce a picture of branching Large round cells of twenty to thirty microns in diameter are, also, frequently found, possibly representing chlamydospores In older cultures more or less well developed hyphal tubes, are also found These may be seen as irregular tubules growing out from one of the round cells or as long branched threads forming an interlacing meshwork Oval or round cells are attached to the threads or lie in clusters in the meshwork The mycelial forms are regularly found in the growth at the bottom of the sugar broth tube and the development of the buds at their sides can be easily observed Huge spherical clusters of spores surrounding the hyphae at intervals may be seen along the lateral branches in gelatin stabs Sometimes a continuous sheath of many rows of spores is found along the hyphae. Anderson[12] observed similar structures in sub-surface growth of agar cultures of M psilosis Near their ends the hyphae are invariably septate and frequently constricted at the position of septa so that two elements may be joined almost in a point These threads are probably formed by elongation of the elements of a chain of rounded cells In the course of longer hyphae occasional transverse septa are, also, seen with no corresponding constriction of the filament

An important point in regard to the classification of these organisms is the formation of ascospores The presence of such spores has been reported in parasites from erosio lesions by Greenbaum and Klauder,[3] but as far as we can find no other investigator has been able to observe them We have yet found none in our cultures and can state definitely that they are not formed on Sabouraud slants This is a point, however, requiring further study by special methods as in most organisms of the yeast family ascospores develop only under very special conditions

The organisms which we have isolated grow in sugar broth with a sediment, only occasionally forming an oily scum at the end of fermentation or a pasty ring about the tube at the surface of the broth. This separates them from the genus mycoderma They grow in gelatin along the stab and most strains throw out numerous fine lateral branches which become gradually shorter towards the apex of the stab and give to the growth the "inverted pine-tree" appearance which Ashford[13] has described in M psilosis

Their fermentation reactions vary somewhat and our own results can be recorded only in a preliminary way Most of the strains ferment dextrose, levulose and maltose with the production of acid and gas, and galactose with the formation of acid and frequently of gas All fail to ferment lactose Some produce acid in saccharose, but none gas The fermentation of maltose is always more active than that of saccharose which distinguishes them from other strains which we will discuss later

Classification

These characteristics indicate a close relationship to the organisms occurring in thrush of the mouth and to the monilia psilosis isolated by Ashford from sprue. The absence of ascospores separated them from the endomyces and the presence of mycelium from the cryptococcus so that if we accept Castellani's classification they belong to the genus monilia. Their characteristic ivory color, smooth surface and pasty consistency distinguish them from many related organisms met with in skin lesions

TABLE II

12 Oidium alb	+	+	+	+	+	0	±	0	0
13 Endomyces alb	+	+	+	+	+	0	0	0	0

Agglutination Reaction

Classification by morphological studies or by fermentation reactions is difficult on account of their rudimentary morphology and the changes which this undergoes under varied cultural conditions Their fermentation reactions also seem somewhat inconstant and most investigators have distrusted classifications by this method A more definite classification of these organisms seems most necessary and we have attempted to obtain this by means of agglutination reactions At present we can make but a preliminary report on results obtained so far with nine agglutinating sera prepared in rabbits against the following strains of moniliae

1 A strain obtained from an erosio interdigitalis

2 A strain obtained from a moist intertrigo of the toes

3 A strain obtained from a typical paronychia of the fingers

4 A strain obtained from lingua nigra pilosa

5 A strain obtained from monilia psilosis (kindly sent us by Col Ashford)

6 A second strain obtained from moist intertrigo of the toes

7 A strain obtained from a generalized dry dermatitis of unknown etiology

8 A strain obtained from a typical erosio interdigitalis which differed in its fermentation reactions from any other strain obtained from this source.*

9 A pink cryptococcus found in association with an ivory monilia in paronychia of the fingers

Direct Agglutinations

On direct agglutination no definite differentiation should be made between the first seven strains Strains obtained from the American type culture collection labeled, Monilia albicans, oidium albicans and endomyces albicans also gave similar reactions This indicates the close relationship, if not identity, of three strains of organisms isolated from thrush which have been given different generic names also, the close relationship of the parasite we are studying to the thrush group

TABLE III

	Agglutinin Absorptions								
Groups	1		2	3		4		5	6
Ser. M.	1	2	3	4	5	6	7	8	9
Strains									
1 Erosio	+	+	+	0	o?	0	0	0	0

8. Erosio	0	0	0	0	0	0	0	+	0
9 Cryptococcus	0	0	0	0	+	0	0	0	+

Agglutinin Absorption Tests

We have found it difficult to obtain satisfactory checks in our absorption tests They appear however to show differences between cultures which agglutinate alike Strains 1 and 2 (group 1) appear identical, strains 4 and 5 (group 3) appear identical, strain 3 occupying an intermediate position shows affinities for both the first and third groups, strains 6 and 7 appear identical (group 4), and strains 8 and 9 (groups 5 and 6) seem distinct

Using this tentative grouping we have attempted to classify a number of strains obtained from erosio and paronychia and, also, other types of

*Further study of strain No. 8 has shown that when grown on beet it forms asci containing two spores with the typical derby hat form. This identifies it as a member of genus Willia. This is of interest because the differentiation which was made on the basis of fermentation and agglutination reactions was later confirmed by the discovery of definite difference in morphology

cutaneous lesions The results are shown in Table IV In the column headed *X* we have recorded strains which did not correspond to any of the six groups against which we had prepared agglutinating serum It will be seen that of the strains from interdigital erosions or paronychia which were tested, all but one fell in group 1 or in the closely related group 2 Members of group 1 were met with on one occasion each in interdigital dermatitis of the toes, in dermatitis of the feet and in generalized dermatitis of the body However most of the organisms of such sources fell into other groups One heterologous strain was obtained from an interdigital erosion In this connection we should bear in mind that obtaining an organism in culture from an exposed lesion is of relatively little significance We have several times obtained two distinct types of yeast-like organisms in the same culture Moreover the number of strains which we have studied is too small to warrant generalizations as to what occurs in this disease.

We may say, however, that twelve strains recovered from erosio interdigitalis and paronychia were indistinguishable morphologically, culturally or by fermentation reactions In these respects they correspond to the M psilosis of Ashford and to the strains isolated from thrush which we have studied They differ, however, in their failure to liquefy gelatin from certain strains reported from thrush, and in their fermentation reactions from some strains isolated by Castellani from this disease. The agglutinin absorption tests show a very close relationship between this monilia and the M psilosis While we cannot yet speak with certainty of a differentiation between the two, our work so far indicates such a difference exists This by no means warrants the setting up of such strains as a distinct species For the present we must regard the monilia found in this disease as a variety of M albicans closely related to M psilosis, but showing slight antigenic differences from these two organisms

Of the other moniliae studied, six fell into a well defined and sharply demarcated group (No 4) Morphologically, they are similar although we are not as yet sure that they are identical In gelatin they do not throw out the long lateral filaments characteristic of group 1 and of M psilosis, but form an even fuzz of short filaments indistinguishable from the appearance of M parapsilosis (Ashford) In fermentation tests they ferment saccharose more actively than they do maltose (which distinguishes them from organisms of groups 1 and 3) In the agglutinin absorption tests they fall together They were obtained from a variety of clinical lesions and in none of these have we definite evidence of their pathogenicity

Summary

1 The erosio interdigitalis of Kaufmann-Wolf and Fabry and the chronic paronychia of Kumer and Shelmire are frequently associated lesions with well defined clinical characteristics

2 These two lesions occur in the same two classes of patients, (a) Those whose hands are much exposed to dish water and (b) Those who handle fruit

3 The monilia isolated from these lesions has been shown capable of reproducing the erosio The regularity of its presence in the paronychia

*Culture was differentiated on morphological or cultural grounds
†This strain was found in a mixed culture with an ivory colored strain

and the frequent association of paronychia with erosio support the hypothesis that the two lesions are due to the same cause

4 The monilia isolated from twelve out of fourteen of our cases was found to be of a definite type This is indistinguishable culturally from the strains of M albicans and M psilosis which we have studied but frequently shows slight antigenic difference from the latter organism

5 Another distinct group of moniliae may be recognized in strains which we have recovered from other types of skin lesions

MATERNAL MORTALITY*

By MATTHIAS NICOLL, JR., M D
Commissioner of Health, State of New York, Albany N Y

IT is a duty prescribed by law upon health officials to take cognizance of all conditions affecting the health and lives of the population Among such conditions, and by no means the least important, are those having to do with pregnancy and childbirth which annually take a shocking and unnecessary toll of lives not only in this State but throughout the nation The facts regarding this matter have been concisely and graphically set forth in a recent pamphlet by Dr DePorte, Director of the Division of Vital Statistics of the State Department of Health, which unquestionably many of you have read and which, to those who have not, I recommend its careful consideration

The problem of excessive maternal deaths, notwithstanding the widespread interest that it has aroused during the last decade, the generous expenditure of public and private funds, and unceasing efforts on the part of official and non-official health agencies, remains unsolved Year after year the maternal death rate in this country and in this State shows little or no decline

The death rates from all puerperal causes in the thirty-three states of the registration area, ranged in 1924 (the last year for which these figures are available) from a minimum of 4 5 per 1000 living births in Utah to a maximum of 12 1 in Florida

In this group of states, New York held a favorable position with a rate of 5 9, in only five states (Connecticut, Indiana, Minnesota, North Dakota and Utah) was the rate lower, and in one state (California) the rate was equal to that of New York while the remaining twenty-six states had higher rates

Deaths from all puerperal causes in 1915-1925 in New York State numbered 15,876 Relating these deaths to the total number of recorded live and stillbirths (2,713,207) we find the death rate for that period 58 5 per 10,000 total births, in other words, one out of 171 births resulted in the death of the mother

The average annual death rate in 1915-1920, exclusive of 1918 (the year of the great influenza epidemic when mortality from puerperal causes was abnormally high), was 56 8 per 10,000 total births, the average annual rate in 1921-1925 was exactly the same—56 8 Thus the situation in the State during the two successive five-year intervals did not change at all

An analysis of the figures for the eleven-year period considered in this paper discloses the striking fact that the rate of maternal mortality in the urban part of the State, exclusive of New York City, (urban districts being defined as villages and cities having a population of 2,500 or more) has apparently increased while a definite reduction has been recorded in the rural territory Thus, in 1921-1925 in the urban part of the State, mortality from puerperal septicemia was 1 3 per cent higher than for the preceding five years (exclusive of 1918) and from other puerperal causes 8 6 higher, whereas in rural New York the mortality from puerperal septicemia declined 23 9, and mortality from all other puerperal causes 27 3 In 1927 the total maternal mortality rate in the urban section was almost double that of rural New York If one takes these figures at their face value, it might logically be deduced that the risks incurred in childbirth were far greater in urban than in the rural districts This conclusion, however, is not clearly warranted for the reason

*Read before the Annual Conference of Health Officers and Public Health Nurses, Saratoga Springs, N Y June 1928

that during the period for which these figures were compiled there was an ever-increasing tendency for rural mothers to enter hospitals or larger centers of population for their confinement, and there can be no question that complicated cases from rural districts are those for whose outcome the urban districts are made statistically responsible

A very extensive and detailed study of the history of individual cases in which death occurred would have to be made before reaching a definite conclusion as to the comparative safety of child-bearing in the two areas

I desire to call your attention to two rural counties—Lewis and Hamilton—in which no maternity deaths occurred during 1927, in the former there were 424 births, 13 stillbirths and in the latter 50 births and 2 stillbirths

As throwing a valuable sidelight on obstetrical practice in upstate New York, may I call your attention to certain facts obtained as a result of a questionnaire sent to physicians in whose practice one or more maternal deaths had occurred, and I desire to express my appreciation of the wholehearted cooperation of the physicians to whom the questionnaire was sent—80 per cent of whom have responded and reported the facts in 2,392 cases covering the 3½ year period ending July, 1927 I regret to state that the hospitals have not been far less cooperative A study of these confidential reports will require a great deal more time than has been possible up to date, but the following facts based on the preliminary perusal of the findings for 1925, involving 696 cases, seem to me important

Of the 696 cases, hospital care had been involved in 74 per cent , about half of which were delivered, and died in the hospital and the rest delivered in the home but dying in the hospital later

Only a third of these cases reached full term, a fifth of them were under five months gestation

The lapse of time between the delivery of the case and the death of the mother falls in the following divisions In a fifth of the cases death and delivery were practically simultaneous, in a fourth of the cases there was a lapse of from one to five days between delivery and death, in a fifth of them 6 to 14 days, and in an eighth 16 to 50 days

Seasonal variations 30 per cent of the cases occurred in the first quarter, 25 in the second, 23 in the third, 22 in the fourth quarter of the year February showed the greatest number of deaths

Ninety-two per cent of the deaths were in the age group from 20 to 40 years As to nationality 75 per cent. were American born, 9 per cent Italian, 4 per cent Poles Postmortems were performed in only 8 per cent of the 696 cases Over 5 per cent were illegitimates, 22 5 were primipara, 12 per cent second pregnancy

There were 230 questionnaires which stated at what stage the patient had entered the hospital Only 13 per cent entered before the beginning of labor, 37 per cent entered during labor, 50 per cent. were brought in after delivery

As to the number of days in the hospitals, there were 223 replies which showed that 40 per cent were in the hospital less than a day, 53 per cent up to 2 weeks, and 7 per cent more than 2 weeks This high percentage of cases that had hospital care for less than a day would indicate a high rate of emergencies

Consultation was advised in 56 per cent of the cases and was held in 55 per cent

How much opportunity did the physician have to give thorough medical care? To this question there were 483 replies Fifty per cent had the case a week or less, over 10 per cent had the case less than a day, the balance were under medical care for varying periods but only 13 were reported as having been cared for throughout pregnancy

Fifty-eight per cent had but one doctor, 8 per cent. had a different doctor during the fatal outcome Only 1 patient was reported as having had no attending physician, but 5 others had no physician at the time of death

During the final illness 44 per cent had 1 doctor, 26 per cent had 2 doctors attending, and 3 per cent had 3 or more physicians in attendance

Only 16 cases were reported as having been delivered by a midwife, but 11 others had a midwife in attendance at some time A midwife was involved in one death but was later exonerated

As to prenatal care, 41 per cent. failed to answer Of the 408 answers 65 per cent reported yes, 35 per cent reported no From the meager information as to the details of prenatal care in the questionnaire it would seem that it is most difficult to gauge its effectiveness If it is measured by the minimum standards as issued by the State Department of Health some five years ago, it would appear that few cases had had the benefit of what might be termed adequate prenatal care In attempting to ascertain when such care began it is found that 34 per cent did not have prenatal supervision until the 7th, 8th or 9th month

Among these cases puerperal sepsis accounted for 37 per cent. of deaths, albuminuria and the toxemias 21 per cent , hemorrhage 9 per cent These figures are based upon the cause of death, as shown by the death certificates It is, however, interesting to see wherein the puerperal questionnaire has enriched our information, particularly with respect to operative procedures According to the information obtained from the death certificates, only 5 per cent of the cases were indicated as operative, whereas in the puerperal questionnaire 38 per cent of the deaths

were involved with operative procedures, there being 69 Cesarean sections, 19 embryectomies, 105 forceps, 65 versions Again, according to the death certificates hemorrhage is given as a cause of death in but 9 per cent of the cases, whereas in the puerperal questionnaire, we find that hemorrhage is involved in 17½ per cent of the deaths, 67 being prenatal and 58 postnatal hemorrhages

From these figures two facts stand out clearly First, the large proportion of maternal deaths caused by septic poisoning, and second, the large number of cases in which operative procedures, —instrumental or otherwise—were employed It is largely agreed by those who are qualified to express an opinion, that one of the chief causes of excessive maternal deaths is the increasing tendency to interfere with physiological processes This tendency would seem to be especially prevalent among city practitioners and in hospital practice I do not wish to be understood as inferring that many cases do not require such interference, but I am thoroughly convinced that many more in which it has been employed, if left to themselves, would have gone through their ordeal with safety Again, there can be no question that there is an increasing tendency to make unnecessary internal examinations, and this would seem to be especially true in hospital and city practice—the rural practitioner under ordinary circumstances being satisfied to let nature take its course Under our system of hospital management I think it will be conceded that there is very little central medical supervision over the methods of practice of individual physicians, and this is certainly true in the case of obstetrics Furthermore, it has been brought to our attention that clinical records in a number of institutions are not available, so that it is impossible even to venture a guess as to the actual cause of the fatal outcome of a maternity case More than any other health problem, that which has to do with maternal mortality involves the private practice of the medical profession It is quite evident that the State Department of Health, or any other official body, cannot practice obstetrics, —it can only advise as to the facts, study conditions under which obstetrical care is given insofar as it has the power to do so, cooperate in a campaign of public health education for prospective mothers with the medical profession and other agencies, and place at the disposal of communities such facilities in personnel and equipment as will lead to better and safer obstetrical practice The responsibility for the condition of affairs which I have briefly outlined rests with the practicing physician, and whatever remedial measures may be forthcoming must, in large part, emanate directly from the state and constituent county medical societies One of the first duties, it would seem to me, is for the State Medical Society through whatever machinery may be necessary to make a study of the methods of obstetrical practice among the various hospitals I do not know whether there are legal objections to such a procedure It is difficult to see why there should be If such a work is undertaken, I believe that it would be possible for the State Department of Health to help out financially, as well as by supplying personnel and statistical data

That this problem is not insoluble is shown by maternal death rates among a few foreign countries which are one-third to one-half of that recorded in the United States Even if it be conceded that the task is a more difficult one in this country with its immense area involving widely scattered communities—many of them accessible only under great difficulties—a population markedly divergent in racial peculiarities and habits of life, nevertheless with the immense resources in money and personnel at our disposal, it should be possible in the not distant future to remove from this country the stigma of inefficiency and seeming complacency which results in an unnecessary number of deaths in childbirth To that end I invite the heartiest cooperation of the health officers, physicians and nurses of this State with the State Department of Health

---

PROLAPSUS—ITS ANATOMICAL REPAIR*

By REGINALD M RAWLS, M D, NEW YORK, N Y

IN a review of the literature of Prolapsus Uteri one is confronted by a voluminous literature concerning its etiology and treatment and one finds recorded innumerable operative procedures for its relief This is due in no small part, to our textbooks of anatomy which give full descriptions of the tissues of the male pelvis with descriptive drawings but give scant attention to the female pelvic structures which are described, in parentheses, when they differ from those in the male and for the most part there are no descriptive drawings Also in many text-books of gynecology there are diagrammatic drawings which show only the fascia of the fibro-muscular pelvic diaphragm and describe this layer as the vesico-rectal layer which should apply only to the male pelvis Others neglect all together the divisions of the fascia and fail to show the intercullar connective tissue or visceral layer of the fascia in its relation to the bladder, the urethra, uterus, rec-

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y May 23 1928

tum and vagina Much of our haziness of the anatomy and importance of the pelvic fasciæ in the female will clear away if we give due attention to the description by such anatomists as Piersol and Cunningham and to the special anatomical research work of Halban and Tandler, Edward Martin, Robert Frank and the more recent monograph of Joseph Halban

Cunningham (1) says, "the floor of the pelvic cavity of the female is formed, as in the male, by the levatores ani and the coccygei muscles, and the upper and lower fascial layers of the urogenital diaphragm, but it is pierced by three canals instead of two, viz, the urethra and anal passage, as in the male, and, between them, the vagina In this way the floor of the pelvis, in the female, is rendered relatively weak and less capable of resisting strain, whilst at the same time it is adapted to the function of child-bearing, for it is cleft by the vaginal canal into two segments—an anterior, including the anterior vaginal wall and all the parts in front of it, and the posterior vaginal wall and the parts behind it. The former can be lifted into the pelvis and the later can be forced downwards, much as the two segments of a folding door are displaced in opposite directions, and thus a passage is made for the exit of the child (Berry Hart)" Cunningham also notes, "as a matter of clinical importance, that, whilst the urethra and the anterior wall of the vagina are closely bound together and cannot be separated except by the use of the knife, the posterior wall of the vagina and the anterior wall of the rectum are only loosely united together, and can easily be torn apart."

To the above description, I feel we can all agree but when the structures of the anterior and posterior segments are analyzed and their relation to the pelvic contents and their function described I feel there is room for debate. However, whatever our definition of the etiology of Prolapsus Uteri may be it cannot be any more concise or undebatable that the view expressed centuries ago by Soranus (2) He gave us an abstract of his view, as well as the views of those who preceded him, of the etiology of prolapse It was due the ancients believed, to the stretching, rupture, or relaxation of the muscles and membranes that normally keep the womb in place

The most debated and debatable subject of the anatomy of the female pelvis is its system of faciæ.

According to Piersol confusion has existed in the application of the term "white line" since it has been made to include both the arceus tendinous proper and the thickened band from which the levator ani takes its origin (arceus tendineus m levatoris ani) These bands are, however, quite distinct, especially anteriorly, as careful inspection of the subject will demonstrate, and it seems preferable to restrict the term "white line" to that from which the levator ani arises, naming that at which the fascia endopelvina begins the arcus tendineus Further describing the arcus tendineus, he says it is attached behind to the spine of the ischium and passes in front upon the sides of the bladder, and is continued thence to the anterior pelvic wall, to be attached on either side of the symphysis pubis, a little above its lower border, as a lateral pubovesical ligament

Cunningham, although he makes no distinction between the arcus tendineus and the "white line," gives a more detailed description of the secondary lamellæ associated with the pelvic viscera. He says that at the "white line" the pelvic fascia is separable into two parts a parietal portion, which forms one of the strata of the walls of the pelvis, and a visceral portion, the upper fascia of the pelvic diaphragm, which forms part of the pelvic floor and lies upon the muscular diaphragm which separates the pelvis proper from the perineum Further, he says if the visceral layer is traced medially it splits into secondary lamellæ the vesical passing on to the bladder and in front of the urethra and vagina, the rectal which passes behind the rectum, and the rectovaginal which passes between the rectum and the vagina In describing the true ligaments of the bladder, Cunningham says the lateral pubovesical are merely the lateral parts of the vesical lamella, while the anterior or median pubovesical are thickenings of the anterior lamella, one on each side of the median plane

Robert Frank (4), in a report of his anatomical research and an analysis of the work of others, says "According to Halban and Tandler (5) all evidence is construed to signify that the muscles play the main or only role in maintaining the bladder, uterus and rectum in position, according to Edward Martin (6) the fasciæ are mainly responsible" Frank states—"To unbiased observers both systems play important and co-ordinate roles," and all fascial structures encountered within the pelvis should be considered as connective tissue. Also the sub-peritoneal space (i e the space between the peritoneum and the levator fascia) is partly filled by the urethra and base of the bladder, the vagina, and the uterocervical area, and the rectum Blood vessels, nerves, lymphatics, and the ureters also traverse this space. All interstices are filled in by connective tissue of different consistence, varying from loose, fatty, arealor tissue to well-defined fibromuscular and elastic bands This tissue fixes the organs but yet allows them freedom necessary to permit of varying degrees of distention Frank also recognizes the main divisions of this tissue as pubo-cervical ligaments, cardinal ligaments, and sacro-uterine ligaments According to Frank these tissues or ligaments are the upper or holding apparatus

According to Edward Martin one has to distinguish fascia, connective tissue, coats of muscles

and condensed connective tissue resembling fascia The latter has no connection with the musculature and it is a tissue peculiar to the female pelvis He follows Waldeyer, who recognizes a parietal and visceral layer of pelvic fascia whose line of junction is the arcus tendineus of the pelvic fascia The visceral further divides into the vesical, vaginal and rectal layers, which are recognized as differentiates of the subperitoneal pelvic tissues Martin demonstrates by his dissections that the thickened portions of the connective tissue of the pelvis is an irregular mesh-work which he names retinaculum. The strands of this mesh-work unite from all sides forming an almost uniform plate around the uterus The tissues composing this mesh-work are named from the direction in which they radiate from the condensed portion around the uterus Pars media are those which run in a lateral direction, pars posterior those which run around the rectum and pars anterior the thinner tissues which run to the lateral walls of the bladder

Joseph Halban (7) in 1919 in a monograph on the anatomy and etiology and operative treatment of genital prolapse has added to the literature a valuable and, to my mind, an outstanding contribution In the female pelvis Halban recognizes two systems of fascial structures the fascia endopelvina which is continuous with the fascia endoabdominalis and the individual muscle fascia or "eigenfascia" The fascia endopelvina is immediately under the peritoneum and lines the whole lesser pelvis following the contours of the obturator internus and levator ani muscles down to the hiatus genitalis Where it comes in contact with the individual muscle fasciæ it is connected with them by arealor like connective tissue. At about the level of the arcus tendineus it divides into vesical, vesico-vaginal and rectal layers The endopelvic fascia is extremely thin and wide meshed, but it becomes thickened where great strain is put upon it especially in the pelvic portion where it is thick sheathed This is especially true in the base of the broad ligaments, the region of the cervix, the utero-sacral ligaments and the supports of the bladder The chief function of the endopelvic fascia is to indirectly fix and suspend the pelvic organs

According to Halban the musculo-fascial diaphragm is the more important system for even when the endopelvic "hammock" is injured we do not necessarily have a cystocele, rectocele or prolapsus uteri if the musculo-fascial diaphragm is well developed and functioning properly In other words both the fixing and supporting structures are important but the supporting structures are more important [I feel that the Halban premise is faulty for I believe all of us have seen cases in which there was complete laceration of the musculo-fascial diaphragm, certainly for its anterior half and yet there was not prolapsus or cystocele] He also believes that with an injured or congenitally weak holding or supporting structures a retroverted uterus by the aid of intra-abdominal pressure causes the prolapse. Further Halban has found that even after an inter-position operation the cervix may become elongated and forced out of the vulva by the action of intra-abdominal pressure Therefore, he always amputates the cervix—taking off about 2 cc when the uterine cavity measures 8 cc or more From Halban's monograph it seems we are now at the point where we can discard many different names and complicated anatomical descriptions and say that prolapse is due to the injury or weakness of the fixing and suspending endopelvic fasciæ and to the individual fasciæ (Eigenfascia) and muscles Thus we have two independent fascial structures with similar distribution in the pelvis rather than many divisions of one fascia.

While we may not all agree with Halban that the musculo-fascial structures are the more important, yet I feel most of us will agree that his anatomical description is the most convincing to date. For my own part I feel that Chipman has best described the etiology of prolapse as follows "Prolapsus uteri is simply a hernia, a hernia through the fibrous diaphragm of the true pelvic floor—a sacropubic hernia In common with all herniæ the protrusion has a canal of descent—namely the vagina, a sac and sac covering or wall As regards the uterus its essential support is the fibrofascial sling of the pelvic floor Its accessory supports are, above, its peritoneal folds and below the muscular layer of the pelvic outlet The uterus may be considered a sitting in a swing, the seat of the swing at the isthmus The body above, clothed in peritoneum, is steadied in this seat by the peritoneal folds or guy ropes The cervix, however, projects below the level of this seat and hangs within the vaginal vault. Still below this cervix, and closing the pelvic outlet is the muscular layer of the pelvic floor This affords some additional support, a foot rest, as it were, to the uterine cervix The analogy is that of a person steated in a swing steadied therein above and with a definite foot-rest below"

History of Operations for Cystocele & Prolapsus Uteri

In the first fifty years of modern gynecology, the operative treatment of prolapsus uteri and cystocele was by denudation and suture, of the anterior vaginal wall, of the vulva, of the posterior wall and excision of the cervix or a combination of these methods As early as 1869 Emmet (9) recognized the importance of the fascia of the anterior wall of the vagina and devised his operation for procidentia which consisted in a denudation of two points, one about half an inch from the cervix on either side and a little behind the line of its anterior lip, likewise a surface was denuded in front of the uterus an inch long and half an inch wide. The freshened areas

were brought together in front of the uterus by silver sutures and the folds in midline were freshened on either side and approximated with silver wire According to Emmet this method gives a direct lateral support from the pelvis, giving in many cases, by this means alone, a sufficient support entirely independent of the column to be afterwards formed from the tissues turned in along the anterior wall In 1912, the late L Grant Baldwin (9) published excellent results from an operation based on Emmet's technic Five years after Emmet recognized the anatomical importance of the fascia of the anterior vaginal wall, Simon and Hegar (9) simultaneously devised, for prolapsus uteri and cystocele, an operation on the posterior vaginal wall They reasoned that a firm cicatrix in the midline of the posterior wall would elevate and support the uterus as well as the anterior wall and bladder

The next step in anatomical repair was in 1887 when Hadra (9) first performed "flap-splitting" of the anterior vaginal wall and used elevation of the bladder for cystocele One year later Sanger (9) suggested an operation similar to Hadra's method and later published the results of an extended experience with what he calls "flap-splitting" The next advance in anatomical repair of the anterior wall was made by Gersuny (9) who, after flap-splitting, elevated the prolapsed bladder by a purse-string suture introduced into the fascial coverings of the anterior wall Joseph Halban gives Gersuny the credit of first recognizing the importance of the fasciæ of the anterior vaginal wall and has adopted his purse-string suture for operations on the repair of the anterior wall

Within the last half century operations on the structures of the anterior vaginal wall as a part of the technic for prolapsus uteri has become more and more accepted by the gynecologist As early as 1889 Hadra said in regard to descent of the anterior fornix or, if more of the wall be detached, to cystocele, "surgical interference has not been based on sound fundamental principles" Exsection of the vaginal wall is practiced for revulsive effect or for increasing the distance from the cervix to the vulva or for pouching But the reattachment, the restoration of normal relations between vagina, bladder and cervix, is what we ought to look for"

The stages of evolution of the operations for prolapsus uteri have been quite gradual from the recognition of the importance of the fascia, then flap-splitting, elevation of the bladder and then the following procedures Vaginal Fixation of Mackenrodt and Duhrssen, Interposition Operation of Watkins, Stone, Wertheim and Schauta, Vagino-abdominal route of Stone, Emil Ries (13) and Farrar (12), Suspension of bladder from uterus and broad ligaments or from the sutured stumps of the broad ligaments by Goffe, reefing the cardinal ligaments by Alexandroff, Tweedy and Dudley, and reefing of the utero-sacral ligaments by Jellett, Bove and Young among others, the interposition of the sutured broad ligament stumps after hysterectomy by Mayo and the modification of the Mayo by fixation of the stumps of broad ligaments to the periosteum of pubic bone by Ward and Masson (10-11)

In the last twenty years the outstanding operations for cystocele and their relation to operations for prolapsus uteri have been reported by Martin, Frank, Neel (15), Bissell (14), Halban, Ward, Watkins and the author

Martin's technic for cystocele, published 1911-1912, consists of a dissection of the anterior vaginal wall with a suturing together of the lateral bundles of fascia (anterior crura of the retinaculum) thus reforming the fascial support for the base of the bladder He states that Kreutzmann, Sipple, and Violet have described a similar operation but with not so extensive a dissection He credits Violet with demonstrating correctly the tissues pertaining to cystocele operations and to Amann he gives credit for the technic of dissection

Halban feels that the technic of Both Violet and Martin is faulty and says of the latter that instead of suturing the ligament vesico-vaginalis lateralis or the crura of the retinaculum he only closes the defect in the fascia made by its dissection

In 1901 Stone and 1913 Lockyear published methods similar to Violet but the latter approximated the fascia under the bladder by mattress sutures thus making a buttress in the midline of the anterior wall

In 1917 Frank published the result of his anatomical research and a method for the relief of cystocele He makes note that "in looking up the literature he finds that Martin has described a similar operation which had been used in Bumm's clinic The sutures unite the 'pillars' but do not include the cervical tissue in their grasp" Frank makes a vertical incision "just penetrating through the vaginal mucosa" Then—"starting from below upward, the vaginal mucosa is separated from underlying bladder for a distance of only 1/4 cm along the entire edge on both sides of the incision, the vaginal flap is made as thin as possible At the bottom of incision a few snips of scissors cut across the so-called vesical ligament The gauze covered finger by stripping upward and backward, strictly in median line, now frees the lower margin of the bladder from the cervix—as this is done, on each side fascial fibers, running upward and backward become apparent These are the bladder pillars (pubo-cervical ligaments) which are invaluable in the repair Not until this dissection is done is it wise to separate the vaginal mucosa to the necessary distance laterally"

In 1919 Ward published his method of Cystopexy, which he had been using successfully for

eleven years He describes his technic as a "combination of the methods of Hadra, Goffe, Martin and Frank, Alexandroff and Sims, with the result of reducing the hernia, replacement of its supports by overcorrection, which is the principle usually employed in hernia operations, overcoming the excess of bladder base and vaginal wall both anteroposteriorly as well as transversely, with a restoration of the anterior invagination of the cervix, and the elevation and anteversion of the uterus" Ward has also called attention to enterocele and has devised a method for its relief

Also in 1919 Walkins (16) published an operation for the anterior vaginal wall in which he says cystocele is hernia resulting from a transverse tear in the vesicovaginal fascia—almost universally near the site of the cervix. Closure of this ring and restoration of the fascia to its normal location will cure the urethocele and plastic repair of broad ligaments ensures firm closure of the ring

In 1917, I presented before the New York Obstetrical Society a preliminary report of an operation for cystocele in which I used the lapping, by mattress sutures, of the fascia of the anterior vaginal wall With an experience of eleven years with this method I feel end-results warrant the extensive dissection as originally published An abstract of this technic follows Vertical incision, from 1 cm below meatus to within 1 cm of vagino-cervical junction, through all tissues until bladder can be demonstrated Next the so-called uterovesical ligament is cut and with blunt dissection, gauze covered finger, the bladder base is separated upward from the uterus to the peritoneal fold and well outward on either side from the fascia. When the bladder is freely mobilized then the vaginal mucous membrane is separated, partly by sharp dissection, especially for a short distance on either side of the incision, but for the most part by blunt dissection from the underlying fascia This blunt dissection is carried well outward laterally even to the "arcus tendineus" The fascia is now overlapped with mattress sutures of chromic gut, one or more entering the cervix at about the internal os These sutures draw the underlying fascia smoother under the overlapping fascia and its edge is now attached by interrupted sutures or a continuous suture to the underlying fascia

In 1918, Bissell (14) presented before the American Gynecological Society a paper advocating "lapping of the vaginal fascia in all forms of vaginal prolapse" and in the discussion gave the author priority for the technic just described The Bissell operation for cystocele is a simpler technic to my own but there is less dissection and the fascia lapping is accomplished by means of denuding the mucosa from the side of the vagina to be underlapped rather than separating the mucosa on both sides of the anterior wall In my opinion it is not as applicable to the child-bearing woman because of the possibility of narrowing the vagina

In 1919, Neel (15) reported a method almost identical to my own except for the technic of dissection of the anterior wall This method he presented in 1917 before the California State Medical Society although after a search of the literature, previous to the publication of my technic, I was unable to find a description of his operation Spalding (17) in 1919 published the technic of a supra-cervical hystorectomy, with attachment of the cardinal, utero-sacral and round ligaments to the cervical stump and a lapping of the fascia of the anterior wall by Neel's technic

In 1919, Joseph Halban published a method for cystocele as an essential part of operations for prolapsus uteri He makes a vertical incision through the midline of the anterior wall down to the bladder which he then thoroughly frees from the uterus and fascia Next he frees the vaginal mucous membrane from the underlying fascial structures This technic he ascribes to Winter, H W Freund, Kreuzmann and others Then he cuts the vesico-vaginal fascia from its origin at the cervix on a level with the internal os Next he uses Gesuny's purse string of catgut to pucker and take up the slack and the fascia is attached to the cervix by means of the purse string which at its lower part also penetrates the cervix at the level of the internal os

Conclusions

1 No one operation or any one combination of operations is applicable to every case of Prolapsus Uteri

2 The operative procedure must be based on the site and extent of the injury and our endeavor should be to restore, in so far as possible, the normal anatomical relations of the pelvic organs and structures and their normal functional activity

3 In determining the above we must of necessity take into account the age, the social and economic status of the patient as well as her general physical condition

4 There are now available operations to meet all conditions and with the clarification of the anatomy any one of us can now keep it in mind while operating and thus obtain good functional and anatomic results

5 Retroversion and elongated or diseased cervix must be always remedied as each is a constant source of recurrence of the prolapsus uteri

6 In the child-bearing age the best results are obtained by anatomical repair of the holding or fixing apparatus of the anterior wall with a similar repair of the holding and supporting apparatus of the posterior wall In addition there may be necessary a reefing of the cardinal or utero-sacral or round ligaments

7 If the woman has passed the menopause the above procedures may be indicated but better end

results will be obtained by Interposition or Mayo's operation with the necessary anatomical plastic repair This is due to the atrophy or lack of resistance of the tissues in aged women thus not warranting the amount of dissection necessary for anatomical repair

8 In all cases of prolapsus uteri enterocele must be sort for and repaired as stressed by Ward

PIONEERS IN AMERICAN DERMATOLOGY*

By PAUL E BECHET, M D, NEW YORK, N Y

AMERICAN dermatology is of comparatively recent date, those of us who have nearly reached the half century mark remember with affection a number of these gifted pioneers, who under vastly more difficult conditions, first blazed the trail in that special branch of medicine to which we are devoted Even in Europe dermatology at this time was very young While references to skin diseases are contained in ancient writings such as the Ebers papyrus, 1552 B C, the works of Hippocrates (460-377 B C), the 'De Arte Medica" of Aurelius Cornelius Celci, and a treatise on skin diseases by Hieronymus Mercurialis, nothing of real scientific import was done until the advent of Robert Willan, whose book entitled "Description and Treatment of Skin Diseases," 1808, marked the birth of modern dermatology The celebrated school of Hebra did its best work only in the middle of the last century Europe at the time could only marshal a mere handful of eminent dermatologists The English produced Robert Willan, Erasmus Wilson, and William Tillbury Fox The French, Cazenave, Alibert, Rayer, Devergie, and Bazin The Teutons, Hebra, Bærensprung, Kaposi, and Neumann Our pioneers became versed in dermatology in Europe, but they soon proved a great credit to their teachers by their indefatigable devotion in furthering the specialty in America The difficulties these men underwent cannot be overestimated When Dr James C White entered Tremont Medical School in Boston in September 1853, but a single English textbook on dermatology was known No instruction in the specialty was given by any medical school other than a few lectures given by Dr Henry Daggett Bulkley in New York between 1837 and 1854 Even the German school, later so celebrated, was then practically unknown. No hospital contained a special department for the study and treatment of skin diseases, with the exception of the "Broome Street Infirmary for Diseases of the Skin" in New York City which was opened June 22nd, 1836, under the direction of Henry D Bulkley, who therefor must be credited with being the first one in America to establish a dispensary for skin diseases, and a series of lectures thereon These lectures were begun by him in 1837 at the Broome Street Infirmary, and continued during the next three years at the Broome Street School of Medicine, at the New York Dispensary, and later at the College of Physicians and Surgeons then located in Crosby Street, nine courses of lectures having been delivered here during the following ten years

In 1838 a department for skin diseases was instituted at the Northern Dispensary in New York The first lectureship in dermatology in America, was given to Dr James C White of Boston, by the Harvard Medical School in 1863 In 1871, Dr White became Professor, thereby occupying the first Chair in dermatology in this country A year previously, Dr White was put in charge of the newly created department for skin disease at the Massachusetts General Hospital

In 1865 a lectureship on skin diseases was established at the University of New York, Dr Faneuil D Weisse was the first incumbent In 1865, Dr Foster Swift was chosen lecturer at the Bellevue Hospital Medical College In 1872, Dr Edmund L Keyes received the first appointment to the newly created Chair of Dermatology at the same college. May 18th, 1869, witnessed the founding of the oldest dermatological society

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 22 1928

in the world, at the home of Dr Henry D Bulkley in New York City The New York Dermatological Society was organized through the efforts of Faneuil D Weisse, Henry D Bulkley, Henry G Piffard, and Foster Swift The year 1870 marked the first appearance of a dermatological periodical in America, the "American Journal of Syphilography and Dermatology," under the editorial management of Dr M H Henry of New York

At an informal meeting held in Philadelphia on June 7th, 1876, in the rooms of the Section of Practical Medicine of the American Medical Association, Drs George H Fox, and L D Bulkley of New York, Louis A Duhring of Philadelphia, Lunsford P Yandell, Jr of Louisville, Edward Wigglesworth of Boston, and J E Atkinson of Baltimore, discussed the feasibility of establishing a national dermatological society It was decided that a meeting for organization be held in the University of Pennsylvania, Philadelphia, on Wednesday, September 6th 1876, at 6 P M A letter to that effect was mailed to about fifty physicians interested in dermatology in various parts of the United States Twenty three of them responded, and these together with the six signers of the call, comprised the 29 original members of the American Dermatological Association The following gentlemen were present at the organization Drs J E Atkinson, Baltimore, T R Brown, Baltimore, L D Bulkley, New York, S C Busey, Washington, Louis A Duhring, Philadelphia, C Heitzman, New York, E L Keyes, New York, J A Octerlony, Louisville, H G Piffard, New York, R W Taylor, New York, Arthur van Harlingen, Philadelphia, F D Weisse, New York, James C White, and Edward Wigglesworth, Boston A Constitution and By-laws were adopted, and the American Dermatological Association declared organized Its first Officers were James C White, Boston, President, Louis A Duhring, Philadelphia, and R W Taylor, New York, Vice-presidents, L Duncan Bulkley, New York, Secretary, and James N Hyde, Chicago, Treasurer The first meeting was held in Niagara Falls, September 4th 1877, and was attended by Drs Atkinson of Baltimore, Brodie of Detroit, L D Bulkley of New York, Campbell of New York, Duhring of Philadelphia, George H Fox of New York, Hardaway of St Louis, Heitzmann of New York, Hyde of Chicago, Taylor of New York, van Harlingen of Philadelphia, White of Boston, Wigglesworth of Boston, and Yandell of Louisville Thus began an organization whose influence has been of incalculablt benefit to American dermatology Since this small beginning its sphere of usefulness has increased, and its annual meetings are the most important event in dermatological progress in America

What manner of men comprised this small group of enthusiastic pioneers who in the small space of twenty years transformed a specialty absolutely untaught, even unrecognized, into one of sufficient interest to command a Chair in our great universities, a separate service in our largest hospitals, a national and local Society, and a scientific journal devoted to dermatology? Gentlemen, this growth in my opinion was due entirely to the unselfish and untiring efforts of this small body of men, and not to the natural development of the specialty I think that we cannot do them too much honor It is very easy, particularly among the youngest of us, surrounded as we are by modern technical methods, and advanced scientific research, to give little thought to the men of the past I will remind you of a single example, does it occur now to those of us using endothermy, the Grenz rays, radiotherapy, etc., in the removal of epitheliomas that some thirty or forty years ago Sherwell of Brooklyn, introduced thorough curettage and cauterization with acid nitrate of mercury, with results fully as equal as those we attain today? Yet such is an actual fact It would prolong this paper too much to enumerate at length the individual deeds of each of these pioneers, suffice it to state that James C White of Boston (1833-1916), was the first President of the American Dermatological Association, and the first to occupy the Chair of Dermatology at a great college (Harvard University) He was President of the Sixth International Dermatological Congress held in New York in 1907 He contributed 125 original articles to medical literature He was dignified and austere in manner, yet extremely kind and courteous He was a painstaking teacher, and conducted scientific sessions with decorum, and meticulous order He did not hesitate to criticise in a constructive manner, even when his personal interests were endangered thereby

Henry Daggett Bulkley of New York (1804-1872), studied dermatology in 1831 under Cazenave and Biett at the Hospital St. Louis On his return to New York he took up the practice of dermatology

The organization meeting of the New York Dermatological Society was held at his home, 42 East 22nd Street In 1845 he translated a work on dermatology by Cazenave At different times he became President of the New York Academy of Medicine, and the New York County and State Medical Societies

Dr Samuel Sherwell of Brooklyn (1841-1928), was a pioneer in dermatology in that Borough He studied abroad under Hebra, joined the Anglo-American Ambulance Corps with Dr Marion Sims, and Sir William McCormack, during the Franco-Prussian war, and received from the Bavarian government the military Order "pour le merite" He returned to Brooklyn in 1871 In 1877 he was appointed lecturer on diseases of the skin at the Long Island College Hospital, and later became its first Professor He served this

institution faithfully for thirty years Dr Sherwell was twice President of the New York Dermatological Society, and once of the American Dermatological Association Dr Sherwell lived long and interestingly His "Recollections of an Old Boy" makes fascinating reading He was particularly fond of the New York Dermatological Society, in which he was elected to active membership in 1873, and honorary membership in 1920

Dr William H Draper of New York (1830-1901) was a charter member of the New York Dermatological Society and at that time a professor of Diseases of the skin in the College of Physicians and Surgeons He was well versed in his specialty, but was also interested in general medicine

Dr Faneuil D Weisse of New York (1842-1915), was a student under Erasmus Wilson He was practically the founder of the New York Dermatological Society He wrote little on dermatology, but was greatly interested in it, and particularly gifted in stimulating the interest of his fellow workers in the subject.

Dr Frank P Foster of New York (1841-1911), was a very scholarly man, he was elected to the American Dermatological Association in 1877, and was for many years a member of the New York Dermatological Society He also edited the New York Medical Journal

Drs Henry G Piffard (1842-1910), Robert W Taylor (1842-1908), Edward L Keyes (1843-1924), A R Robinson (1845-1924), did much to advance dermatology in New York City

Dr George Henry Fox was born at Ballston Spa, Saratoga County, New York, on October 8th, 1846 I feel sure that if the State of New York was aware of this, and knew Dr Fox as well as we do, they would claim that their Saratoga water was the object of Hernando de Soto's quest, and literally the "Fountain of Youth," as the only sign of age which I can perceive is his devotion to geneology It is an astonishing thing to observe his activity in everything, and then realize that he began the practice of dermatology in the Fall of 1873, fifty-five years ago! In that span of fifty-five years he has received every possible dermatological honor, the enumeration of which would in itself make a long article. He has done as much, if not more than any man in this country in furthering the interests of dermatology Among his innumerable activities is photography, in which he first became interested at the Northwestern Dispensary He soon had a large collection of photographs of varied dermatoses which resulted in the publication in 1880 of "Photographic Illustrations of Skin Diseases" other editions followed in 1881, and 1885 "Skin Diseases of Children" was published in 1897 He wrote many monographs and articles throughout his long period of activity He was elected Honorary President of the American Dermatological Association at its Golden Anniversary Meeting in May 1926, fifty years after he had been present at its organization He was President of the New York Dermatological Society four times, and is at present its only living honorary member The most outstanding feature of his beautiful character is his extraordinary sense of modesty, this is so well exemplified in his "Reminiscences" I am sure that of all the honors he has received, he thinks most of the love and admiration which we feel for him His stories and reminiscences of his early associates is a source of vast delight to those of us who are fond of medical lore

Philadelphia produced in the person of Dr Louis Adolphus Duhring (1845-1913) a master in dermatology Dr Duhring after graduation from the University of Pennsylvania in 1867, and an internship in the Philadelphia Hospital, went abroad and devoted himself assiduously to the study of dermatology under Hebra in Vienna, and also in Berlin, London, and Paris, His vacation periods were spent in the study of leprosy in Constantinople and Norway He was one of the founders of the American Dermatological Association, and twice its President. He wrote the first American text-book on skin diseases in 1877, which ran through three large editions He also brought out a chromolithographic atlas of skin diseases, and projected an encyclopedic work on diseases of the skin to be issued in parts, and entitled "Cutaneous Medicine" The first part appeared in 1895, and the second in 1898, but it was never completed. He was prolific writer, a score of articles were on the subject of dermatitis herpetiformis, which disease bears his name. Dr Duhring soon received the appointment of clinical lecturer at the University of Pennsylvania, then advanced to clinical Professor, and later full Professor, a post which he filled with great honor from 1875 to 1910 Dr Duhring was a great teacher, and a clear, comprehensive, and accurate writer His descriptions of dermatitis herpetiformis are masterly in form and clarity

In his clinical work he was never satisfied until he had gone over a completely stripped patient from head to foot In his later years he became much less active, and devoted much time to financial speculation When he died on May 8th, 1913, he left, to every one's astonishment, more than a million dollars, which after generously providing for relatives, he devoted to his Alma Mater, medical societies, and charities His most faithful associate, Dr Arthur van Harlingen of Philadelphia, was also a founder of the American Dermatological Association He was a fellow interne of Duhring's at the Philadelphia Hospital in 1867, and assisted him in the Dispensary and Out-Patient Department of the University Hospital Dr van Harlingen helped found the Philadelphia Polyclinic in 1885, and became its first Professor of Dermatology He illustrated with pen and ink drawings the second edition of Dr

Duhring's "Treatise on Skin Diseases," and published a "Handbook of the Diagnosis and Treatment of Skin Disease," which ran through a number of editions This book contains tables of the differential diagnosis of the commoner dermatoses, which are of great practical value Among the early dermatologists Dr James Nevins Hyde of Chicago (1840-1910) holds high place He won many dermatological honors, and was a tireless worker, fluent speaker, and a forceful writer His textbook is an important contribution to American dermatology

William Augustus Hardeman (1850-1923) of St Louis, graduated from the Missouri Medical College in 1870 He taught hundreds of medical men in the South and middle West. Dr Charles E Michel of St Louis originated electrolysis for the removal of superfluous hair, but it was Hardaway who introduced it in dermatologic practice

In conclusion I wish to acknowledge my indebtedness to the autobiographies of Drs James C White, George H Fox, and Samuel Sherwell

I also wish to express my thanks for the great help rendered me by Dr George Henry Fox of New York, and Dr Arthur van Harlingen of Philadelphia Their assistance has been invaluable

---

THE USE OF SMALL DOSAGES OF PITUITARY EXTRACT TO INDUCE OR SHORTEN LABOR AT TERM*

History of the Method and Report of an Additional Series of Cases

By ARTHUR STEIN, M D, F A C S, NEW YORK, N Y

ALTHOUGH the stimulating action of pituitary extract upon the uterus is fully recognized, it has been generally taught that this drug should not be used in obstetrics until after the child has been born, because of the danger of rupturing the uterus Yet a review of the literature and my own experience prove that, when pituitary extract is administered in *small and frequently repeated doses* before delivery, it offers a safe and effective method of inducing and shortening labor at term

Historical Data

Bell[1] in 1909 was the first to use pituitary extract extensively in obstetric practice, but he believed that it should rarely be employed before delivery Watson[2] in 1913 recorded three cases in which he successfully administered pituitary extract to induce labor Watson's method differed from my own, since he employed a considerably larger dosage, (10 minims) His plan was to begin with this dose, administered intramuscularly through a long needle As a rule, uterine contractions began in about ten minutes and increased in severity during the next twenty minutes At the end of this time, Watson advised the second injection of 8 minutes He stated that as many as six to eight intramuscular injections of pituitary extract may be given at intervals of one-half hour without any harmful effects whatsoever and that the effects of a single dose of the drug last only about one-half hour and there is no cumulative action However, the contraction phase of the uterus following the intramuscular injection of a small dose of pituitary extract has been shown experimentally by Bourne and Burn[17] to last about an hour or a little longer

So far as I have been able to ascertain the essayist was the first in 1917 to employ very small dosages, namely 3 minims, for *inducing* and *shortening* labor at term

Realizing the danger of violent contractions and rupture of the uterus following very large dosages but appreciating the advantages of the judicious use of this drug as a uterine stimulant, I employed 3 minim dosages

The uterine contractions induced by these small dosages were of the normal, rhythmic and physiologic type In cases in which pituitary extract was not given until the cervix was fully dilated, the duration of the second stage of labor was definitely shortened In all cases in which labor was induced by this method, the mothers did well and the infants were born in excellent condition The dosage recommended was the smallest employed up to that time, since the customary dose was 1 c c or somewhat less In two later communications[6] I showed that the induction of labor with minimal doses of pituitary extract may advantageously be combined with nitrous oxide anesthesia during delivery

A review of the replies [8], [9], [10], received from a questionnaire sent out by the Revue française de gynécologie et d'obstetrique to French obstetricians shows that the usual dose employed by them is still 8 to 15 minims

Scott[11] in 1926, reported a study of the response to a questionnaire sent to representative American obstetricians in regard to the use of pituitary extract to induce labor and states in his conclusions "there is almost unanimous opinion among those using this method that the original dosage as proposed

*Read at the Annual meeting of the Medical Society of the State of New York Albany, N Y, May 22nd, 1928

by Dr Watson is too large and they either use smaller doses throughout or start with smaller doses and increase slowly"

Other obstetricians who have reported favorable results following the use of small doses of pituitary extract for the induction or acceleration of labor include Delèstre[9], Hauch[10], Framm[12], Gossett[13], Silzer[14], Mathieu[15], Adler[16], and Bourne and Burn[17] Calmann[18], in 1928, reported that he had employed my method to induce or shorten labor in approximately seven hundred cases and that his results were uniformly good He did not observe a single instance of tetanus uteri from the small doses of pituitary extract administered

Method

The method as I have practiced it is as follows

7 A.M. Castor Oil, 1 ounce.
9 A.M Pituitary Extract, minims 2 (per hypo deep into thigh)
10 A.M Pituitary Extract, minims 2 (per hypo deep into thigh)
11 A.M. Pituitary Extract, minims 2 (per hypo deep into thigh)
Noon Pituitary Extract, minims 2 (per hypo deep into thigh).

Originally I employed 3 minims doses, but 2 minims have proved equally satisfactory If labor pains are initiated, injections of 2 minims are continued at intervals of one hour If no pains are produced, the treatment is stopped and a similar attempt made on the third day succeeding I have never observed any ill effects either to mother or child from repeated injections of the extract, and as many as ten or more may be given The drug apparently has no cumulative effect.

When the induction of labor is successful. the pains generally begin after the second dose In about one-third of the cases in my earlier series[4] , a single dose proved sufficient to induce labor In some women, no response to pituitary extract administered for the purpose of inducing labor can be obtained

Small doses of pituitary extract may be used not only to induce labor but also to assist the pains during labor in cases of uterine inertia For this purpose, a series of injections of 2 minims each may materially lessen the duration of labor and thus diminish the hazards to the infant resulting from prolonged compression of the fetal skull When labor has been induced or accelerated by pituitary extract, nitrous oxide anesthesia may be employed during the 2nd stage, as it does not impair the force of the uterine contractions[5]

In a new series of thirty-three well observed cases 2 minim dosages of pituitary extract were given for the induction of labor at term In 79 per cent of the cases labor was induced at the first attempt. In 6 per cent a second attempt was required, in 15 per cent, a fourth A single injection of 2 minims succeeded in inducing labor in 7 per cent of the cases in this series

The preparation of pituitary extract which I employed in the cases reported in this article was pituitrin, the Parke-Davis product

TABLE

Thirty-three Cases in Which 2 Minim (0 12 c.c.) Doses of Pituitary Extract Were Used to Induce Labor at Term

Case	Para	Age	Number of Injections	Attempt which succeeded
1	P	40	1	1
2	M	35	6	1
3	M	32	3	1
4	P	34	3	1

30	P	28	7	1
31	P	24	4	2
32	P	27		4
33	P	21	9	1

In no case was any harmful effect on mother or child observed

Summary

Although pituitary extract is known to be a powerful stimulant of the uterine muscle, com-

paratively little advantage has been taken of this pharmacologic action because of a widespread fear of causing rupture of the uterus, but such accidents, when they occur, have always been due to the use of very large doses In my experience, the use of very small dosages, frequently repeated, offers a useful method of inducing normal labor at term or of shortening labor in cases of uterine inertia Sometimes a single dose of 2 minims will induce labor More often, the dose must be repeated several times There is no objection to giving eight or ten doses, provided that they be given in small quantities The danger of pituitary extract is not in the total amount administered during twenty-four hours, since the effects of the drug on the uterus are not lasting and there is no cumulative action, but in the use of too large dosage at *one* time, whereby a tetanic contraction of the uterine musculature may be produced I have never observed any ill effects to mother or child from the use of small and repeated doses of the extract to induce labor

OVULATION IN MAN AND MAMMALS*

By GEORGE N PAPANICOLAOU, M D, NEW YORK, N Y
From the Department of Anatomy, Cornell University Medical College, New York City

THE process of ovulation or the rupture of ripe follicles in the ovaries begins with the attainment of sexual maturity The immature ovary contains small and medium sized follicles, which grow to a certain size and then regress and degenerate When sexual maturity is reached, a number of follicles grow larger, come out to the surface of the ovary and finally rupture, evacuating their content into the tubes The rupture is greatly facilitated by the accumulation of a large amount of follicular fluid within the large follicles In the mammals the ruptured follicles form a new organ, the corpus lutem, which elaborates specific substances needed chiefly in the normal progress of implantation and pregnancy

Ovaries of immature animals implanted into sexually mature females (after removal of their own ovaries) have shown a rapid growth of follicles and have begun to ovulate within a week, although the animals from which such ovaries have been taken were not expected to reach their sexual maturity before the end of two months This experiment, made by Long and Evans (7), shows that the ripening of the follicles is not determined only by intrinsic factors residing in the follicles themselves or in the ovaries, but also by other environmental conditions Recently Smith (10) succeeded in inducing precocious sexual maturity in female animals by daily transplants

This work has been aided by the Committee for Research on Sex Problems of the National Research Council.
* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, May 23, 1928.

of the anterior pituitary of the adult On the other hand it has been shown that the anterior hypophysis has a stimulating effect upon the growth of the follicles Under the influence of the pituitary treatment the number of normal follicles and of corpora lutea increases in the ovary and a superovulation, i e, a liberation of an unusual number of ova, invariably occurs (11)

The process of ovulation has a rhythmical expression in the mammals The follicles grow and either rupture or degenerate in a regular cyclic succession Some animals, called polyoestrous, display a continuous return of sexual cycles and ovulations, others, called monoestrous, have only one or two cycles in a year, usually associated with certain seasons During the periods of sexual activity the genital tract becomes highly congested and shows a pronounced hypertrophy The ovaries are also congested and enlarged and the large follicles show extensive vascularization around their theca. This congestion is also contributing to the final rupture of the follicles

In most mammals ovulation is spontaneous, i e., at the end of every period of sexual activity, whether copulation occurs or not, there is a maturation and a spontaneous rupture of follicles In a few mammals, the rabbit, the cat and the ferret, ovulation does not normally occur without copulation. Thus copulation seems to be a factor stimulating the maturation of the follicles and acts either by increasing the congestion in the genital tract or by indirectly affecting the endocrine mechanism through the sympathetic system

In monkeys, ovulation is spontaneous, as it is in the human, but may often fail to appear Recent as well as older investigators (1, 2, 6, 12) have emphasized the fact that female monkeys may menstruate repeatedly without any apparent signs of ovulation. Such a suppression of the ovulative process is rather exceptional in normally menstruating women Investigators in the human field seem to agree on this point. Cases of menstruation without ovulation and of ovulation without menstruation, however, have been observed and used as argument by those who have disputed the close interrelation between menstruative and ovulative phenomena The fact that an ovulation or a menstruation may be eventually suppressed does not necessarily mean that one is independent of the other It only means that each has a certain independence in its mode of expression Menstruation is caused by catabolic phenomena occurring mainly in the uterine mucosa, whereas, ovulation is associated with catabolic processes occurring in the ovary at a different time. One represents the destruction of the excessively hypertrophied uterine mucosa, the other, the abrupt degeneration of the greatly enlarged follicles These two fundamental phenomena may occur at times without any external manifestations An insufficient growth of the uterine mucosa and its poor vascularization, caused by factors acting adversely at the premenstrual period, may have as a result a poor catabolic process and a lack of menstrual bleeding An insufficient growth of ovarian follicles during the postmenstrual period may lead to an abrupt atretic process instead of the expected follicular rupture. This will prevent the formation of a typical corpus luteum although its secretion may be partly substituted by the theca cells of the resulting atretic follicles, which at times show a pseudoluteal transformation.

A strict coordination between oestrus and ovulation seems to be the case in all mammals During oestrus there is a period of sexual desire, when copulation occurs, and this is normally followed by ovulation Thus, when the rupture of the follicles takes place, the spermatozoa are already advanced into the tubes, where the ovum is usually fertilized

As a rule ovulation follows oestrus, and oestrus follows the appearance of an excessive congestion Thus we have a regular succession of three definite periods one is the congestive, second the copulative, and third the ovulative. In most of the lower mammals the congestive period is poorly expressed and not revealed externally by actual bleeding, as in higher forms On the other hand, the copulative or oestrous period has lost its typical expression in the higher mammals and especially in the primates, which have been deprived of the reaction of displaying a strong sexual desire at a definite time of the cycle The morphological expression and the regular succession of all three periods seems to be present however, in all mammals

The above fact can be well shown by the comparative study of vaginal smears With the aid of this method, which consists in examining microscopically the fluid content of the vagina, certain missing stages may be finally recognized and identified Thus recently I have been able to recognize a typical congestive or pseudomenstrual stage in the guinea pig, which closely resembles the menstrual stage of the woman. On the other hand, by the use of this same method in women, a definite copulative stage can be recognized, which is placed, as expected, between the congestive or menstrual and the ovulative stage This copulative stage is characterized by an excessive cornification and a decrease in the number of leucocytes, which usually reappear at ovulation. Thus a complete analogy can be established between the various stages of the sexual cycle in the woman and in the other mammals.

The three periods, congestive, copulative and ovulative have a short duration in lower mammals, especially in rodents In the guinea pig, all three periods last only two to three days In the woman, on the contrary, they last about twelve to thirteen days, showing extensive prolongation The congestive or menstrual period

lasts four to six days The copulative, which follows, starts at the eighth or ninth day and reaches its highest expression at the tenth to twelfth The ovulation seems to occur normally at the twelfth to fourteenth day The human cycle is thus prolonged by several days The prolongation occurs mainly between the first day of menstruation and the ovulation, i e, during the time when follicles complete their final development

The large follicles are very delicate and sensitive structures and their growth may be easily disturbed by various factors An acceleration or a retardation of the follicular growth may eventually occur In such cases, the whole period is usually shortened or prolonged In one of the cases which I have observed, maturation of the follicles was evidently completed and ovulation occurred as early as the seventh day The following menstruation appeared two weeks late, i e, at the twenty-first day

Cases of retardation are more numerous As a whole, the human cycle shows a great variability Typical normal cases, running regularly over a long period of time, are rather rare Out of several normal cases which I have followed, one has shown a regular periodicity and a typical succession of vaginal smear stages The complete menstrual history of this case, extending over a period of eighteen consecutive years, shows an average of about 25 17 days The ovulation periods, which I have studied accurately by taking daily vaginal smears, occurred at the 12th to 13th day

These findings are in support of the view that ovulation occurs normally in the mid-interval and not during or immediately after menstruation The menstrual phase corresponds evidently to the prooestrus, whereas ovulation, as a rule, comes after oestrus Most of the gynecologists, who have examined human ovaries at different stages of the cycle, place ovulation mostly between the 13th and the 19th day after onset of menstruation (4, 8, 9) Their observations, though largely based on pathological cases, are very valuable, as long as we are in lack of a sufficient number of exact data obtained from strictly normal cases During the mid-interval, especially between the 10th and 15th days, Frank and Goldberger (5) found an increase of the follicular hormone in the blood of the woman This might be interpreted as being due to the increased secretion and absorption of follicular hormone during the final growth stages of the follicles In monkeys, Corner (2) and Allen (1) found ovulation at the 10-14th day, i e, at about the same time as in the human

As stated above, copulation is a factor which stimulates the follicular growth In guinea pigs the onset of oestrus and ovulation may be accelerated by one or two days, when matings are made during prooestrus Such an acceleration may also occur in human Statistics show that the time of the greatest fertility in the human female is towards the end of the congestive period (prooestrus) and at the early part of the copulative (oestrus) Dickinson (3) has recently tabulated the results of various investigations along this line, made especially during the great war The highest point of fertility is shown by them at the 8th day after onset of menstruation, which is actually the day when the copulative period begins These results can be explained by the assumption that the sexual excitement and intercourse have a stimulating and accelerating effect upon the follicular development

THE QUARTERLY INDEX

This issue, page 836, contains the second quarter's index of the activities of the Medical Societies of the States and Counties, that for the first quarter having appeared on page 411 of the April first issue One great value of the index is that it shows what the Societies of other States are doing Practically every topic that has come before the New York Society has also been considered in other states A familiarity with the activities of other State Societies will reveal their sources of failure and the elements of their successes

lasts four to six days The copulative, which follows, starts at the eighth or ninth day and reaches its highest expression at the tenth to twelfth The ovulation seems to occur normally at the twelfth to fourteenth day The human cycle is thus prolonged by several days The prolongation occurs mainly between the first day of menstruation and the ovulation, i e, during the time when follicles complete their final development

The large follicles are very delicate and sensitive structures and their growth may be easily disturbed by various factors An acceleration or a retardation of the follicular growth may eventually occur In such cases, the whole period is usually shortened or prolonged In one of the cases which I have observed, maturation of the follicles was evidently completed and ovulation occurred as early as the seventh day The following menstruation appeared two weeks late, i e, at the twenty-first day

tute a large proportion of the members of every medical society, and in some counties they are the dominant group These specialists in public health form the group from which the leaders in public health of any county may be drawn

The District Health Officers of the New York State Department of Health, fifteen in number, form a group who may be liaison officers in public health between the county societies and the State Medical Society, just as they are liaison officers between the local health officers and the State Department of Health

The establishment of contacts between the State Medical Society and the State Department of Health will have its counterpart in similar contacts of county societies with local health officers The establishment of these contacts will remove the possible ground of criticism that members of county societies are not qualified in public health and civic medicine

THE MINUTES OF THE HOUSE OF DELEGATES

The accomplishments, policies, and aspirations of the Medical Society of the State of New York are set forth in the annual reports of the officers and committeemen printed on page 505 of the May first issue of this JOURNAL What the members of the House of Delegates think of them is stated in the Minutes which are printed on page 824 of this issue of the JOURNAL These minutes will form the basis on which the officers and committeemen will act during the coming year

The printed minutes of the House of Delegates have been prepared in a form which will promote their clear understanding and easy consultation Each item has been given a title and has been numbered References by JOURNAL page are made to the particular annual report on which each item is founded, and there is added the number of the section in which the action taken may be found An index of the topics appears at the end of the minutes All this is necessary in order that the reader may easily find the item for which he looks, and the action which was taken

A careful reading of the Journals of other State Societies does not disclose any annual reports or minutes of the House of Delegates which approach those of New York in completeness and ease of reference The records of New York State are of special value for two reasons

1 Their intrinsic worth

2 Their clearness and adaptability for ready reference

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

National Bureau of Medicines and Foods Twenty-five years ago the House of Delegates of the American Medical Association considered plans to establish a "National Bureau of Medicine and Foods" This JOURNAL for July, 1909, records that Dr E Eliot Harris, of New York, who was chairman of a special committee on the subject, gave a report in favor of a Bureau which would "Certify to the standards of identity, purity, quality, and strength of such articles as may be determined to be worthy by the board of experts and of no others, and relieve the physicians, in the manner outlined, of the doubt and uncertainty as to the nature, composition or reliability of the medicines which they are requested by representatives of various houses to prescribe or employ"

The committee stated that since there was no apparent hope that the United States Government will provide for the inspections and certifications, the American Medical Association was the natural body to undertake the work

The report was referred to the Reference Committee on Medical Legislation, and was later considered by the House of Delegates as a Committee of the whole which reported unfavorably The House of Delegates sustained the report The matter was dropped, but the principles involved were later incorporated in the present Council on Pharmacy and Chemistry of the Board of Trustees of the American Medical Association The Federal Trade Commission has also been authorized to have jurisdiction over foods and drugs

THE SPECIALTY OF PUBLIC HEALTH

The Medical Society of the State of New York reflects the activities of the medical societies of the counties One of the major activities of the State Society is the promotion of the practice of public health and civic medicine Medical societies are engaging in the practice of public health and civic medicine as distinguished from their science and theory If a method or theory does not work out properly, the doctors are blamed, for it is they who apply the treatments to the patients, either individuals or civic organizaions

The leaders of the Medical Society of the State of New York have promoted the doctrine that members of the county medical societies should assume the leadership of the practice of civic medicine This attitude has been criticized on the ground that the practice of public health is a specialty in which the average doctor is not qualified The criticism has been made that failure has sometimes followed the attempted assumption of public health leadership by county societies

Let us take an actual example of the criticism A County Board of Supervisors is ready to establish a public health nursing service, to be directed by a committee named by the county medical society But the county society named a committee whose members have had no experience in public health work, and are uncertain how to direct the nurses The critics made the point that the State Medical Society has been wrong in insisting that county societies should assume the leadership of public health because the majority of the members did not know how to carry on public health

The critic was right when he said that public health is a specialty Directing the public health nursing service is a specialty, for the nurses will engage in epidemiological research and in the prevention of contagious diseases They will secure medical histories and will give medical treatments prescribed by doctors to people in their home, and will give advice in preventive medicine The doctor who is not familiar with these forms of the practice of medicine will not be qualified to direct a public health nursing service

Where will public health specialists be found in rural sections of New York? Every rural township and village has a health officer, and there are over five hundred of these rural health officers in the State. The great majority of these health officers have taken courses in public health sponsored by the State Department of Health, and all of them have worked under the practical directions of the District State Health Officers

The health officers may not be qualified as experts according to the standard like that applied to the surgeon, but they are qualified and experienced in public health in the same way that a family doctor is qualified and experienced in surgery

Every county in New York State has a sufficient number of health officers qualified to act as public health specialists, and to direct the public health nursing service in the county There will be no difficulty in finding a sufficient number of health officers to make up an efficient public health committee of any county medical society A public health committee without a health officer is like a hospital committee without a surgeon on it.

The Committee on Public Relations of the Medical Society of the State of New York has always advocated the choice of experienced public health workers as members of the local public health committees of county societies It has especially insisted that the chairmen of the local committees shall have the additional qualification of ability in leadership

How shall the public health leaders in county societies be secured? The State Committee on Public Relations does not assume that every doctor is a specialist in public health, any more than he is a specialist in surgery, but the state committee does assume that every county contains a number of health officers and other doctors whose qualifications and temperament fit them to be chairmen of public relations committees

The Public Relations Committee of the State Medical Society stands ready to assist the local county societies in securing "key-men" to be chairmen of the county committees of public health and public relations Each committeeman of the State Society has been assigned a number of county societies whose officers will be ready to give instruction in the methods of performance of those phases of public health administration for which doctors are especially responsible. The work is new, but progress has been rapid (See page 1432 of this JOURNAL of December 1, 1928)

The State Public Relations Committee has dealt with four groups of health organizations first, it dealt with two groups of lay organizations,—the state and the local An example of the work with these two groups is that with those engaged in public health work in Cattaraugus County, which has gone so far with these groups as to lead to the adoption of the eight agreements which were printed on page 494 of this JOURNAL of May 1, 1928

In the second place, the Public Relations Committee has also dealt with the official groups which compose the State Departments of Health and of Education, as is reported on page 526 of this JOURNAL of May 1, 1929

There remain the local groups of official public health workers composed of local health officers and boards of health These physicians consti-

tients In this group Einhorn's duodenal alimentation may be tested and the authors modify this only by passing the sound further down —to the extent of a maximum of 120 cm With the retention sound passed through the nose the patient receives daily 40 calories for each kilogram of body weight of fluid food—butter, milk, eggs, cane sugar, fruit juices, etc, the milk having been peptonized first, and the entire meal passed through a fine hair sieve The mixture must be injected 100 cc at a time In the past 2 years the authors have treated in this manner 63 patients with gastric or duodenal ulcer with uniformly good results, not a single failure having been recorded The ulcer pain subsided at once and permanently In summing up, the authors state that jejunal alimentation is a dependable resource in any form of peptic ulcer, even including the postoperative jejunal type Naturally other and simpler plans are to be tried first, holding this as a reserve In regard to other affections amenable to this plan of treatment, the authors mention especially chronic gastritis, the diagnosis having been established beyond doubt through the use of the gastroscope The only contraindications are the acute, bleeding ulcer and ulcer with pyloric stenosis, but aside from such special conditions it may prove that medical treatment will supersede some of the former surgical interventions, for surgery cannot claim 100 per cent cure as happened in the authors' present series Many of the patients will be able to feed themselves after having been taught how, and a hospital sojourn or prolonged rest in bed will be unnecessary —*Klinische Wochenschrift*, April 9, 1929

Results of Research into Encephalitis —Professor F Sioli, psychiatrist at Dusseldorf, states that encephalitis forms one of the great problems of the day It has been under intensive study since 1917 and we are only on the threshold of our knowledge of it, for it seems rapidly changing its type and also appears under new forms This study has ramifications into other subjects, including the anatomy and physiology of the nerve centers and psychiatry We have had to study anew the phenomena of sleep and wakefulness, of muscular tone, of the vegetative nervous system and the extrapyramidal conduction path The old view of the supremacy of the cerebral cortex for psychic behavior seems to have been shattered for all time Much behavior which we term instinctive or compulsive, may be brought into direct association with the subcortex There is the peculiar association of psychic with motor anomalies which somehow suggests the association of dementia precox with catatonia Psychic and motor anomalies shade into one another without any apparent transition In the undeveloped child especially we see the association of parkinsonism with changes in the personality We can visualize now that organic lesions are able to change the entire character and personality and render a normal subject quite antisocial Professor E Redlich of Vienna follows this article by one on abortive forms of encephalitis In such cases we may assume the existence of small scattered foci in the brain or cord Naturally in the absence of a causal or treatment test the diagnosis must remain in doubt—that is, as regards the encephalitic nature of the lesions In several histories given the lesions were in the cerebrum, basal ganglia, or spine The symptoms naturally show great variation and a tendency to self-limitation, and eventual improvement or recovery is noted both in these abortive and in the fully developed forms — *Deutsche medizinische Wochenschrift*, April 5, 1929

Treatment of Middle Ear Suppuration.— Hassan Bey Shaheen calls attention to the well known fact that diseases of the middle ear, whether of the dry or suppurative type, tend to run a chronic course unless they are dealt with promptly and energetically Dry conditions of the middle ear which have failed to derive benefit from catheterization and massage frequently respond to treatment by intravenous injection of colloid iodine Suppurative otitis media, however, is a far more serious type of disease, and failure to treat it adequately has undoubtedly been responsible for a large number of operations on the mastoid process The writer has been able to cure many of these patients by the subcutaneous or intramuscular injection of milk boiled for three to ten minutes and injected at body heat in adult doses of 5 to 10 c c The treatment has the two advantages that it is cheap and is within the province of the general practitioner One injection is sometimes sufficient to stop the discharge, though in cases with small granulations and a fetid discharge several injections may be necessary The injections are often followed by severe general symptoms resembling those of an attack of influenza The reaction usually begins within an hour or two of the injection, and most of the effects pass off within twenty-four hours, but in view of the fact there is sometimes pyrexia lasting two or three days, rest in bed should always be enforced By carefully regulating the dose, children may be submitted to the treatment without undue suffering The contraindications are cardiac or renal disease The writer feels confident that the general use of this method would be followed by a great reduction in the number of operations performed on the temporal bone, and that the radical mastoid operation would be performed only in cases of cholesteatoma or when intracranial complications are threat-

MEDICAL PROGRESS

Spinal Anesthesia Fatalities and Their Prevention—L L Sise reports that in about a year, during which spinal anesthesia has enjoyed a great wave of popularity, there have occurred in Greater Boston at least 11 deaths due directly to its use, and 3 other deaths of which it was probably the cause While spinal anesthesia is a very valuable method, it is dangerous unless used with great care, and by an anesthetist well trained in the technique of its administration From his experience in one fatal case and in a number of cases showing various degrees of vascular depression, Sise has developed a plan of prophylaxis and preparation for any extreme emergency Spinal anesthesia is not safe for poor risks—those whose bodily vigor is low from any cause Fluids given before anesthesia add greatly to its safety The solution commonly employed by the writer consists of 1500 c c of saline and 50 gm of glucose by hypodermoclysis Ephedrine is so effective as a prophylactic that its use is well nigh universal For an abdominal operation, with the patient in the Trendelenburg position, 50 mgm of novocaine is usually sufficient, with the patient level, 75 to 100 mgm may be used It is unwise to exceed this amount Injecting the solution with the patient sitting up is taking an unnecessary risk It is unwise to use a heavy solution for abdominal operations, for if the Trendelenburg position is assumed the fluid is apt to gravitate to vital nerve centers in the medulla Vascular depression should be carefully watched for and should receive early treatment The blood pressure should not be permitted to fall below two-thirds of its preoperative level Great care must be exercised if general anesthesia is superimposed on spinal anesthesia

For combating vascular depression epinephrine is preferable to ephedrine, ¼ c c of a 1 1,000 solution is usually effective Before starting the anesthesia every preparation for a grave emergency should be in readiness—the saline infusion apparatus, gas machine, syringe, and epinephrine If serious emergency arises, the anesthetist gives the alarm, tips the patient into high Trendelenburg position, and gives, as indicated, oxygen, carbon dioxide, or artificial respiration When he gives the sign, the operating nurse fills the syringe with epinephrine, which the surgeon injects into a vein in the field of operation These acts can be completed within one minute If the heart has stopped beating, the surgeon should inject epinephrine and follow this with cardiac massage—*New England Journal of Medicine*, May 23, 1929, cc, 21

Emetine Poisoning—F G Cawston, writing in the *Journal of Tropical Medicine and Hygiene*, January 15, 1929, xxxii, 2, warns against the prolonged administration of small doses of emetine, since they are more to be feared than heroic doses during the first few days of treatment Although emetine is commonly injected daily, the use of larger doses on alternate days is preferable, as it enables the system to recover from the toxic effects of one dose before the next is given The cumulative action of the drug occurs independently of whether the doses have been given orally, intramuscularly, or intravenously Local reaction is avoided by using pure preparations, by diluting with 1 per cent carbolic lotion, and by avoiding the same portion of the muscle for more than one injection The curative dose of emetine for schistosomiasis seems to be just double that required for amebic dysentery For bilharzia disease the maximum total dose, which is also the required dose, is about 1 grain for each year up to the age of twenty Albumin in the urine toward the end of a course of relatively large doses, such as are justified in the treatment of bilharzia disease, is one of the most important danger signals of emetine poisoning The earliest signs of paralysis are seen in the increase of pulse rate from the irritative action of the drug on the nerve endings supplying the heart muscle Further use of the drug results in looseness of the bowels, weakness of the legs, or definite paralysis of some nerve endings Cardiac stimulants should be used at the earliest possible moment after signs of the cumulative action of emetine become evident In dysentery emetine should be given both orally and intramuscularly, it is doubtful whether intravenous injections are ever required Sulphate of sodium should be more extensively employed, as repeated doses over a period of five days help to remove the amebas that are lying loose in the lumen of the bowel and also those lying near the surface of the mucosa By this combination of treatment there should be less danger of the production of emetine-fast parasites As soon as symptoms of emetine poisoning are recognized the patient should be put to bed for forty-eight hours If the symptoms are not too pronounced, good effects may result from a hot sea-water bath

Jejunal Feeding—Professor P Morawitz and Dr N Henning, of the internist clinic at Leipzig refer chiefly to the treatment of peptic ulcer by jejunal alimentation After all other resources have been tested, as the rest cure, the Sippy diet, the alkaline treatment, etc, we still find ourselves helpless in a group of pa-

ing bacilli This action, however, did not appear in the first five months of treatment, but at a later period, showing that the tellurium is very slowly absorbed Further observations are required before a decisive conclusion can be reached regarding the value of the treatment —*Journal of Tropical Medicine and Hygiene,* February 1, 1929, xxxii, 3

Scarlet Fever Sepsis —Dr Alice Chassel of the department for infectious diseases of the Hamburg-Barmbeck Hospital discusses this subject from the two-fold standpoint of the severity of this complication of scarlet fever and the fact that the prognosis is not so grave as at first sight appears During the year ending Dec 15, 1928, the total number of cases of scarlet fever treated was 694 and in this large material there were found 18 undoubted cases of sepsis, or something under 3 per cent The figures of other clinics show the greatest variation—all the way from about 1 to 20 per cent. The diagnosis was established either by the presence of hemolytic streptococci in the blood or by the occurrence of multiple metastases containing this organism In most of the cases both of these criteria seem to have been present Of four cases of special interest reported, the first patient showed the organisms in question in the blood with secondary otitis media and mastoid complication (requiring mastoidectomy), the second with positive blood test developed appendicitis (requiring appendectomy) and wound erysipelas, the third showed a positive blood test, necrotic angina, otitis media with mastoiditis (bilateral operation), and finally thrombosis of the transverse sinus which required ligation of the left jugular vein, the case ending in recovery, while in addition there had been several subcutaneous abscesses, the fourth patient showed blood infection, mastoiditis and subcutaneous and joint metastases Of the total 18 patients with sepsis, 11 recovered, this is well worth quoting when some of our standard reference works of recent date make the prognosis almost 100 per cent fatal —*Klinische Wochenschrift,* April 9, 1929

A New Treatment of Post-Encephalitic Conditions —Alwin Fischer refers to recent researches by Beringer on the action of the active principle of the *Liana banisteria caapi* on paralysis agitans and parkinsonism in general. Lewin, who discovered this alkaloid, named it banisterine, while recently Wolfler and Rumpf have found it identical with the active principle of another plant, *Peganum harmala,* which they term harmine The above work is of very recent date, all papers on the subject appearing in 1928 The author was able to obtain a minute amount of harmine, enough for a trial on three patients with post-encephalitic parkinsonism, and exhibited it in doses of 0 02 gm every second day both by mouth and subcutaneously The action was incomplete, that is, it did not cover the entire syndrome, for the tremor and salivation remained unaffected throughout, but the rigidity, voluntary movements, and spontaneity were favorably affected These results agree in the main with those obtained by Beringer with banisterine No ill effects were noted In Case 1 a course of harmine treatment was followed by one of scopolamine, with increasing and diminishing doses, and the patient continued to improve, but whether this last improvement was due to a synergistic action of the two drugs is not yet known In the two other cases no scopolamine was used, and the next effort of the author will be to determine whether there is an advantage in giving the drugs in combination Naturally the pushing of scopolamine or atropine in these patients is attended with some risk The cases were all of long standing, one going back to 1921, so that spontaneous improvement over the short duration of the treatment period is hardly to be thought of —*Münchener medizinische Wochenschrift,* March 15, 1929

Bacillus Abortus Infection in Man —Professor W Frei, the veterinary pathologist of the University of Zürich, reports ten cases of this infection Of the 10 victims 5 were women of whom one suffered from recurrent abortion after exposure to the disease in cows Three others showed a septic condition with positive agglutination tests and possible infection from stables, while a fifth as a laboratory assistant was infected from a culture of Bang's bacillus In this case there was an endometritis with bacillary finds Of the five men infected three were probably exposed to infected cattle in their occupations, while a fourth was a serologist and the fifth a veterinary Not one of the 10 patients could be said to have suffered from Malta fever and certainly in the vast majority of cases of transmission of disease by Bang's bacillus, the writer claims, the two maladies are clinically distinct. The human disease from this organism is nearly always derived from cows with abortus infection and the victims are not infected from drinking the milk. Cases of this sort are seen by veterinarians The great question of the day is whether under exceptional circumstances Bang's bacillus may not in some manner become the starting point for an outbreak of Malta fever in mankind Perhaps infection of the milk alone might be sufficient for this transition —*Schweizerische medizinische Wochenschrift,* March 23, 1929

ened —*British Medical Journal,* April 6, 1929, 1, 3561

Aphorisms of Diphtheria Treatment.—Dr Lammerhirt, a Berlin pediatrist, subdivides his subject matter under three captions, the first being failure of serum treatment He has seen but one clean-cut failure of serum when given early in proper dose This occurred during the war, the patient being a robust young soldier So far as the throat was concerned the membrane began to recede after the second injection of 4,000 units, but death took place from heart failure on the 14th day The first injection which was without any effect was made with a mixture of two different sera, the second with a single serum Since this event he has always employed a single serum Possibly some one will investigate the possibility that a mixture of two different sera which is meant to give the patient a better chance is a technical error The second subject is the type of diphtheria newly sprung into prominence and termed toxic, septic, or malignant, which is said to resist serum treatment The author believes that serum failure in these cases will not occur if the treatment is properly carried out along with certain other measures, such as collargol injections plus vigorous special local treatment as outlined below In reserve he suggests the use of a good antistreptococcus serum There is no objection to give all three forms of injection simultaneously While no figures are given the author seems to have had exceptionally good results from this combined treatment The third subject is the local management which has perhaps been too much neglected since the introduction of serum treatment. For the past 20 years Lammerhirt has employed kaolin, 125 grams to ¼ liter of water, a teaspoonful every 5 minutes The drug should be in finest powder, be shaken well with the water and allowed to stand for a quarter of an hour, then stirred before use The fetor and pain should at once show improvement The principle of cure involved is that of adsorption —*Munchener medizinische Wochenschrift,* March 22, 1929

The Danish Gold Treatment of Pulmonary Tuberculosis—L Bernard and C Mayer give the results of four years experience with this drug The salt of gold employed is the thiosulphate of gold and sodium as first employed by Mollgaard The authors have not found that this is a specific, but there is often remarked a favorable influence on the course of the disease, especially during an exacerbation of the same as shown by the curves of temperature, defervescence coinciding with the action of the drug Statistics which have been accumulating now enable us to form new generalizations Rontgenograms taken some months after a course of treatment have shown improvement and even the apyretic cases may sometimes be influenced favorably Two groups may be distinguished, the acute and febrile and the chronic which were chiefly nonfebrile, the number of patients of the first class being 142 and of the second 29 In regard to the former we must allow for a certain number of cases of spontaneous arrest with defervescence, but this outcome is seen in less than 5 per cent of the total material under observation, while the percent in the series treated with the gold salt was 43 The number of deaths to date in this defervescence series is 17, the patients living from 6 months to 2 years after suspension of treatment, death always resulting from a new exacerbation Of the remainder 15 followed up were apparently free from disease while another series of 30, although not followed up, to date gave every promise of arrest. No figures are given concerning the 80 patients who did not respond to the gold treatment, nor the 29 apyretic cases In discussion Jeanselme mentioned in this connection the favorable results of the gold treatment of erythematous lupus —*Bulletin de l'Académie de Médecine,* March 19, 1929

Tellurium Therapy in Leprosy — Rodolfo Stanziale reports his experience with tellurium in the treatment of five cases of leprosy He has used 10 per cent metallic tellurium in 5 per cent glucose suspension, biniodide of tellurium in 10 per cent oily suspension, and iodine-tellurate of quinine in 5 per cent oily suspension In tubercular leprosy appreciable changes have been obtained in the tubercles and ulcerative forms by the tellurium treatment. There has been noted a flattening of the tubercles and nodules, and a modification in their consistency This sometimes occurs in a few days after beginning the treatment No results were obtained in the only case of macular leprosy treated In none of the cases was there any immediate change in the serological reactions In general, after treatment the blood showed a diminution of the red corpuscles, hemoglobin, and lymphocytes All the patients lost weight, all showed depigmentation of the pilous parts, a pronounced garlic odor, especially of the breath, and bluish pigmentation of the skin, more marked according to the extent of the eruption The treatment produced no harmful effect on the kidneys From the histological examination it seems that the tellurium does not act essentially on the tissue cells of the granuloma There was an evident parasitic action, revealed in the bacteriological examination, which clearly showed a lysis of the Hansen bacilli in the center of the leproma cell and a granular transformation of the surround-

ent The doctor also administered a prophylactic dose of tetanus antitoxin The boy was suffering considerable pain and was unable to move the leg on account of the pain produced by the wound The next day the doctor saw him twice, examined the wound, washed it with chlorazene solution and dressed it with aseptic gauze The following day the doctor called three times He found evidence of cellulitis below the wound and instituted treatment for the same, consisting of local application of saturated solution of magnesium sulphate and streptacoccus vaccine, dressed the wound after removing some devitalized tissue, washed it with chlorazene solution and packed it with sterile gauze The same procedure was repeated on the following day The cellulitis did not appear to run a virulent course On the following day the doctor called again and the same procedure as on the previous day was carried out. At this time the cellulitis appeared to be under control There was a considerable amount of sloughing, some of which was removed and some appeared ready to be removed at a subsequent visit so as not to cause bleeding or to open up avenues of infection The boy's temperature ranged during this time from 99 5 to 102 5 and the pulse varying from 85 to 110 On the occasion of the last call the patient was comfortable and appeared to be more cheerful than on the previous days The doctor had arranged to call again, but before he had an opportunity of doing so the parents of the boy called up and said that they had obtained the services of their family physician and that the doctor's services were no longer required Subsequently the boy was removed to a hospital under the care of his family doctor For about a month while the boy was in the hospital his condition seemed to be improving and the indications were that he would completely recover, but about six weeks after the accident abscesses broke out on different parts of his body with the result that infection and gangrene set in and he died.

An action was then begun by the father of the boy against the defendant doctor in which it was charged that as a result of defendant's negligence the boy came to his death Specific charges of negligence were first, that the doctor made no effort to remove the gun shot in the wound or to explore said wound for the purpose of removing foreign material therefrom, second, that the defendant failed to take any proper steps to prevent the development or arrest the development of poison germs in the wound, third, that the defendant failed to amputate the limb of plaintiff's intestate so that the gangrenous condition thereof should not communicate itself to the rest of the body, when the need for such amputation became apparent, that he attempted to operate upon the wound with filthy and unsterile instruments and in a rough manner

The case came on the calendar to be tried and the issue as to the claimed negligence of the defendant doctor was submitted to the jury, who promptly returned a verdict in favor of the defendant doctor

CELLULITIS—CLAIMED NEGLIGENCE RESULTING IN AMPUTATION

In this case it was charged that the doctor treated a little girl so negligently that her left leg was amputated above the knee Damages were prayed for in the sum of $100,000

When the doctor first saw the child, she was in bed with a temperature of 105, complaining of great pain in the leg, especially the knee The bed and the house generally were filthy The parents gave a history that the child, some two or three days previous to the doctor's first visit, had been coasting on the street, and had received a slight scratch on the instep which had not healed and contained some pus The doctor found a slight swelling of the foot around the ankle, but no redness The doctor requested the parents to send the child to a hospital, since the conditions in the home were unsanitary and were not conducive to proper treatment of the child This request, however, was refused by the parents

For the next three days, the doctor visited the child, but there was no improvement in her condition, and on the fourth visit he told the family that cellulitis had developed, and the leg would have to be opened He requested permission to bring in a consultant, and the consultant upon his arrival refused to treat the child unless the parents consented to remove the child to a hospital After some argument with the parents, the child was finally sent to a hospital, where it finally became necessary because of the spread of infection to amputate the child's leg

The plaintiff's attorney, after repeated attempts to procure a settlement, finally discontinued the action and the case was ended in favor of the doctor

LEGAL

By Lloyd Paul Stryker, Esq
Counsel Medical Society of the State of New York

OBSTETRICS—CLAIMED DELAYED DELIVERY

In this case actions were brought by a husband and his wife against two physicians It was charged that physician A was engaged by the plaintiffs to deliver the plaintiff wife who was then pregnant, of a child and that the said defendant accepted the engagement aforesaid It was further charged that in the first stages of delivery, doctor A told the plaintiffs that owing to unexpected developments he required the assistance of another physician and suggested that doctor B be called in, to which the plaintiff husband acquiesced The complaint then charged that upon arrival of doctor B, neither of the defendants would deliver the child unless the plaintiff husband paid a sum of money in excess of that which he had originally agreed to pay doctor A The complaint further charged that the plaintiff husband, in order to obtain action immediately on the part of the defendants, delivered to them a check for the amount which they asked and thereupon and not till then did the defendants commence work upon the plaintiff wife By reason of the aforesaid and the further fact that the delivery was done in a negligent and careless manner, it was claimed that the plaintiff wife was badly mutilated and torn, became dangerously infected and poisoned and that the child was born dead

From the facts it appeared that doctor A had delivered this woman of two children, one dead and one living, prior to the delivery which formed the subject-matter of this case He saw the woman at his office about twice a month for four months prior to the delivery On the day that the woman was in labor he was called to her home, and realizing that the delivery was going to be an extremely difficult one, he suggested that a specialist be called in The husband and wife consented to this and doctor B was called in When doctor B arrived, he found the woman in active labor for some time without progress, the os was fully dilated, fetal sounds were not present and doctor B immediately notified the husband that the baby was dead, and also told him that the delivery would necessarily be a breech delivery The woman was placed under a general anaesthesia by doctor A, and doctor B, after sterilizing his instruments, proceeded to draw out the feet by hand manipulation, then the trunk and afterwards the arms

It was necessary at this point, in order to withdraw the head, to use forceps and in this manner the child was withdrawn The child was dead It was an abnormally large child with the skin peeled off the body in several places, indicating that the child was dead long before delivery There was a slight tear in the perineum of the mother which doctor B sutured with catgut and he also washed the parts with lysol solution and the patient was returned to bed Doctor B called daily to see the woman for a period of three weeks when she had fully recovered There was no discussion between the doctors and the husband or wife concerning the fee to be paid to either physician and there was no delay in the delivery After doctor B had finished his work the husband asked him what his charges were and doctor B charged a very reasonable fee, which the husband paid immediately, expressing appreciation for what was done At no time did either the husband or wife express to either doctor any dissatisfaction of the treatment rendered

When the case appeared upon the calendar and was about to be reached for trial, the plaintiffs failed to appear and the case was dismissed.

GUN SHOT WOUND—CLAIMED NEGLIGENCE RESULTING IN DEATH

The patient, a young man, was brought to the doctor's office with a history of a gun shot wound in the right thigh The doctor removed the part of the clothing necessary to inspect the wound which was located in the upper part of the patient's right thigh in the outer aspect and was over an inch in diameter with irregular and rough appearance, about half an inch deep with smaller gun shot wounds around it The defendant found evidence of a limited amount of bleeding He removed from the wound all the loose flesh, skin and foreign material that was present and that could be reached without disturbing the deeper structure, applied iodine and dressed the wound with aseptic gauze and bandaged the leg He examined the leg by manipulation and ascertained that the bone had not been injured The young man refused to go to a hospital and was removed to his home where the doctor saw him three times the same day, the first time redressing the wound, the second time making a general examination to see if any other injury was pres-

profession involving professional treatment of certain classes of people. They have presented in their report for your consideration a proposed list of charges for professional service which are about one-third higher than has been paid on the average. This was formulated for your consideration at the request of the County Judges and Children's Court Judges where children's court judges exist and at the request of the State Department of Health concerned in certain details of administration and at the requests of the Department of Education which is charged with the duty of executing the law The conferences of interested agencies have resulted in certain tentative conclusions but the adjustments of relationships are not complete and may require continuous supervision by organized medicine in order to protect the economic interests of the medical profession The Committee, therefore, requests the appointment of itself as an advisory committee to the Public Health Committee.

Referred to the Reference Committee on the Report of the Committee on Public Relations (Action in Sec. 23)

5 Birth Control—Kings County Resolutions

Dr Luther F Warren, of Kings The following resolution was adopted at the regular meeting of the Medical Society of the County of Kings, in March

Resolved, That the Medical Society of the State of New York, in meeting assembled, declares its opposition to the introduction or enactment of any law that will change the policy of the State of New York in the matter of birth control or sterilization or so amplify the police power of the State as to threaten the money or man-power of the State, or its physical, moral or economic security, or the safety of its citizens or to disturb the safeguards thrown about the practice of medicine in the State of New York as contained in the Medical Practice Act

Referred to Reference Committee on New Business A (Report Sec. 31)

6 Dues of Incapacitated Physicians

Dr Thomas C Chalmers, of Queens I have a resolution from the Medical Society of the County of Queens to present to the House

Whereas, certain practicing physicians in the State have developed diseases which make it essential for them to give up their practice for a time, and whereas, this causes, in the majority of instances, their income to cease and works hardship upon them

Therefore, be it resolved that the State dues of any member shall be suspended by the Medical Society of the State of New York during the time that a member is absent for his health, provided that his County Society makes application for such remission or suspension of dues, accompanied by a statement that the County Society has so suspended his County dues

Referred to Reference Committee on New Business B (Report Secs., 9, 33 37)

7 Committee on Physical Therapy

Dr DeWitt Stetten, of New York presented the following resolution —

Whereas the problems of the physiotherapy situation are state-wide, and call for the awakening and education of the entire medical profession of the State

Be It Resolved that the Medical Society of the State of New York form a State Committee on Physical Therapy of seven to be appointed by the President.

Be It Further Resolved that this State Committee shall function in cooperation with physical therapy committee to be created, if possible, in all County Societies, each of the committees to have at least one physician who has received ample post-graduate instruction in this field of therapeutics, and,

Be It Further Resolved that this State Committee should also cooperate with the Committee on Public Health and Medical Education inasmuch as the ultimate solution of the problem lies in the proper evaluation and practical application of physical therapy by the physicians themselves

Referred to Reference Committee on New Business C.

Dr George W Kosmak, of New York Your Reference Committee on New Business C has considered the resolution presented by Dr DeWitt Stetten of New York and reports as follows

Your Committee approves of the resolution presented by Dr Stetten and recommends that it be referred to the Council of the State Society for further consideration and action I move its adoption

Motion seconded and carried

8. Sewage Disposal — Resolutions of Dutchess — Putnam

Dr C Knight Deyo, of Dutchess—Putnam The Dutchess—Putnam Medical Society has the following resolution to present

Whereas, The Hudson River and its main tributary the Mohawk River, has for many years been a common sewer for the cities and villages along its banks, thereby causing these same bodies of water to be polluted to an extreme degree, and

Whereas, These same bodies of water furnish a source of fresh water supply which is inexhaustible and not affected by droughts or diminished rainfall, and

Whereas, Almost all the cities and villages along these streams are compelled to obtain their water supply from upland sources or resort to expensive purification systems to care for these polluted waters, and

Whereas, It has been known that for at least fifteen years past the State Department of Health has refused permission for any increase in the number of trunk line sewers to be emptied into the Hudson River, and

Whereas, The so-called upland supplies are also contaminated to a greater or less extent, requiring filtration, purification and chlorination before becoming safe for drinking purposes

Therefore Be it Resolved, that it is the sense of the Dutchess—Putnam Medical Society that the state government through its Department of Health should institute measures looking toward the elimination of sewage disposal into the main waterways of the state,

Be It Further Resolved, that the Dutchess—Putnam Medical Society insist that the pollution of the Hudson and Mohawk Rivers is unnecessary and inimical to the public health of the citizens adjacent thereto,

Be It Further Resolved, that the Dutchess—Putnam Medical Society petition the House of Delegates of the Medical Society of the State of New York to approve the aforesaid resolutions and invest its President with power to appoint a committee whose duty it shall be to confer with the proper state officials and in all ways endeavor to get such action as will lead to an elimination of the pollution of waterways of the state.

Referred to Reference Committee C on New Business (Report in Sec. 19)

9 Dues of Incapacitated Physicians (Secs 6, 9, 33)

Dr Terry M Townsend, of New York The Committee on New Business B has the honor to report unfavorably on the resolution introduced by Dr Chalmers suspending the dues of the Medical Society of the State of New York of members of County Societies It is the opinion of your committee that County Societies should bear the dues of all their members until they are retired from membership I move its adoption

Motion seconded

Dr Chalmers, of Queens I consider this resolution, one of simple justice. It seems to me that when a man who has been a practicing physician for a number of years acquires a disease which takes away his livlihood, the Medical Society of the State of New York can afford to do what his County Society has done, and the moment he comes back those dues should be taken up I do not believe that this committee understand, or

HOUSE OF DELEGATES

MINUTES OF ANNUAL MEETING

The Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Utica, on Monday afternoon, June 3rd, 1929 Speaker, Dr John A Card, Secretary, Dr Daniel S Dougherty

1 Committee on Credentials

The Speaker The first order of business is the report of the Committee on Credentials, Dr Dougherty

The Secretary Mr Speaker and Gentlemen, the Committee on Credentials has the pleasure of reporting that there is no duty for it to perform, as there are no disputed delegations

The Speaker announced that the Secretary would call the roll by counties for the purpose of determining the presence of recognized delegates

The Secretary called the roll and, a quorum being present, the Speaker declared the House organized for business

2 Reference Committees

The Speaker Mr Secretary, please read the Reference Committees as appointed by the Speaker

The Secretary read the following reference committees

Reference Committee on the Report of the President Floyd S Winslow, Rochester, Chairman, George A Leitner, Piermont, Edward M Colie, Jr., New York City, Charles R Borzilleri, Buffalo, Aden C Gates, Kingston.

Reference Committee on the Reports of the Secretary and the Council Harry S Patterson, New York City, Chairman, Luther C Payne, Liberty, Edwin A Griffin, Brooklyn, Augustus J Hambrook, Troy, Edward C Podvin, Bronx

Reference Committee on the Reports of the Treasurer and Trustees George M Cady, Nichols, Chairman, Morris Maslon, Glens Falls, George B Stanwix, Yonkers, Charles D Squires, Binghamton, Charles C. Trembley, Saranac Lake

Reference Committee on the Report of the Committee on Legislation Walter T Dannreuther, New York City Chairman, Frederick J Schnell, North Tonawanda, W Grant Cooper, Ogdensburg, Lucius H Smith, Palmyra, M Jean Wilson, Warsaw

Reference Committee on the Report of the Committee on Scientific Work and the Committee on Arrangements Thomas W Jenkins, Albany, Chairman, Seth N Thomas, Auburn, Norman S Cooper, Athens, Edwin H Fiske, Brooklyn, Joseph B Hulett, Middletown

Reference Committee on the Report of the Committee on Public Health and Medical Education Reeve B Howland, Elmira Chairman, Henry J Noerling, Valatie, Norman L. Hawkins, Watertown, George L. Manley, Norwich, Leo F Schiff, Plattsburg

Reference Committee on the Report of the Committee on Medical Economics, Frederick H Flaherty, Syracuse, Chairman, Thomas M Brennan, Brooklyn, DeWitt Stetten, New York City, Herbert B Smith, Corning, M A Rogers, Greenwich

Reference Committee on the Reports of the Committee on Public Relations and Councillors George M Fisher, Utica, Chairman, George Cottis, Jamestown, Aaron Sobel, Poughkeepsie, J Lewis Amster, Bronx, George S Towne, Saratoga Springs

Reference Committee on the Report of the Legal Counsel C Knight Deyo, Poughkeepsie, Chairman, Francis H Marx, Oneonta, Carl Boettiger, Astoria, Dudley R Kathan, Schenectady, Harrison Betts, Yonkers

Reference Committee on New Business—A John Douglas, New York City, Chairman, Andrew Sloan, Utica, George E. Welker, Dresden, John D Bonnar, Buffalo, Sylvester C. Clemans, Gloversville.

Reference Committee on New Business—B Terry M Townsend, New York City, Chairman, William A. Krieger, Poughkeepsie, Charles L. Davis, Batavia, John E. Jennings, Brooklyn, Charles R. Barber, Rochester

Reference Committee on New Business—C George W Kosmak, New York City, Chairman, Henry C. Courten, Richmond Hill, Albert W Ferris, Watkins Glen, William P Howard, Albany, Lyman C Lewis, Belmont.

Reference Committee on Credentials Daniel S Dougherty, Peter Irving, Walter D Ludlum.

Reference Committee on the Reports of the Committee on Nursing and the Committee to Study the Curriculum for Nursing Education Alec N Thomson, Brooklyn, Chairman, Claude C. Lytle, Geneva, Henry R. Bentley, Central Bridge, Frank S Child, Port Jefferson, James Walsh, Cortland

Reference Committee on the Report of the Committee on Immunization of Children Against Diphtheria Harry Aranow, Bronx, Chairman, John L. Crofts, Newport, Harvey S Albertson, Oswego, Luzerne Coville, Ithaca, Milton C Potter, Buffalo

Reference Committee on the Report of the Committee on Medical Research Thomas P Farmer, Syracuse, Chairman, John Breen, Schroon Lake, Gustave A. Fensterer, Garden City, Leif G Jensen, Port Richmond, Harvey W Humphrey, Lowville, Frederick J Bowen, Mount Morris

3 Approval of Minutes

The Secretary moved that the reading of the minutes of the previous meeting be dispensed with. Seconded and carried

The Secretary moved that the reports of the President, Officers and Committees be referred to their respective reference committees as printed The motion was seconded and carried.

The Speaker Are there any supplementary reports from committees or any resolutions to be presented?

4 Public Relations Committee Supplementary Report

Dr William H Ross, of Suffolk The Public Relations Committee has a supplementary report to present

To the House of Delegates The Public Relations Committee requests the House of Delegates to appoint the Public Relations Committee of the State Society as it may be constituted next year, as a special advisory committee to work with the Departments of Education and Health regarding the administration of the laws relating to the professional treatment and compensation for professional treatment of the rehabilitation of crippled children of the State as outlined in Article 47 of the education law The reason for this is that there are many details relating to the administration of the law requiring the State to undertake the rehabilitation of crippled children that concern the medical profession. Various circumstances give evidence that the details of administration have not always been in accordance with professional standards and ideals

The Public Relations Committee has given a great deal of time and thought to the problems growing out of the relation of the laws of the State to the Medical

tions to make it possible for physicians or surgeons to accept fees from official or voluntary health agencies for professional services rendered indigent persons coming under the care of those agencies, and it recommends that this be undertaken through the office of the Secretary of the Medical Society of the State of New York

I move its adoption.

Motion seconded, put to a vote and carried

17 CERTIFICATION OF SPECIALISTS

Dr Winslow The committee recommends that the Medical Society of the State of New York memorialize the Regent of the University of the State of New York with a view to establishing some method for the legal certification of competent specialists

I move its adoption.

Motion seconded and carried

18 FEES FOR POST GRADUATE COURSES

Dr Winslow With a view to making post-graduate courses self-supporting, the committee recommends that a nominal fee of $1 00 per capita per course be collected from those attending this course. This money to go to the Treasurer of the Medical Society of the State of New York to be credited to this fund

I move its adoption.

Motion seconded, put to a vote and carried.

Dr Winslow I move the adoption of the report of the Reference Committee on the report of the President as a whole.

Motion seconded and carried (Report Sec. 32)

19 SEWAGE DISPOSAL RESOLUTIONS OF DUTCHESS-PUTNAM (Sec. 8)

Dr Kosmak I have a report from Committee on New Business C.

Your Committee on New Business C has considered the resolutions endorsed by Dr Deyo, of Dutchess-Putnam, (Sec. 8) and approves the recommendations contained therein, including the appointment of a Special Conference Committee by the President of the State Society

I move that these resolutions be adopted

Seconded and carried

20 COMMITTEE ON PUBLIC RELATIONS (JOURNAL, MAY 1, PAGE 523)

Dr George M Fisher, of Utica, presented the following report of the Reference Committee on the Reports of the Committee on Public Relations and Council.

1 The Members of the Committee on Public Relations have studied with a great deal of interest the report made by the Chairman of the Committee on Public Relations and fully appreciate the value of its work, and are likewise conscious of the many difficulties with which it has had to contend during the past year

2 We indorse the efforts made by the Committee in bringing its work to the attention of the Public Relations Committees of the several counties and that its efforts are bearing fruit is evidenced by the reports which have been received

3 The method of the Committee in dividing the State into several units we consider an advanced step and will aid in bringing to a more satisfactory termination the results desired, as well as coordinating the local Public Relations Committees and the several lay agencies The questionnaire to the local Public Relations Committees will aid the Committees and give more concise results

4 We agree with the Public Relations Committee in that the Chairman of each unit throughout the State should be represented by a physician well versed in civic affairs and well acquainted with the methods pursued by their local lay organizations.

5 The eight principles which were adopted by the House of Delegates one year ago, we consider should be the foundation of the work of the Committee as applied to the Medical Profession. Too great stress cannot be laid upon their value in the relationship between the Medical Profession and public lay organizations and each County Society should have them fully in mind when consulting or advising with their respective lay bodies

6 We agree with your Committee that the five functions promulgated by the Public Relations Committee one year ago should be followed by each County Medical Society

7 We consider that the Committee should be congratulated on the work accomplished during the last year in several of the county units, and we will expect a decided and favorable report from all the counties during the coming year

8 The Committee and the State Society should be highly gratified by the results of the conference of the Committee in connection with the State Committee on Care of Crippled Children. This, we consider an advance step—placing the Medical Profession where it rightfully belongs in caring for children who are under State supervision. The same procedure might well be applied to other public and charitable institutions

9 While the Medical Profession is perfectly willing to perform its charitable duties when charity is necessary, still, on the other hand, we consider that every man is worthy of his hire, and it is the duty of the State, and all charitable institutions, where possible, to recompense the attending surgeon or outside consultant to an extent in proportion to the funds available.

10 Your Committee does not consider it advisable for the House of Delegates to establish a set of fees for Charitable Institutions or others, which would apply to the entire State.

Dr Fisher I move adoption of paragraphs one to ten. Motion seconded and carried

21 FEE LIST FOR OPERATIONS ON CRIPPLED CHILDREN

Dr Fisher 11 We recommend as a minimum basis for the guidance of judges in the various counties in passing upon the allowances to orthopedic surgeons the set of fees as arranged between the State Committee on Care of Crippled Children and the Public Relations Committee. This does not make it binding by any regulation of the House of Delegates, but rather a gentleman's agreement between two Committees, thereby relieving the State Society from the danger of censure by any of its members on the grounds of fee regulation.

It is understood that minimum fees for post-operative care shall be in conformity with the minimum fee customarily charged in the locality for similar services.

Dr James F Rooney, of Albany On this question of fees we should make it definitely understood it is a non-official recommendation. A minimum fee bill tends to become a maximum fee bill always, and in this question of a fee schedule we should go slowly, certainly cautiously, and I believe in the beginning definitely unofficially I hope that you will consider this matter very seriously before giving any official approval by this house to a fee bill of any nature whatsoever

Dr Harvey S Albertson, of Oswego I wish to endorse what the last speaker stated I feel that opening the door to this proposition now may mean a wide open door at a later period.

Dr James E Sadlier of Dutchess-Putnam Your Committee on Public Relations took this matter up and it was taken up by two state departments We are dealing now not with a prospective thing, not with prospective legislation, but we are dealing with a law which actually exists in this State, which gives to these two state departments the control of and demands that they shall take care of the indigent crippled children. Your Committee on Public Relations gave this very careful consideration and first promulgated a certain set of resolutions which are printed on page 22 of the annual report. This fee list was agreed upon and is about

I cannot conceive that a resolution of this kind could be reported unfavorably with the amount of funds in the Society's treasury

Dr Townsend of New York your committee has given due thought and ample consideration to all the points which Dr Chalmers has presented We feel that this is an entering wedge toward lowering the dues of the Society

Dr Ernest E Smith, of Queens it seems to me it is a reflection upon an organization of this kind to demand payment of dues from men entitled to our consideration on account of their affliction, and I want to voice the sentiments of the County of Queens, supplementing what Dr Chalmers has said, and express the hope the Society will act according to the recommendations and disapprove the recommendations of the Reference Committee

The Secretary Mr Speaker, this question came before the Executive Committee and the Executive Committee were unanimously in favor of such action It was referred to the legal counsel and your secretary, who felt that the Executive Committee did not have the power to remit the dues nor to pass any resolution remitting dues, and so advised Queens County to refer it to the House of Delegates We are doing a brotherly act and I absolutely believe we could do nothing more to show we were a society banded together for mutual welfare than in helping doctors when they are down and out for reasons outside of their own physical actions We did not consider that it in any way affected the general dues

Dr Edward M Cole, of New York I move that this be re-referred to the committee

Motion seconded, put to a vote and carried

10 COMMITTEE ON LEGISLATION (JOURNAL, MAY 1, PAGE 522)

Dr Walter T Dannreuther, of New York Your Reference Committee on the Report of the Committee on Legislation notes with approval the activities of this committee, and the cooperative work of the Executive Officer, particularly in advising the legislators wisely, and in opposing vicious legislation It is unfortunate that the Chairman of the County Committees could not have been furnished with copies of the bills, for unless the members of these committees are thoroughly familiar with the details of at least the important bills, a sustained interest and vigorous activity on their part can hardly be expected As a matter of fact, if each County Society subscribed annually to the Legislative Index Company, the local chairmen would receive copies of the bills without imposing upon the facilities and resources of the Legislative Committee of the State Society

We recommend that the office of the State Legislative Committee be provided with sufficient clerical help to insure copies of the bills being sent to each County Society Chairman

I move the adoption of the report

The Secretary Mr Speaker, that carriers with it an appropriation for clerical help, and so has to come before the Council

Dr Dannreuther Then I would amend it to read that this be referred to the Council

The motion as amended was seconded, put to a vote and carried

11 COMMITTEES ON SCIENTIFIC WORK AND ARRANGEMENTS

Dr Thomas W Jenkins, of Albany The Report of Reference Committee on Reports of Committees on Scientific Work and Arrangements

On scientific work (Journal, May 1st, page 531) we can only commend the zeal and activity that they have shown in arranging such a valuable program, and inviting eminent men from our own and other States to participate in the reading and discussion of the papers

We note with pleasure that all readers of papers, and those scheduled for participation and discussion, are for the first time members in their component County and State Societies where they are eligible for membership

The Committee wishes to commend the innovation of calling a general meeting at which leaders of American Medicine and Surgery will open a discussion on three subjects from which the Committee on Scientific Work feel that a broader understanding of medicine and surgery will be obtained and much good will be accomplished.

We also note that there is no program arranged for the section devoted to industrial medicine. We feel that members of the State Society would profit well by taking advantage of the Thursday program arranged by the Scientific Committee

Your committee commends the committee on arrangement (Journal June 1, page 701) for the care in providing suitable hotel accommodations, and space for exhibits and the entertaining of visiting ladies and other guests

A recent arrangement is that the Tuesday evening session will be semi-public, semi-social in character

I move the adoption of the report.

Motion seconded.

The Secretary I move to amend the motion, that the portion of the report referring to the section on Industrial Medicine be referred to the Council

Motion on the amendment was seconded, put to a vote and carried

The motion on accepting the report was put to a vote and carried

12 APPRECIATION OF EX-SPEAKER DR. E. ELIOT HARRIS

The Secretary then read a telegram from the speaker, Emeritus Dr E. Eliot Harris

Dr Kalish moved that the secretary be instructed to answer the telegram and express to Dr Harris the felicitations of the House and its good wishes Motion seconded and unanimously carried

13 COMMITTEE ON PRESIDENT'S REPORT (JOURNAL, MAY 1, PAGE 505)

Dr Floyd S Winslow, of Monroe The Committee on the Report of the President reports as follows

In considering the report of the retiring president, this committee on behalf of the Medical Society of the State of New York, expresses its appreciation of the faithful service rendered to this society during the past year, and we especially commend the president for the constructive suggestions looking toward the further extension of the activities of the Society

14 CONFERENCE OF COUNTY SECRETARIES

Dr Winslow The committee further recommends The establishment of an annual conference of the Secretaries of the County Societies

I move its adoption

Motion seconded, put to a vote and carried

15 TRI-STATE CONFERENCE

Dr Winslow The committee recommends that the Budget Committee includes an item to cover reasonable expenses of the Tri-State Conferences

I move its adoption

Seconded

Dr Philips called attention to the fact that the resolution required an appropriation of money

Dr Winslow Then I will amend the recommendation to refer it to the Council.

Motion seconded and carried

16 PHYSICIANS FOR INDIGENT CASES IN HOSPITALS

Dr Winslow The committee recommends that the Medical Society of the State of New York suggests to the hospitals of the state that they modify their regula-

28 Periodic Health Examination and Health Week

Dr Aranow presented the following resolution

Resolved, That a special committee be appointed by the President whose duty it shall be to popularize periodic health examinations, and that a week be set apart to be known as "Health Week" to initiate this campaign.

Referred to Reference Committee on New Business B (Report Sec. 36)

29 Cost of Medical Care

Dr Aranow presented the following resolution

Whereas, great publicity has been given to the alleged "high cost" of medical care, and

Whereas, the amount actually paid for medical services constitutes but a very small percentage of the total

Be it Resolved, that a committee be appointed to emphasize this fact and bring it to public attention.

Referred to Reference Committee on New Business B (Report, Secs 38 and 49)

30 Report of Secretary (Journal May 1, page 507)

Dr Henry S Patterson, of New York I wish to submit the report of the Reference Committee on the Report of the Secretary

Your reference committee heartily endorses the report of the secretary as a whole and congratulates the Society on his painstaking, efficient and complete communication. Your reference committee wishes to emphasize the following features of the secretary's report

1 That it is the duty of each standing committee to furnish the secretary with notices of its meetings, and with reports of all such meetings.

2. This reference committee heartily endorses the secretary's suggestion that the Committee on Public Health and Medical Education be relieved of undue burdens and that such relief be afforded by establishing a standing committee on Public Health

3 That the reference committee endorses the suggestion that the work of the Committee on Medical Economics be broadened so as to include all phases of Medical Economics

4 Your reference committee endorses the recommendation that the executive officer be made field secretary to the Committee on Public Relations

Dr Patterson I move the adoption of the report

Motion duly seconded and carried.

31 Birth Control, Kings County Resolutions (Sec. 5)

Dr John Douglas, of New York Reference Committee on New Business A has carefully considered the resolution introduced by Kings County, and believes there are two different problems introduced in this one resolution—(1) Affecting contraceptive advice (2) Affecting sterilization It believes that these two subjects should not be covered by one resolution, and does not recommend the passing of this resolution in the form introduced because it covers two subjects, and also because it is ambiguously worded.

The committee recommeends that the resolution be referred to the Council for further study

I move that this report be accepted and the recommendation adopted.

Motion seconded and carried

On motion duly made, seconded and carried, the House adjourned to meet at eight o'clock P M

Evening Session

Monday, June 3rd, 1929, 8 00 P M

The Meeting was called to order by the Speaker

The Speaker Is there anything to offer under the head of New Business, or reports of business?

32. Fees for Post Graduate Courses (Sec. 18)

Dr Winslow, of Monroe Mr Speaker, at the afternoon session of the House of Delegates under the report of the Committee on the Report of the President, the resolution was adopted that, with a view to making post graduate courses self supporting, the committee recommends that a nominal fee of one dollar per capita per course be collected from those attending, the money to go to the Treasurer of the Medical Society of the State of New York, to be credited to this fund.

Following the afternoon session there has been considerable sentiment expressed that it was unwise to carry out this resolution, and therefore, as the chairman of the committee presenting the resolution, and one who voted for it, I move for a reconsideration of this question

Motion was seconded and carried.

The Speaker The question is before you for reconsideration

Dr Morris, of Monroe It has been my pleasure for two years to be chairman of Post Graduate Courses given in Monroe County, and I believe there is no better way in which the State Society can serve physicians in the small communities than through these post graduate courses The Medical Society of the State of New York is not a defunct organization financially The charge of one dollar to these men is a mere bagatelle, but it is going to be difficult to levy this fee or charge it. In view of the fact that the financial record of last year shows we still have a balance of $15,688, it seems advisable that this be reconsidered and that we continue to give these courses free of charge to the medical profession I would be glad to have Dr Farmer say a word on this matter

Dr Farmer, of Onondaga Some of you remember in my report a year ago we took up that question and suggested three possible ways that the course might not be too burdensome for the State Society One was the acceptance of funds from some organization for this work, which I do not believe would be satisfactory for many reasons, another was the levying of a registration fee, and it was our opinion that should be deferred, and I am still of that opinion, the third possibility the stimulation on the part of certain county societies, such as the societies in the larger counties, to offer courses themselves, which they could put on without much expense and which might attract the county society Our experience with the courses so far is that a group of doctors are attracted to these meetings who never go to any other medical meetings

I think the one big advantage is the fact that these men appreciate the work of the State Society, and we are selling the State Society to those men. I am afraid if we put a fee on it at this time we will hurt our work in just that respect, and I am afraid those men will discontinue going Not because they mind the dollar so much but it would just react on them that way In my judgment it would be well to wait at least a year or two before taking the matter of presenting a fee.

Dr Heid of New York The finances of your society are in excellent condition. It should be far from the purpose of this House of Delegates to impose a tax upon its members, in their desire or zeal for medical information That is a duty of this society I would move you that this report be accepted with the deletion of Article E, which makes the tax obligatory

The motion was duly seconded.

Dr Van Etten, of the Bronx As Chairman of the Board of Trustees I would like to add the weight of my opinion to the opinion just expressed by the treasurer, that it is entirely unnecessary Therefore I heartily endorse the motion of the treasurer that this tax be not levied.

The motion that the report be adopted with the deletion of Section E was put to House and carried.

33 Dues of Incapacitated Physicians. (Sec 6, 9, 37)

Dr Chalmers I would like permission, sir, to add one

thirty per cent higher than the one now being operated under in the State of Ohio Your committee can only deliberate, it can not act. It is for you to act on this, but your committee felt that in conferring with these departments and deliberating, establishing this minimum and recognizing it is a minimum fee basis, that we were doing something that was going to be of great benefit to the future citizens of this State and at the same time of great economic advantage to the physicians of the State.

Dr Luzerne Conlle, of Tompkins The chairman of your committee has spoken here time and again recommending a minimum fee bill Nothing here is stated as such, and I amend that report to insert in front of "fee" the word "minimum"—minimum fee bill It now says the "following fee bill" I propose to make it "following minimum fee bill"

Motion was duly seconded

Mr Rooney I have listened very attentively and I must state I am not yet convinced there has been any statement made which justifies our accepting the fee bill I again wish to call your attention to the fact that this is a matter of immediate and pressing importance

The Speaker The language of the paragraph I think takes care of the amendment suggested. Are you ready for the question?

On motion the adoption of paragraph eleven was put to a vote The Assistant Secretary announced fifty-four in favor and sixty-three against. The Speaker announced that paragraph eleven of the report was not approved

21 Fee List for Other Operations

Dr Fisher 12 We are also of the opinion that arrangements similar to this could be brought about between other Public Institutions and the Medical Profession, and further suggest that the Public Relations Committee take this into consideration during the coming year I move the adoption of this paragraph

Motion seconded Upon being put to a vote, the resolution was lost

22 Contact With Health Organizations

Dr Fisher 13 We would further recommend that in its future work, the Committee on Public Relations establish contacts with Public Relations Committees of County Societies and State-wide governmental voluntary organizations to aid the future proper coordination between the Medical Profession and Public Health Agencies

I move the adoption of this paragraph

Motion seconded and carried

23 Committee on Public Relations Advisory to State Departments of Health and Education (Sec. 4)

Dr Fisher 14 Your Committee further endorses the supplementary report of the Chairman of the Public Relations Committee and recommends that the Public Relations Committee be authorized and requested to serve as a special advisory committee to work with the State Departments of Education and of Health regard ng the administration of the laws relating to the professional treatment and compensation for professional treatment of crippled children as outlined in Article 47 of the educational law

I move the adoption of the report.

Motion seconded and carried.

Dr Fisher I move the adoption of the report of the Committee on Public Relations as a whole, except the paragraphs which have been stricken out by the House

Motion seconded, put to a vote and carried

24 The Council Executive Committee and Committee on Publication (Journal May 1, page 512)

Dr Fisher I have a further report to present. Your Committee commends the work of the Council and its various sub-divisions, namely the Executive Committee and the Committee on Publication as given in their report.

1 We are in accord with the Executive Committee that it is the opinion of the House of Delegates of the Medical Society of the State of New York, that medical publicity is that which is educational and deals with the Medical Profession in its entirety, whereas medical advertising appertains to the medical publicity which deals with the individual and may be used to his or her personal advantage.

2 The members of the Medical Society of the State of New York have every reason to be congratulated on their Journal which is by long odds the best State Medical Journal published, and the methods pursued by its Editor-in-Chief and the Executive Editor are of the highest medical literary standing

3 We recommend the continuation of its news department and would suggest that further efforts be made in recording the activities of all component County Medical Societies throughout the State.

4 The articles appearing in its Scientific Department have been of high grade, showing a careful selection to conform to the practical needs of the general practitioners

5 The advertising department has been well patronized and the character of the advertising has been entirely ethical and we further commend their methods of carefully editing all advertising copy

I move the adoption of this report.

The motion was second, put to a vote and carried

25 Committee on Immunization Against Diphtheria (Jounal June 1, page 698)

Dr Harry Aranow, of the Bronx Reference Committee on the Report of the Committee on Immunization of Children against Diphtheria.

Your committee strongly commends and endorses the continued support of the anti-diphtheria work of the Medical Society of the State of New York, and its component County Societies

Your committee also wishes to express its appreciation of the cooperation of the Commissioner of Health of the State of New York and the efficient service of the New York State Laboratories also the enthusiastic work of the Commissioner of Health of New York City

Your committee believes in the importance and wisdom of stressing the post immunization Schicking by a competent physician as a further factor of safety

We further urge the continuation of the intensive campaign of education both through the medical profession and the laity

I move the adoption of the report. Seconded and carried

26 Choice of Physician for Injured Workman

Dr Aranow presented the following resolution Resolved that the House of Delegates of the Medical Society of the State of New York, urge the passage of an amendment to the Compensation Act empowering the injured employee to choose his own physician.

Referred to Reference Committee on New Business C. (Report, Sec. 46)

27 A Physician on the State Industrial Commission

Dr Aranow presented the following resolution

Resolved, That the House of Delegates of the Medical Society of the State of New York, continue to urge the passage of a bill amending the Compensation Act so as to provide for the appointment of a physician on the State Industrial Committee.

Referred to Reference Committee on New Business C. (Report, Sec 45)

year you are going to lose time and that the time to start publicity is right now The very resolution can be put in all the papers, to bring out the fact that medical service cost is only a small fraction of the medical expense, and I personally feel that some way ought to be invented to start the campaign right now

Dr Farmer, of Onondaga I think it is a spendid thing, and agree with Dr Aranow, but I still think it belongs to the Committee on Economics, and I think you are taking away from that committee one of its objects

Dr Heyd, of New York Any one who has reflected on the progress of medical practice in the last few years must have been struck with the fact that medicine is losing its prestige largely because the control of medical matters is passing into the hands of lay organizations The doctor has to bear the odium of all the cost connected with sickness, and we should avail ourselves of every legitimate means of showing to the public that the amount of money paid to a doctor in illness is but a small proportion of the total expense. It is unwise to defer this matter for a year until we meet again. I would suggest a substitute motion—that the President be empowered to appoint a special committee to consider this particular problem and report to the Council of the Medical Society for the purposes of giving that information to the public.

The substitute motion was seconded, put to a vote and carried

The Speaker The report of this committee is the substitute motion that has just been carried

39 COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION (JOURNAL, MAY 1, PAGE 526)

Dr Howland, of Chemung The Reference Committee on the Reports of the Committee on Public Health and Medical Education heartily approves the work of this committee and urge the following recommendations

First, a continuation of the post-graduate lectures and clinics

Second, Wherever possible adjacent counties arrange joint meetings in post-graduate lectures and clinics This will increase attendance and interest and will facilitate work and lessen expense.

Third, Each society participating in the lectures, should share a part of its expense. Each county to have a special committee to care for this work and aid the State Committee.

Fourth, Where several men lecture on the same topic there should be a general uniformity in the character of their lectures, along the lines of the usual recognized practices in their particular field.

Fifth, The State Society to still appropriate $8,000 annually until such time as the individual county societies may share in their expense.

Sixth, The House of Delegates will authorize the committee on post-graduate lectures to urge the various county societies to follow the series of lectures as selected by the State Committee, particularly in the field of physical therapy

I move that those recommendations be adopted.

The Speaker I will accept your motion with the exception of being compelled constitutionally to delete the appropriation of $8,000, which must be referred to the trustees I will accept the report with the deletion.

Dr Houland I accept the deletion, and move that report be accepted as amended. Motion seconded

Dr Rooney I move that this section be amended to read as follows

That it be recommended to the Council that it appropriates a sum of money specified by the Chairman of the Reference Committee for the purpose of continuance of the post-graduate work of the Committee on Public Health and Medical Education.

The Secretary Mr Speaker these are almost unnecessary motions because the Budget Committee communicates with the chairman of each committee and asks him how much he thinks he will need Then we recommend it to the trustees for enlargement, for cutting down, or for voting the exact sum

The motion was put to a vote and carried

40 COMMITTEE ON NURSING (Journal June 1, page 694)

Dr Thomson, of Kings Report of Reference Committee on the Reports of the Committee on Nursing and the Committee to Study the Curriculum for Nursing Education

Your Reference Committee considering the reports of the Committee on Nursing and the Committee to study the curriculum for nursing education, believes this committee should be commended for its work during the past year, particularly in the compiling of data for future consideration, and we suggest to the Society the continuation of the committee on nursing and nursing education with particular thought to the need for careful revision of the curriculum requirements

We concur in the recommendation that the Medical Society of the State of New York go on record as favoring a standard of admission to schools of nursing which shall be the equivalent of a minimum of four years of high school

I move the adoption of this recommendation

The motion was duly seconded.

Dr Bedell, of Albany Mr Speaker, I do not believe that this Society seriously wishes to keep some good nursing material out because they have not gone through four years of high school I would therefore ask that the committee reconsider that point. I make that as a motion—that the committee reconsider it

The motion was seconded

Dr Kosmak, of New York I have been intimately concerned with this question, and it has been my utmost endeavor to simplify the curriculum. The longer I have been in contact with the situation the more impressed I have become with the fact that the girls whom we are admitting to training as nursees have an insufficient groundwork for this training I believe a girl to be a good nurse must have the elements of ordinary education. This question of instituting a four years high school curriculum is not going to be a suddenly advanced matter It will have to be developed gradually We should not lower the requirements but elevate them It is much better to lower the technical requirements at the upper end of the course than to retain those at the lower

Dr Sondern of New York If you attempt to lower the high school education part of the nurse's training you are not going to succeed in the thing that is so essential and that is making a more common-sense professional educational curriculum for the nurse.

Dr Van Etten of the Bronx I feel that the preliminary education of the nurse could be very well regulated so as to provide perhaps a little better preliminary education than they have now We are all in sympathy with a simplification of the technical curriculum and I am heartily in favor of that There is on this floor at the moment the assistant commissioner of education, Dr Sullivan, and I ask you for unanimous consent that he speak to this house for a few moments

Motion seconded, put to a vote and carried

Dr Sullivan addressed the house.

The motion was put to a vote on the question of the committee reconsidering that part of the report dealing with the requirements of the nursing profession, and was lost.

The motion of Dr Thomson to adopt the report was put to a vote and carried

41 COMMITTEE ON MEDICAL ECONOMICS (JOURNAL, MAY 1, PAGE 530)

Dr Flaherty of Onondaga Report of Reference Committee on Report of the Committee on Medical Economics

The chairman of the Committee on Medical Economics in his report suggested the adoption of four resolutions

clause to the resolution with regard to the suspension of the fees of the doctor May I present this as a substitute for the other?

WHEREAS, certain practicing physicians in the State have developed diseases which make it essential for them to give up their practice for a time, and whereas this causes, in the majority of instances, their income to cease and works hardship upon them.

THEREFORE, be it resolved that the State dues of any member shall be suspended by the Medical Society of the State of New York for any member in good standing who has an incapacitating illness of at least three months, provided that his County Society makes application for such remission or suspension of dues, accompanied by a statement that the County Society has so suspended his County dues

The Speaker Dr Chalmers, do you wish to withdraw the previous resolution?

Dr Chalmers This is a substitute.

The Speaker It will be referred to Reference Committee B as a substitute for the previous resolution

34 CARD INDEXES OF MEMBERS OF COUNTY SOCIETIES

Dr Hambrook, of Rensselaer I would like to introduce the following motion

That the State Medical Society furnish its component county societies with suitable card indexes to keep account of its membership This will make the work of county secretaries much easier and provide for interchange of data when members change their address

This was introduced last year and acted on favorably I am making this at the solicitation of many county societies who feel they cannot get the proper men to keep the books under present conditions, and that a card index would facilitate the business very much

The Speaker It will be referred to Reference Committee on New Business A. (Report, Sec. 44)

35 REPORT OF LEGAL COUNSEL (JOURNAL, MAY 1, PAGE 515)

Dr Deyo, of Dutchess—Putnam Your reference committee on report of Legal Counsel has read and carefully considered this report.

We believe that the counsel is to be commended for the constructive articles which have appeared in the State Journal of Medicine

We endorse the policy of the counsel in not settling cases on a nuisance basis, and feel confident in his ability to decide upon the merits of each case This policy has made the legal profession at large realize that only suits of merit can be pushed with any hope of success

We note with considerable satisfaction that during the year there has been a decrease in the number of suits started, and an increase in the percentage of cases disposed of

It is to be regretted that there has been an apparent falling off in the number of those insured under the group plan

In order to lessen the number of cases of malpractice suits brought against the members of the Medical Society of the State of New York, it is desirable for all the members to avail themselves of the Society's plan of group insurance. In order to accomplish this object it is recommended that the matter be referred to the Council to devise ways and means to bring this about. It is also suggested that each County Society appoint a special "group insurance committee" to work with the Council along these lines

I move the adoption of the report

Motion seconded and carried

36 PERIODIC HEALTH EXAMINATIONS AND HEALTH WEEK (SEC. 28)

Dr Douglas, of New York Mr Speaker, the Committee on New Business A, wishes to report on the resolution introduced by the Bronx Delegation

RESOLVED, That a special committee be appointed by the President whose duty it shall be to popularize periodic health examinations, and that a week be set apart to be known as "Health Week" to initiate this campaign

I move that this report be accepted and the resolution adopted.

Motion seconded.
